THE ENCYCLOPEDIA AMERICANA

Locomotive, The. Although there were numerous predictions and suggestions of steam-propelled carriages, notably those of Sir Isaac Newton in 1680 and of others, the first locomotive that deserves the name was that of Richard Trevithick in 1803. True, Cugnot made a steam-driven road wagon in 1769 and Murdoch in 1784, but Trevithick was without doubt the father of the locomotive. He found that plain wheels had sufficient adhesion and that cogs were unnecessary; he used high pressure steam; he turned the exhaust into the stack and on discovering its effect on the fire, called it the "blast pipe." His first engine had four wheels, all drivers, 4 feet 6 inches in diameter. The boiler was 6 feet long and had a return flue, bringing the chimney or stack at the same end as the fire door. There was only one cylinder, but the length made up for two, as it was 8 inches in diameter by 54 inches long. Unfortunately circumstances prevented Trevithick from following up the development of the locomotive and as a consequence many of his ideas have been credited to others. Between Trevithick's engine and the Rocket (1829), which is sometimes called the first locomotive, men had not been idle by any means. Blenkinsop in 1812, Hedley with his Puffing Billy in 1813, Stephenson's Blucher in 1814, Oliver Evans in the same year and others made up the list.

In 1825 the first public railway was opened, the Stockton and Darlington Railway, and George Stephenson was engineer. Its first engine was the Locomotive which was built by Stephenson in 1825. He also built the Hope, Black Diamond, Diligence and Experiment in 1826. Timothy Hackworth's Royal George, a rebuilt engine, went into service in 1827, but none were entirely satisfactory, and a prize of \$500 was offered in 1829 for the best engines. The Rocket, Novelty and Sanspareil entered and the Rocket won, although some claim this was due solely to the failure of the others, caused by poor work or material. This was the famous Rainhill trial which is so often quoted, and in which 29 miles per hour was made. The main dimensions of the Rocket were:

Steam, 50 lbs.
Firebox, 3 by 2 ft.
Tubes, 23 three-inch.
Tubes H. S., 117-75.
Firebox, H. S., 20.
Total, H. S., 137-75.
Weight of engine, 4 tons 5 cwt.

This trial proved the success of the locomotive as a means of hauling loads, and this is probably the main reason that Stephenson has been given credit which belonged to others. In 1828 Horatio Allen went to England for the Delaware and Hudson Canal Co. and bought four locomotives, three from Foster, Rastrick & Co. and one from Stephenson. Stephenson's engine arrived first in January 1829 and was called the America. It had cylinders 9 by 24 inches, a boiler 49 inches in diameter by 9 feet 6 inches long with two fire tubes 19 inches in diameter. The four drivers were 48 inches in diameter, and the cylinders were at an angle of 33 degrees to the horizontal. This engine has a kind of "bar frame." Although the America arrived in the country first, it was not the first to run and for that reason the Stourbridge Lion, the first of the other three engines, is generally considered as the first engine in this country. This engine had cylinders 7½ by 36 inches. The boiler was 48 inches in diameter by 10 feet long. The reversing was accomplished by shifting eccentrics on the axle. From this date the United States began to take a hand in the development of the locomotive, and foremost at this time was the Baltimore & Ohio Railroad. On 4 Jan. 1831 they offered \$4,000 for the best American engine of 3½ tons to pull 15 tons on a level at a 15-mile speed. It must burn anthracite coal, be on four wheels and run on 400 foot radius curves, steam not to exceed 100 pounds. Phineas Davis won the prize with the York, a vertical engine with four 30 inch wheels. Ross Winans was connected with the road as engineer and this experience doubtless aided the work he did in after years as a locomotive builder of no small fame. The "Bury" boiler came into existence in 1832 in the engine Caledonia for the Liverpool and Manchester Railway. In the same year, the Ironsides, Matthew Baldwin's first engine, was put into service in this country. This was the beginning of the Baldwin Locomotive Works, the largest in the world.

Cylinders, 8 x 16½.
One pair drivers, 3 ft. 8½ in.
Boiler, 3 ft. 4 in. diameter, by 6 ft. long.

Large wheels began to be the fad and 7, 8 and even 9 foot drivers were built. The Liverpool was one of the famous Crampton engines with the drivers behind the firebox. The Cornwall was built by F. Trevithick in 1847 and had drivers 8 feet 6 inches in diameter. As originally built, this had the driving axle *above the boiler*. This was afterward changed and the engine was running the 45 minutes express between Manchester and Liverpool as late as 1897,—a remarkable length of service for a locomotive. This attained a speed of 79 miles an hour as early as 1851, while speeds of 75 miles were frequently reported. In 1853 the locomotive superintendent of the Bristol and Exeter Railway built a class of tank engines with 9 foot drivers, which seem to have capped the climax for large driving wheels. A speed of 81 miles an hour has been claimed for these engines and it is said the average consumption of coke was only 21¾ pounds per mile. The first locomotive in England to have a Giffard injector was Ramsbottom's Problem, which was built in November 1859.

Tractive Power.—Tractive power is another name for drawbar pull and shows the amount of horizontal effort exerted by a locomotive. It depends on the steam pressure, size of cylinders and diameter of drivers. The original formula or rule takes into account the area of both cylinders, circumference of wheel etc.; but this has been boiled down by cancellation to the following: Tractive power equals the square of cylinder diameter, times stroke in inches, times mean effective pressure per square inch, divided by the diameter of the driving wheel in inches. Put in the shape of a formula this is:

$$\text{Tractive power in pounds} = \frac{d^2 \times S \times P}{D}, \text{ where}$$

d = diameter of cylinder,
S = length of stroke in inches,
P = mean effective pressure,
D = diameter of driving wheel.

For tractive power calculations, the mean effective pressure is generally taken as 85 per cent of the boiler pressure.

Taking the case of an 18 by 24 inch engine, 68 inch drivers, 200 pounds of steam, and we have

$$\frac{18^2 \times 24 \times 170}{68} \text{ or} \\ \frac{324 \times 24 \times 170}{68} = 19,440 \text{ pounds,}$$

drawbar pull, not allowing for internal friction of engine.

An easy way of reckoning is to remember that the cylinder diameter squared, equals the tractive power for one inch stroke, one pound pressure and one inch driver. Thus in the case above, if the stroke had been one inch, pressure one pound and driver one inch, the tractive power would have been 324 pounds. The actual pressure and stroke are multiplied by this and of course divided by the diameter of drivers, also in inches. From this can be readily seen how the diameter affects the tractive power and why freight engines have small drivers. If one engine has 84 inch drivers and another only 42 inches, other dimensions being the same, the latter will pull twice as much at drawbar, which means that it will start a train of double the size as the first. These calculations do not allow for internal friction.

Driving Wheels.—The number of driving wheels depends on the work to be done. A fast passenger train with few stops is often handled by an engine having but one pair of drivers in Europe and in a few instances in the United States. While the engine may slip slightly on starting, the number of starts are few and there is no friction from side rods, as in coupled engines. Every pair of wheels coupled together means added friction of the side rods, but it also means a reduction of the chance of slipping at the start. A little thought will show that the main pair of drivers are the only ones really driving the engine, unless this pair tends or starts to slip. When this occurs the others take up their share of the work. As this only occurs at the start or on a heavy grade, the extra drivers are apt to be carrying wheels only, the greater part of the time, although the heavy trains now being hauled in freight service give nearly a maximum load to the engine. For an all around engine, the American or eight wheel engine still has the lead, although most modern freight engines have six and eight drivers, while some roads are using 10 wheel passenger locomotives; the great majority, however, are still eight wheelers. The question of weight on drivers is somewhat a disputed point, the generally accepted proportion being four times the maximum drawbar pull, that is, if the tractive power is 25,000 pounds, the weight on drivers should be at least 100,000 pounds. This is because it has been found that this ratio will hold an engine from slipping on a good dry rail. For poor or slipping rails sand is used unless the weight is sufficient, say six times the tractive power.

Although the number of driving wheels generally depends on the adhesion required, there are cases where light rails or poor roadbed prevent the necessary weight being put on the drivers needed for the work. In such cases more drivers are needed, more as carrying wheels than as drivers. In such cases, however, trailing or carrying wheels are used under the firebox. This is done on the Atlantic type of engine as well as on all single driver engines. The question of trucks under the front end seem to have been settled something as follows: Passenger engines on account of high speed, have a full truck to aid in rounding curves at speed. Freight or slow moving engines have a pony or half truck as in the mogul and consolidation engines. This gives the desired guiding of front end of engines and at the same time leaves nearly all the weight on drivers where it can do good work. In European countries freight or "goods" engines rarely have any trucks, all the weight being on the drivers, where it is effective for adhesion. This is possible on account of the roads being comparatively straight, but they would not do on our sharp curves on account of liability to derailment and wear of track.

Locomotive Types.—Classification was formerly accomplished by name only and as these varied somewhat in different parts of the country, the system caused some confusion. F. M. Whyte of the New York Central & Hudson River Railroad has devised a classification by numbers which is very simple, and which is being generally adopted. It consists of three parts to designate leading trucks, drivers and trailing trucks, each wheel counting one, thus 0-4-0

NAMES OF 240 PARTS OF A MODERN LOCOMOTIVE.

1. Pilot.	99. Air Drum.	144. Driver Spring Hanger Brace.	193. Dry Pipe Hangers.
2. Draw Bar Plate.	100. Pump Connection.	145. Pedestal Rail of Frame.	194. Throttle Valve.
3. Coupler.	101. Train Pipe Connection from Pedestal.	146. Lower Rail of Frame.	195. Throttle Valve.
4. Air Signal Hose.	102. Valve Stem Connection from Pedestal.	147. Driving Box Shoe.	196. Throttle Bell Crank.
5. Air Brake Hose.	103. Valve Stem Rod.	148. Driving Box Wedge.	197. Throttle Stem.
6. Hose Hangers.	104. Train Pipe Rod.	149. Wedge Bolt.	198. Done Cap.
7. Guide Beam.	105. Wash Out Plugs.	150. Driving Box.	199. Dome.
8. Flange.	106. Link.	151. Suspension Stud.	200. Dome Casing.
9. Arch Frame.	107. Link Block.	152. Side or Parallel Rod.	201. Safety Valves.
10. Front Frame.	108. Link Block.	153. Main Rod Connection.	202. Whistle.
11. Cinder Chute.	109. Eccentric Connection, Back Up.	154. Main Frame.	203. Whistle Rig.
12. Cinder Chute Slide.	110. Eccentric Connection, Go Ahead.	155. Frame Brace.	204. Ventilation.
13. Extension Front.	111. Link Hanger.	156. Frame Splice.	205. Cab.
14. Headlight Step.	112. Tumbling Shaft.	157. Go Ahead Eccentric.	206. Air Pump Lubricator.
15. Signal Lamp.	113. Tumbling Shaft Lever.	158. Back Up Eccentric.	207. Air Gauge.
16. Number 1 Arch Door.	114. Counter Balance Spring and Rig.	159. Go Ahead Eccentric Rod.	208. Steam Gauge.
17. Smoke Arch Front.	115. Rocker Box.	160. Back Up Eccentric Rod.	209. Steam Turret.
18. Smoke Arch Ring.	116. Rocker Box.	161. Grate Shaking Rig.	210. Injector Throttle.
19. Headlight bracket.	117. Engine Truck Wheel.	162. Back Up Eccentric Rod.	211. Gauge Cock.
20. Headlight Case.	118. Engine Truck Tire.	163. Grate Shaking Rig.	212. Gauge Valve.
21. Headlight Reflector.	119. Engine Truck Axle.	164. Rocking Grates.	213. Air Pump Throttle.
22. Headlight Burner.	120. Engine Truck Brass.	165. Expansion Pad.	214. Throttle Lever.
23. Cleaning Door.	121. Engine Truck Box.	166. Expansion Link.	215. Sand Lever.
24. Deflector.	122. Engine Truck Pedestal.	167. Running Board.	216. Reverse Lever.
25. Deflector Plate.	123. Engine Truck Frame.	168. Air Cylinder Brake Pump.	217. Engineer's Brake Valve.
26. Air Pump Exhaust Pipe.	124. Engine Truck Pedestal Brace.	169. Air Cylinder Brake Pump.	218. Gauge Cocks.
27. Blower.	125. Engine Truck Frame Brace.	170. Air Stray to Drum.	219. Quadrant.
28. Nozzle Stand.	126. Engine Truck Equalizer.	171. Delivery to Drum.	220. Fit Out Valve.
29. Steam Tip.	127. Engine Truck Spring Hanger.	172. Drip Cock.	221. Fit Out Valve.
30. T or Nigger Head.	128. Engine Truck Spring Band.	173. Pump Piston Packing.	222. Cylinder Cock Lever.
31. T or Nigger Head.	129. Front Signal Line Cock.	174. Pump Exhaust Connection.	223. Sight-Feed Lubricator.
32. Deflector or Draft Pipe.	130. Safety Hanger.	175. Pump Steam Connection.	224. Oil Can Shelf.
33. Smoke Stack.	131. Truck Brake.	176. Pump Governor.	225. Hand Hold.
34. Arch Hand Rail.	132. Wheel Guard.	177. Pump Valve Case.	226. Shake Lever Stub.
35. Oil Pipe Plug.	133. Air Signal Pipe.	178. Injector Overflow.	227. Whistle Signal Valve.
36. Cylinder Saddle.	134. Sand Box.	179. Water Pipe.	228. Whistle Signal Valve.
37. Steam Chest Cover.	135. Sand Box Lever.	180. Steam Pipe.	229. Brake Valve Reservoir.
38. Steam Chest.	136. Guide Yoke.	181. Primer.	230. Train Pipe.
39. Relief Valve.	137. Driving Wheel Tires.	182. Water Valve.	231. Signal Pipe Hose.
40. Blower Slide Valve.	138. Ash Pan.	183. Tumble Sheet.	232. Signal Pipe Hose.
41. Valve Yoke.	139. Driver Springs.	184. Sling Strap.	233. Feed Pipe Hose.
42. Valve Stem.	140. Driver Spring Hangers.	185. Stay Bolts.	234. Feed Pipe Hose.
	141. Driver Spring Equalizers.	186. Dry Pipe.	235. Cab Bracket.
	142. Air Drum Bracket.	187. Counter Balance Weight.	236. Counter Balance Weight.

SECTIONAL VIEW OF MODERN LOCOMOTIVE.

LOCOMOTIVE, COALING

indicates no front wheels, 4 drivers and no trailing wheels, a plain 4 wheel switcher. Some leave out the hyphens between the numbers but it is sometimes likely to be confusing, as with the decapod which becomes 2100 without the hyphens or 2-10-0 with them. The following table makes it plain:

Author, 'American Compound Locomotives.'

Locomotive, Coaling of the Modern.

The modern locomotive coaling plant is the product of three primary requirements, namely, reduction in cost of handling the coal; reduction of waste; and saving of time to locomotives at busy terminals and to fast trains on the line.

Twenty-five or 30 years ago it was said that there was probably no work on American railroads which was done in such a variety of ways as that of handling and supplying coal to locomotives. Nearly every road had its own par-

ticular method of doing it, which was usually determined by circumstances, tradition or perhaps prejudice. The importance of using improved methods of handling to enable some more accurate account of the fuel consumption of each locomotive to be kept, and to reduce the cost of handling, was coming to be generally recognized, however. Railroads running through mining districts were regarded as having a great advantage in this respect, as they could have their locomotives coaled direct from the mine chutes, thus minimizing the cost of handling, and at the same time enabling an accurate record of the amounts of coal taken to be kept, as the chute pockets were of known capacity. The best general practice at that time for the larger points was to take the coal from platforms alongside the track, which varied in dimensions and therefore in storage capacity, the figures for the latter ranging from 50 to 1,800 tons. Drop-bottom buckets holding from 1,000 to 2,000 lbs. and filled by shoveling, were lifted by derrick or crane, and their contents discharged into the tender. The larger platforms had a narrow-gage track and a truck on which the buckets were moved to the cranes. The coal had to be handled a number of times, as it was first shoveled from the cars to the platforms, again to the buckets, then moved by hand to the crane, hoisted by hand with the latter and finally dumped into the tender.

But the rapid growth of railroad transportation required that the coal be delivered to the locomotives more quickly and with a reasonable degree of economy, and a variety of devices of greater or less merit resulted. An early form used on the Philadelphia, Wilmington and Baltimore, now a part of the Pennsylvania, consisted of an inclined track alongside the main line, at the top of which was a shed with pockets for storing the coal. Small iron cars ran on narrow-gage tracks on each side, but at a lower level than the track on which the coal was received. A bridge ran across above and at right angles to the main-line tracks, the narrow-gage cars being run out on this bridge and dumped through suitable openings and chutes into the tenders below. It cost the road only one-fourth as much to handle its coal in this way as by previous methods (presumably buckets and cranes), not counting the great saving in time, engines being able to take coal in two and one-half minutes. But the principle toward which the best general practice tended, where the amount of coal handled justified it, was to provide storage for coal in bulk, delivering it to engines by weight or measure from pockets which were at a sufficient elevation to discharge to the tenders by gravity. The Baltimore & Ohio was one of the first to use this form, having it arranged to take coal on either side. The coal-receiving track was about 35 feet above the ground, and 11 or 12 feet below it was a platform about 20 feet wide, on which the coal was dumped. On each side of the platforms were bins 10 or 12 feet wide at the top, with bottoms inclined at about 60 deg. from the horizontal. At the lower end of each bin was an apron held up by counter-balance weights when not in use, but dropped down to about the angle of the bin bottom when the bin was emptied. Four strips were nailed around the inside of each bin to denote

the amount of coal contained, the levels of these strips indicating 1½, 2, 2½ and 3 tons respectively. Engines were charged with the amount of coal taken, each bin being numbered. The platform and bins were not roofed over, leaving the coal exposed to the elements.

In 1885 a committee of the Roadmasters' Association investigated the costs of handling coal by the different methods in use. For handling over platforms of different constructions the maximum was 30 cents a ton and the minimum 11 cents, with an average 19.4 cents. For coal chutes the maximum was 9 cents a ton and the minimum 4.5 cents, the average being 7.4 cents. The average saving in favor of the chutes was therefore 12 cents a ton. The time consumed in taking coal from the chutes was one minute, and from other devices 12 minutes—a saving of 11 minutes per engine coaled in favor of the chutes. Where 3,000 tons were handled monthly there was a saving in favor of the chutes of nearly \$4,500.

Improvements in chutes continued, the effort being to obtain a form that could be worked easily by one man, would have few parts in its construction and could be repaired at small cost. A chief objection to the earlier forms was that the combination of pulleys, chains and balance weights was such as to cause the aprons to close with considerable momentum, racking the entire mechanism and disarranging the working parts. A change to overcome this consisted in pivoting the apron so as to be self-balancing, discarding the chains and weights. This, however, threw a considerably increased weight and strain on these pivots; also the sides of the apron were liable to be pushed out unless supported. Furthermore, the top of the apron had to be locked to prevent its being blown open by a heavy wind. In 1891 the Susemihl chute was introduced on the Michigan Central. Chains and weights were used but they were so adjusted that "the outward pull of the top of the apron due to its vertical thrust beyond the pivot was taken exactly for each position of the apron." Among other advantages, no latches were needed, the inner door being kept closed by the apron as it was lowered, by means of small segmental castings attached to the lower edge of the inner door, over which the lower edge of the apron rose as it descended. Very little iron was used in these chutes, the total cost of iron being only about \$5. The total cost of the structure was said to be much less per pocket than any form then in use by the railroads.

Other designs of chutes with balanced aprons were shortly introduced, the object in each case being to have the vertical resultant of the counterweight vary the same as the weight of the apron. In the Williams, White & Company design the apron arm had fastened to its outer end cast-iron blocks which could be moved forward or back to adjust the proper balance. A small latch at the top held the apron and was pulled by the fireman when he wanted to take coal. The arm of the apron, in rising, came in contact with a latch which released the inner, or coal, door.

The modern method of lifting and transferring the coal by conveyors at locomotive coaling stations was first used in isolated cases

in the early nineties. One of these plants was installed by the National Docks Railway of Jersey City, N. J., for the joint purpose of coaling locomotives and supplying a boiler house. The coaling track was also the coal supply track. The pit beneath the track had an inclined bottom which slid the coal sideways into an underground pit opposite the centre of the structure. The "endless bucket elevator," as it was called, lifted the coal 39 feet and discharged it into bins at the top, the storage capacity being 200 tons. The elevator was driven by an 8-h. p. vertical engine, had 9 inch x 12 inch buckets spaced 12 inches apart, and had a capacity of 85 tons an hour.

As the demand for saving of labor and expense in the handling of fuel for heavy-draft and high-speed locomotives continued, the method referred to in the preceding paragraph was developed and perfected until at the present time the more complete of such plants are not only automatic in operation, reducing labor cost to a minimum, but the coal, which is stored in large quantities is also accurately weighed as it is withdrawn from the pocket, and the weight of the draft automatically registered and printed in triplicate. Also, many of these plants combine with them ash and sand handling facilities, so that a locomotive may have the operations of taking coal and sand and dumping ashes performed without moving, and almost simultaneously. In some cases the standpoint is so situated that water also may be taken without change of position. One of the best examples of a station of this sort was built for the Terminal Railroad Association of Saint Louis prior to the opening of the World's Fair, to enable a large number of locomotives to be cleaned, coaled, watered and sanded at one time. The station was built by the Link-Belt Machinery Company of Chicago. It has a storage capacity of 1,000 tons and is so arranged that seven locomotives can take coal, sand, water and discharge ashes at one time, and 21 locomotives may be cleaned simultaneously. The average number of locomotives handled daily is about 200. Tributary to the 1,000-ton pocket, which is 80 feet long, are 13 auxiliary pockets, each with a capacity of 15 tons and mounted on registering beam scales. There are six of these pockets on each side of the structure and one at the left-hand end. Running between these pockets, and swung from the girders above, is a walk for the scale-tender, who keeps the auxiliary pockets filled, the scale beams being an index to their condition at all times.

Coal is received on two separate tracks and is elevated to the storage pocket by a double system of Link-Belt carriers having a combined capacity of 2,000 tons in ten hours. The arrangement is such that either system may be put out of commission without interfering with the other. Electricity is used throughout for motive power. The loaded coal cars are drawn over the track hoppers and the empty cars removed by a double car-puller, shown in the drawings, having a capacity of eight loaded cars. Each cinder pit will accommodate three locomotives. Where there are a number of locomotives on one track awaiting the service of the station, the first one can take coal, sand and water simultaneously, requiring about four

LOCOMOTIVE, COALING

minutes if a full tank of water is needed. It can then move up to be cleaned, a second locomotive take its place under the station and a third move upon the pit, enabling all three to be cleaned at one time. The station will serve engines headed either way. An independent carrier receives the cinders from the track pits and deposits them in an overhead bin which discharges into a car on one of the coal tracks.

In this same track is a hopper for green sand, which is elevated by a carrier to two overhead circular steel tanks having a capacity of 125 cubic yards each. Each tank discharges into a dryer immediately beneath, the pipe from which passes up through the centre of the tank and assists in drying the adjacent sand. From the dryers the sand is again raised by carrier to the top of the structure and discharged by gravity into two storage bins of 85,000 lbs. capacity each, one being on each side of the station, midway of the tracks. The gravel and other refuse from the sand is discharged into the cinder bin. Water is delivered to the locomotives from two cylindrical tanks above the scale pockets, holding 20,000 gals. each. These tanks are connected to the city mains.

It will be noted that this station is built entirely of steel above the foundations, and covered with galvanized iron. This is not usual practice, timber commonly being used in these structures. Although the steel construction is somewhat more expensive in first cost, the combination of strength and lightness, the greater durability, the immunity from fire and the more pleasing appearance easily justify the additional expense. Several costly stations built of timber have been destroyed by fire and have entailed annoying difficulties and delays until they could be replaced.

The most recent practice is tending away from the combination of the ash-handling and coaling facilities in one plant, it being found more satisfactory in many cases to isolate the ash-handling plant. In a recent example of up-to-date locomotive coaling, sanding and ash-handling facilities, that of the Pittsburgh & Lake Erie at McKees Rocks, the three plants are separate units.

The ability to weigh or measure the coal taken by each engine is regarded as highly important on some roads. If the tender is coaled from buckets or barrows, keeping record of the amount is a simple matter. Marking the insides of pockets to indicate given quantities of coal is another method. For weighing all of the coal in a large storage pocket there are two schemes. One of these is the McHenry dynamometer method. The bin or pocket rests on the top plate of a small chamber filled with a fluid which transmits the pressure through a small pipe to conveniently located pressure gages. By the other method the entire pocket is supported on scales, as in the Saint Louis station described above.

In regard to cost, a committee of the American Railway Master Mechanics' Association, reporting in 1901, expressed the opinion that the expense of coaling locomotives is governed entirely by the kind of cars in which the coal is carried, without reference to the kind of plant in which it is handled, provided the plant is one that will admit of dumping the coal

either to bin or conveyor. If the coal is received in hopper-bottom or side-dump cars, the cost will probably be between one and three cents a ton delivered on the tender, no matter whether the cars are pushed up on an incline and dumped into pockets, or whether a system of conveyors is used. If the coal is received in gondola or box cars and has to be shoveled from the car, the cost will be from six to eight cents a ton delivered to the tender, regardless of the kind of coaling station through which it is handled. The majority of mechanical men replying to a circular of inquiry of a Master Mechanics' committee two or three years ago appeared to prefer the inclined-track coal chute where there is sufficient space.

In 1902 a committee of the American Railway Engineering and Maintenance of Way Association considered carefully the question of coaling stations. A list of the principal factors to be considered in adopting a method was given in that report as follows:

1. The question of location is one of the most important for consideration. This will be governed by the convenience as to the operation of the business of the railroad. At terminals and at junction points, it is probable that large coaling plants will be desired; but at intermediate points on the line coal must be supplied to locomotives hauling freight and passenger trains. The location may determine largely the nature of the plant to be used. Where large quantities of fuel are to be handled with only a limited amount of room for the construction of tracks and buildings, an expensive mechanical plant may be fully justified. At other points where land values are small, a totally different style of plant may be the most economical.

2. The quantity of coal to be handled will also largely influence the character of the plant to be built. Where but one or two carloads of coal per day are required, it is doubtful whether anything but the simplest plant should be built that is sufficient to permit delivering the coal required in the least possible time. On the other hand, where from 200 to 400 tons per day have to be handled, expensive plants, well designed machinery and first-class construction will be justified.

3. A third consideration is the cost of operation. This touches upon the labor question, involving the consideration whether steam engineers, machinists and expert mechanics, or crude day labor shall be utilized in connection with the operation of the plant. In some parts of the country day labor may be had at approximately one-half the rates which are demanded in others. The rate of wages to be paid to the laborer will be an important item.

4. A fourth consideration will be the amount of first cost, and also the cost of repairs and renewals. It is evident that to make a true comparison of the economy of different plants, these items should be reduced to a measure of cents per ton of coal handled, rather than to make a comparison of the gross amounts of actual cost and maintenance.

5. In the same connection, a true comparison will require a consideration of the interest on the cost of the investment, and this also should be reduced to an equivalent value of cents per ton of coal handled.

6. Complicating all of the above is the question of storage. That is a matter of great importance, and that it usually receives but little consideration, is evident from the amounts which are annually spent in storing coal on coal cars and holding the same on side-tracks at coaling stations, rather than constructing suitable storage bins in which the coal may be kept, thus liberating the cars for commercial business.

7. The kind of coal handled will also influence the decision — whether it be anthracite or bituminous, or both, inasmuch as the appliances which are efficient for one kind of coal may be less so for the others.

8. The facilities which each company has for delivering coal to its coaling plants will tend to make the situation more involved, since coal may be handled either in box cars, gondola cars (with stationary or with movable sides or traps), side-dumping or bottom-dumping cars, and other varieties, each of which will have its own influence on the special modification of plant to be adopted for economy.

CHARLES H. FRY,
Associate Editor Railroad Gazette, Chicago.

Locomotive, Design and Construction of the Modern. The various problems involved in the work of designing and constructing a modern, first-class locomotive are both many and complex. In the matter of design, the problems presented by such considerations as cylinders and wheel arrangements, are simple as compared to those relating to boiler power. It is evident that nothing can be gained by employing a large cylinder capacity unless a sufficient supply of steam can be maintained under all of the circumstances liable to be developed under normal working conditions. Therefore, the development of any one type more powerful than another can only be accomplished principally by an increase of grate-area and boiler-capacity.

In this respect, the foreign designers have been badly hampered by the limited character of the loading gauge; but, the limitations governing the matter of dimensions have always been much more liberal in America, so that in the matter of boiler design, American practice has not only reached a stage far ahead of that of any other country, but has also resulted in the replacement of the "American" type of locomotives universally employed on the American railroads prior to 1890, by much larger machines which are capable of developing more than double the amount of tractive power.

In considering the process which goes on within the fire-box of a locomotive, it is found that under favorable conditions, each pound of coal consumed will sustain one indicated horsepower for a period of about fourteen minutes, and that within certain limits the power developed is nearly proportional to the coal consumed. Therefore, in the development of the modern locomotive, the grate-area has been increased and the heating surface extended, thus enabling the burning of a larger amount of fuel, and consequently the maintenance of a larger supply of steam. On the other hand, although the American designer has not been restricted in the matter of dimensions, he has not been able to increase the working capacity of the fireman, so that after all, the power of the modern locomotive has not increased in proportion to its dimensions.

Under the most favorable conditions, a locomotive fireman will handle about 6,000 pounds of coal per hour, a rate which will serve to develop about 1,200 indicated horsepower. At short intervals this amount of power may be increased or out-run the rate of firing, but it fairly represents the maximum amount of power that can be developed under the circumstances, and the further development of the locomotive will depend upon the employment of some form of automatic stoker, which although guided in its operations by a man, will not represent the strength of only a single man.

The considerations relative to grate-areas and fire-boxes naturally lead to the question as to the practicability of obtaining better results by employing other forms of boilers than those in common use. Boilers with cylindrical corrugated fire-boxes such as the Vanderbilt boilers, were first applied to locomotives in the United States. The principal advantages claimed for this type of fire-box are: (1) a free water circulating area; (2) simplicity of construction;

and (3) the elimination of screwed-stays and a copper fire-box. These advantages appear to have been realized in practice, and although boilers of this type are extensively used in this country, their employment in foreign locomotives has not been carried very much farther than a few experimental applications.

The water-tube boilers are another type which promote considerable speculation in this connection on account of their extensive adoption in the stationary and marine service. Many designs of water-tube boilers for locomotives have been proposed, but examples of their successful practical application are still lacking. The principal difficulty of applying a boiler of this type to a locomotive lies in the circumstance that the shell of the ordinary boiler serves as a part of the framework of the locomotive, and as it is not much heavier than the best water-tube boiler of the same capacity, it is impossible to abandon it without materially increasing the weight of the frame.

Besides the matter of the restricted grate-area already considered, another limitation which affected the earlier types of locomotives was that which related to their tractive power. The pull of a locomotive at the draw-bar depends upon its speed. At slow speed the maximum pull is limited by the adhesion or coefficient of friction between the wheels and the rails. After the speed has reached a point at which adhesion is sufficient to permit of the development of full power, the pull is inversely proportional to the speed. In a locomotive developing 1,200 horse-power, the pull at the speed of 25 miles an hour is about 22,000 pounds, and at 80 miles an hour, about 7,000 pounds. The latter amount, however, is still further reduced in actual practice by the usual loss of power between the cylinder and the draw-bar, so that the maximum pull of an engine running at a speed of 80 miles an hour is equal to about 5,000 pounds. On the other hand, in considering the tractive effort at starting, and assuming that the adhesion is equal to about one-fifth of the weight on the drivers, it is noted that the American type of locomotive built prior to 1890, carried a weight ranging from 14,000 to 16,000 pounds on each driver, and exerted at starting, a tractive effort which ranged from 10,000 to 12,000 pounds. It is noteworthy in this connection, that the wheel loads of the modern locomotives have been increased to such an extent that they are capable of developing a tractive force at starting equal to 5,000 pounds per driver, or a maximum of 20,000 pounds for the "American" type of locomotive.

It is also interesting to note, that even this amount is exceeded by the latest type of locomotive placed in service by the Pennsylvania Railroad Company, to haul their 18-hour trains between the cities of New York and Chicago. With the exception of the valve-gear connections, this locomotive is built on lines very similar to those of the "Atlantic" type of express locomotives. It is a simple engine having two outside cylinders 22 inches in diameter with 26 inches stroke, which are connected to four-coupled driving wheels of 80 inches diameter. Under a working boiler pressure of 205 pounds to the square inch, the maximum tractive effort at starting is equal to 25,800 pounds.

Under these conditions it is quite evident, that unless a harder material than the grade of steel now employed, can be obtained for rails and tires, so as to allow a further increase in the wheel loads, a greater tractive power can and will be obtained only by the use of more than four-coupled wheels.

These considerations and facts relative to boiler-capacity and wheel-arrangements, together with the fact that the steam-pressures used on simple engines became equal to and exceeded 200 pounds to the square inch, led to the development of the compound-locomotive. In the beginning, all efforts were directed towards the development of a two-cylinder type, under the impression that the number of parts of a compound-locomotive should not exceed that of a simple-engine; but, in the course of time, all locomotives increased in size without a corresponding increase in the tunnel and station platform clearance, thus prohibiting the use of the large low-pressure cylinders, and terminating the development of the two-cylinder compound.

These conditions led to the development of the four-cylinder compounds of the "Vaulchain" or "Baldwin" type in the United States, and of the "De Glehn" type abroad. The application of the six-coupled wheel-arrangement was extended to the high speed passenger locomotives, and a powerful type of eight-coupled wheel, tandem-compounds was developed for the freight service.

The latest production in the line of powerful locomotives, is the mammoth mountain-climbing engine employed at the present time in banking service by the Baltimore & Ohio Railroad Company on their mountain division over a track composed of the heaviest of grades and numerous curves. It is an articulated compound designed on the "Mallet" principle with the "Melin" system of compounding, and was built at the Schenectady Works of the American Locomotive Company, in 1904. Its wheel arrangement consists of 12 wheels divided into two groups of six wheels each, carrying separate pairs of cylinders—the high-pressure cylinders being employed to drive the rear, and the low-pressure cylinders the forward group of wheels. The forward group of wheels is arranged as a truck which pivots about a point near the centre of the engine. The frames of the forward engine are connected to those of the rear engine immediately in front of the latter by an articulated joint of cast-steel. The boiler is of enormous size—7 feet 2 inches in diameter outside of the smallest ring, and 21 feet in length. The fire-box is 9 feet in length and 8 feet in width, inside measurement. The boiler tubes provide a heating surface of 5,366 square feet, and the fire-box an additional 219 square feet, making a total heating surface of 5,585 square feet, an area more than double that of the largest English locomotive. The grate-area is 72 square feet, and the working steam-pressure is 235 pounds to the square inch. The high-pressure cylinders are 20 inches, and the low-pressure cylinders 32 inches in diameter, with a common stroke of 32 inches. Steam is taken from the dome of the boiler by outside pipes to the high-pressure cylinders and after actuating the pistons therein, exhausts through a receiver pipe, 9 inches in diameter, to the

low-pressure cylinders. Piston-valves 10 inches in diameter are employed in connection with the high-pressure cylinders, and double-ported slide-valves of the "Allan Richardson" type for the low-pressure cylinders. The valve-gear is of the "Walschaert" type throughout. The wheels are 4 feet 8 inches in diameter, and the wheel-base of each group of wheels is 10 feet, so that the total wheel-base of the engine is 30 feet 8 inches. The journals are 9 inches by 13 inches for the axles of the engine, and 5½ inches by 10 inches for those of the tender. The weight of the engine is 144¼ tons, all of which is available for adhesion. Its maximum tractive effort at starting is equal to 92,000 pounds, and it is capable of maintaining a tractive effort of 81,000 pounds at a moderate speed. It is by far the most powerful locomotive in the world, and was designed to meet conditions which included the hauling of trains composed of 50-ton cars, aggregating 2,222 tons in weight behind the tender, at a speed of ten miles an hour on a one per cent., grade around 30° curves and 20° reversed curves, the engine working compound, 315 pounds per ton resistance.

The following list embodies brief descriptions of the construction and operation of the various appliances and principal parts of the modern locomotive. For further information consult also the articles under the titles LOCOMOTIVE ENGINE; LOCOMOTIVE AND ENGINE INDUSTRY; LOCOMOTIVES, COMPOUND; and LOCOMOTIVE, COALING OF THE MODERN, in this Encyclopedia:

- AIR BELL-RINGER.**—Air-pressure connections for ringing the signal bell.
- AIR-BRAKE HOSE.**—The flexible hose connections by which the brake-pipe of the locomotive is attached to that of another locomotive.
- AIR-CYLINDER OF BRAKE-PUMP.**—The lower cylinder of the air-pump which furnishes the compressed-air for setting the air-brakes.
- AIR-DRUM.**—The main air-reservoir. See Main Reservoir.
- AIR-DRUM BRACKETS.**—The flanged plates by which the air-drum is secured in place.
- AIR-GAUGE.**—A pressure gauge provided with two hands, one of which indicates the amount of air-pressure in the main reservoir, and the other one the pressure in the main brake-pipe or train-pipe. In the latter the pressure is usually maintained at 70 pounds as indicated by the gauge, and in the main reservoir somewhat in excess of this amount, so as to ensure the proper action of the valves of the air-pump.
- AIR-PUMP.**—An air-compressing pump which is worked by steam taken from the boiler. It supplies the compressed-air used for operating the air-brakes, and for signal purposes.
- AIR-PUMP EXHAUST-PIPE.**—The pipe which extends from the steam cylinder of the air-pump to the steam-pipes in the smoke-box.
- AIR SIGNAL-HOSE.**—The flexible hose which connects the air signal-pipe in the cab with the air signal-pipe connections in the cars.
- AIR-PUMP LUBRICATOR.**—The cup or arrangement which contains the oil used in lubricating the air-pump. It is located in the cab.
- APRON.**—The sheet-iron plate which covers the space between the locomotive and the tender.
- ARCH-PIPES.**—The steam-pipes in the smoke box which connect the branches of the T-pipe with the steam-chests.
- AXLES.**—The shafts which carry the driving-wheels, the truck-wheels and the wheels of the tender.
- BELL-VOKE or BELL-STAND.**—The cast-iron arch placed upon the top of the boiler, in which the bell is swung.
- BISSEL-TRUCK.**—A wheel arrangement or truck designed to relieve the lateral rigidity in locomotives, and facilitate their travel around curves.
- BLOW-OFF COCK.**—A plug-cock at the bottom of the fire-box, by the opening of which the boiler is blown off or emptied.
- BLOWER-PIPE.**—The pipe in the smoke-box connected with the blower-cock in the cab. By blowing steam

through it, a draft is produced when the locomotive is at rest.

BOILER.—The vessel in which the steam used for driving the locomotive and operating its various auxiliary appliances, is generated.

BOILER-JACKET.—See Jacket.

BONNET.—The wire cap or netting placed over the chimney or smoke-stack to restrain the sparks and cinders.

BOXES.—The bearings which rest upon the journals of the axles.

BRAKE.—The appliance by which a locomotive or a train is brought quickly to a standstill. Ordinarily, it consists of a flexible piece of strap-iron lined with wooden blocking which is applied to the tires of the wheels by means of rods and levers actuated by the pressure of compressed-air, or by hand.

BRAKE-PIPE.—The pipe through which compressed-air is conducted from the various air-reservoirs connected with the air-pump, to the brake-cylinders of the locomotive, the tender, and the cars composing the train. Each car has its own brake-pipe and brake-cylinder. When the cars are made up into a train, these pipes are connected with each other and with those of the tender and the locomotive, by means of flexible hose, and when thus connected, it is called the train-pipe.

BRANCH-PIPE.—The pipe which connects the injector check-valve with the boiler.

BRASSES.—The boxes on the cross-heads and the crank-pins.

BRICK-ARCH.—A slab of brickwork placed across the front end of the furnace, directly over the fire, to hold the smoke and gases in contact with the fire until they become thoroughly mixed.

BUMPERS OR BUFFERS.—Massive pieces of timber bolted to the front end of the engine frame, and to the rear end of the tender.

BUMPER BLOCKS.—Pieces of timber bolted to the bumpers for the purpose of reducing the shock of impact when the cars come together.

BUMPER SHEET.—A sheet of metal placed on the front end of the frame to cover the space between the bumper and the cylinders.

CAB.—The hood or house placed on the back end of the boiler, and over the foot-plate, for occupancy by the engineer and fireman.

CAB HANDLES.—Handles attached to the sides of the cab for the use of the engineer and fireman, in getting on or off the engine.

CELLARS.—Recesses or chambers in the jaws of the boxes, which hold the oil for lubricating the journals.

CENTRE-CASTING.—The cast-iron plate which connects the truck bolster to the front-end of the boiler.

CHECK-CHAMBER.—A chamber attached to the waist of the boiler, through which the water passes from the connecting pipe to the boiler.

CHECK-VALVE.—A wing-valve inserted in the feed-pipe between the feed-pump and the boiler, to prevent the return of the water from the boiler to the pump.

CONNECTING-PIPE.—The feed-water pipe which connects the pump with the check-valve.

CONNECTING-RODS OR MAIN-RODS.—The rods or bars attached to the piston-rods, and by means of which the power developed in the cylinders is transmitted to the driving-axles. They convert the rectilinear reciprocating motion of the pistons into the rotary motion of the crank-pins of the main driving-wheels.

COUNTER-BALANCES OR COUNTER-WEIGHTS.—Large blocks of iron cast on or otherwise secured in place between two or more spokes of each driving-wheel, opposite the crank-pin, for the purpose of balancing the weight of the parallel and main rods, and to steady the motion of the engine by equalizing the forces or moments around the revolving axle.

COUPLER.—See Draw-bar.

COUPLING-RODS.—The rods by which the crank-pins on adjoining driving-wheels are connected together, so as to cause the wheels to revolve in unison.

COW-CATCHER OR PILOT.—A triangular structure of wood, or iron bars, or curved sheet-metal, attached to the front end of the locomotive. It is provided for the purpose of removing stray cattle and other obstructions from the track, and thus prevent them from getting under the wheels.

CRANK-PINS.—The pins or movable journals which unite the connecting-rods with the cranks or shafts of the driving-wheels.

CROSS-HEADS.—Blocks which move in guides and unite the piston and connecting-rods, and slide-blocks together.

CROSS-HEAD PINS.—The pins in the cross-heads to which the main-rods are attached.

CROWN-BARS.—Bars placed on the upper side of the crown-sheet in the water-space, with their ends resting on the edge of the furnace-sheet, to strengthen the crown-sheet.

CROWN-SHEET.—The top sheet of the furnace, to which the crown-bars are attached. It is placed directly over the fire.

CUT-OFF.—The termination of the period of admission of steam into the cylinders. The point of cut-off is regulated by the amount of lap on the slide-valves.

CYLINDERS.—Steam-tight, metal receivers attached to the front end of the boiler on each side of the lower part of the smoke-box. They contain the pistons, which are actuated by the steam obtained from the boiler. There may be two, four, or eight of them, according to the type of locomotive—simple-engine, compound-engine, and tandem-compound engine, respectively. They are called high-pressure, or low-pressure cylinders, according to the manner in which the expansive energy of the steam is utilized therein, and are given the additional designations—outside, or inside cylinders, according to their position relatively to the frame.

CYLINDER-COCKS.—Small cocks placed on the lower parts of the cylinder-ends, to drain off the water of condensation, prior to starting the engine, and thus prevent the possibility of blowing out the cylinder-ends.

CYLINDER-ENDS OR CYLINDER-HEADS.—The front and back ends of the cylinders. The latter hold the stuffing-boxes through which the piston-rods move.

DAMPERS.—The doors in the ash and rear ends of the furnace regulated, by which the air admitted to the furnace is regulated.

DAMPING-HANDLE.—The bar which passes through the foot-plate, and by which the dampers are opened and closed.

DASHERS.—The sheet-iron plates attached to the inside shell of the boiler, opposite the pump-check, to prevent the cold water from drenching the tubes.

DEFLATOR.—A bell-shaped or trumpet-mouthed opening used in the furnace to effect a mixing of the air and gases so as to cause the latter to ignite and thus render the combustion of the fuel more perfect.

DOVE OR STEAM-DOVE.—The elevated, dome-shaped chamber on the top of the boiler, from which the supply of steam for the cylinder is taken. The steam being partially superheated, it is consequently hotter and drier in the dome than elsewhere, and when, used from the dome, diminishes the tendency to priming in the boiler.

DOVE-BODIES.—The sheet-iron jackets which envelop the dome outside of the wooden "lagging."

DOVE-STAYS.—The braces attached to the crown-bars and the dome, to strengthen the dome and the crown-sheet.

DOVE-COVER OR DOVE-TOP.—The covering which encases the dome, and to which the safety-valves and the whistle-stand are attached.

DRAW-BAR OR COUPLER.—The bar attached to the front of the pilot, by means of which the locomotive may be attached to cars or to another locomotive. The name is also applied to the rod or bar by which the locomotive is coupled to its tender.

DRIP-COCK OR DRIP.—The receptacle placed under the gauge-cocks, to receive the water and steam discharged from the cocks, and drain it into a discharge pipe.

DRIVING-SADDLES.—The yokes which straddle the frame and support the driving-springs.

DRIVING-SPRINGS.—See Springs.

DRIVING-AXLES.—The axles which communicate the motion of the connecting-rods directly to the driving-wheels.

DRIVING-WHEELS OR DRIVERS.—The wheels which are attached to the driving axles. The driving-wheel arrangement of a locomotive may consist of the 4-coupled, 6-coupled, or of the 8-coupled wheel type. They form what is called the "wheelbase" of the locomotive. The tractive power of a locomotive is derived from the adhesion of the driving-wheels to the rails, and depends upon the weight of the locomotive and the area of the wheelbase.

ECCENTRIC.—The cams on the driving-axles or crank-shafts of engines by means of which the rotary motion of the axles or shafts is converted into the rectilinear reciprocating motion which operates the slide-valves. This change in motion is effected by giving the cam a definite "throw" or eccentricity equal in amount to one-half of the travel of the valve. A locomotive has two pairs of eccentrics and their attachments. One eccentric of each pair is set on the shaft in such a position that the operation of the valves will run the engine in one direction, and the other one is set so as to operate the valve to run the engine in the opposite direction. They are referred to by various terms, such as "forward eccentric" and "backward eccentric" or "go-ahead eccentric" and "back-up eccentric," according to the direction of the motion given to the locomotive by their action on the valves. The ends of each pair of eccentrics are attached to a "link" by means of which either of the eccentric-rods is engaged with or disengaged from the "rock-

LOCOMOTIVE, DESIGN AND CONSTRUCTION

- ers" connected to the valve by the valve-rods or valve-stems. The links are suspended by the "link-hangers" to the ends of the arms attached to the "lifting" or "tumbling shaft." This shaft has an upper upright arm on the right side of the engine, the upper end of which is connected by the reversing-rod to the reverse-lever in the cab, by means of which the engineer controls the operation of the valves.
- ECCENTRIC-LEVER.**—The projecting portion of an eccentric-strap, to which the eccentric-rod is attached.
- ECCENTRIC-SHEAVE.**—The body of the eccentric or the eccentric itself, which is forged or keyed directly on to the axle or crank-shaft, the throw of which is communicated to the eccentric-strap.
- ECCENTRIC-STRAP OR ECCENTRIC-HOOP.**—The belt of metal which encircles the eccentric-sheave and transmits its motion to the eccentric-rod to which it is attached.
- ENGINEER'S BRAKE-VALVE.**—The air-valve arrangement located on the right side of the cab, by means of which the engineer operates the driving-wheel and other brakes on the locomotive, and also the several sets of air-brakes attached to the cars of the train.
- ENGINE-TRUCK.**—See Truck.
- EQUALIZING-LEVERS.**—Bars suspended at their middle points underneath the engine-frame, and connected at their ends to the springs of the driving-wheels, for the purpose of distributing the force of the shocks or jars that may be received by the wheels.
- EQUALIZING-SPRINGS.**—The spiral or clipical springs on the reverse-shaft, provided for the purpose of equalizing the weight of the links.
- EXHAUST-PORT.**—The middle opening in the seat of each slide-valve, through which the exhaust-steam escapes from the cylinders into the exhaust-pot in the smoke-box. The area of an exhaust-port is usually made to exceed that of a steam-port by one-half, in order to diminish the evil of back-pressure. See Slide-valve.
- EXPANSION-CLAMPS.**—The clamps bolted over the main-frames and the furnace-pads, to allow for the expansion of the boiler under the influence of heat. Also, the clamps bolted to the fire-box under the main-frame to hold the latter against the liners. When the boiler expands, the frames slide through the clamps longitudinally.
- EXPANSION-JOINT.**—A sliding joint provided in the throttle-pipe, or other steam pipe, to allow for expansion and contraction under changes of temperature.
- FEED-PIPE.**—The pipe which conveys the feed water from the feed-pump to the boiler. See Injector.
- FEED-PUMP.**—The force pump which supplies the boiler with feed-water. It forces the water into the boiler against the pressure in the boiler. See Injector.
- FEED-TANK.**—The water tank provided for the purpose of holding the feed-water for the boiler. It is located in the tender.
- FEED-WATER.**—The water used for the supply of the boiler.
- FEED-WATER COCKS.**—Cocks inserted in the ends of the feed-pipe hose-connections, to regulate the supply of water to the pump.
- FEED-WATER SHAFTS.**—Vertical shafts which pass through the foot-plate to the feed-water cocks, and are operated by means of cranks.
- FIRE-BOX.**—The furnace, or that part of the boiler, in which the fuel is burned.
- FIRE-DOOR.**—The door in the back end of the boiler, through which the fuel and the firing-irons are introduced into the fire-box.
- FLAGSTAFFS.**—Iron tubes placed at each end of the bumper or buffer above the pilot, for the purpose of holding the staffs of signal flags or lamps.
- FLUES.**—The tubes in the boiler which carry off the smoke and the waste-gases from the fire-box to the smoke-box, and thus produce the draft necessary for the combustion of the fuel. They are made of iron, or of copper, the diameter of the tubes being kept as small as possible so as to subdivide the volume of the smoke and gases into a large number of small streams, thus exposing them to a large radiating surface, through the medium of which the heat is transmitted to the water surrounding the tubes.
- FOLLOWER-BOLTS.**—The bolts by which the follower-plates are secured to the piston-heads.
- FOLLOWER-PLATES.**—The plates which cover the spring-packing on the front ends of the piston-heads.
- FOOT-BOARD.**—A platform on the back end of the boiler, on which the engineer stands.
- FOOT-PLATE.**—A cast-iron plate bolted to the back end of the frame opposite the fire-door.
- FRAME.**—The strong metal skeleton which supports the boiler, machinery, and axles of the locomotive. It is usually made in two parts—the back part to which the driving-boxes, axles and wheels are attached, being called the main-frame, and the front part to which the cylinders are bolted, being called the front-frame. When formed of plates of sheet-metal, it is called a plate frame, and when composed of iron bars it is called a bar frame. The former is employed in the foreign, and the latter in the American practice.
- FRAME-BRACES OR PEDESTAL-BRACES.**—Strong bars which unite the inner-legs of the main-frame with each other, and the back outer-leg of each frame to the back end of the frame.
- FRAME-SPLICE.**—The connecting arrangement between the front and main frames.
- FRONT-END.**—That part of the locomotive which includes the extended outer-shell of the boiler, comprising the smoke-box and all of the appliances contained therein, such as steam and exhaust pipes, nettings, diaphragms, draft-pipes, and the base of the smoke-stack. The function of the front-end is to draw atmospheric air into the ash-pan, and thence through the grate and the fire-box, and to draw the furnace gases through the flues, and thence under the diaphragm into the smoke-stack, and force them out into the atmosphere.
- FRONT-PLATE.**—A single-bar attachment which extends from the front of each of the main frames to the front bumper.
- FROST-COCKS.**—Cocks provided for the purpose of admitting steam from the boiler to the feed-pipes, to prevent them from freezing in cold weather.
- FROST-PLUGS.**—Plugs screwed into the pump chambers and pump cages to allow the water to drain out and prevent them from freezing.
- FULCRUM.**—The fixed point upon which the levers of the safety-valves are supported, and upon which they turn.
- FURNACE-PADS.**—The knees bolted on the shell of the fire-box, to place the weight of the boiler on the frame.
- FURNACE-RINGS.**—The wrought-iron rings which connect the outside and inside sheets in the water space at the bottom of the furnace.
- GAUGE COCKS.**—The cocks, usually three in number, attached to the back end of the boiler at different heights, which indicate the level of the water in the boiler at any time.
- GAUGE LAMP.**—The lamp placed in the cab, to illuminate the dials and tubes of the various gauges.
- GIB.**—The fixed wedge employed to compensate the wear in the boxes, on the cross-heads, and of the crank-pins.
- GLAND.**—A bush by means of which the packing in the stuffing-boxes is secured in place, to receive the wear of the piston-rod, and to prevent the leakage of steam.
- GLASS-GAUGE.**—A glass tube attached to the back end of the boiler and connected with the steam and water valves, to indicate the height of the water in the boiler.
- GOOSE-NECK.**—A bent pipe of brass, or iron, employed to connect the front end of the feed-pipe with the lower chamber of the pump.
- GOVERNOR OR PUMP-GOVERNOR.**—A valve arrangement connected with the steam pipe and the brake-pipe, or train-pipe, attached to the air pump. It is employed to regulate the action of the pump in operating the air-brakes. It is usually set to maintain a pressure of 70 pounds as indicated by the air-gauge.
- GRATE.**—The area made up of the grate bars in the fire-box, on which the fuel is burned.
- GRATE SHAKING-RIG.**—A bar attached to the movable grate-bars of shaking or rocking grates, by which they are moved back and forth with a rocking motion, thus disturbing the fire over the whole area of the grate, to effect proper combustion. It is operated by means of a suitable lever placed in the cab.
- GUIDE OR GUIDES.**—The attachment or sleeve on the front end of the steam-chest, in which the ends of the valve stems move. Also the piece to which the throttle-valve lever is attached, to prevent it from slipping when the locomotive is in motion.
- GUIDE-BARS OR GUIDES.**—The parallel bars between which the cross-heads move, thus giving a perfectly horizontal motion to the piston-rods. They may consist of two parallel bars, "double-guides" or a single guide-bar, attached to the back head of the cylinder and to a support called the "guide-yoke," a strong plate usually fastened to both the frame and the boiler, and placed across the frame at a point well forward of the front driving-wheels.
- GUIDE-BLOCKS.**—The blocks on the back-head of the cylinders, and on the guide-yoke, to which the guide-bars are attached. In the case of double-guides, these blocks can be played off so as to permit of the guide-bars being brought nearer together when the slides are worn down; or, liners may be placed between the blocks and the bars, which can be removed when it is necessary to bring the guide-bars closer together.
- GUIDE-BRACE.**—A brace attached to the guide-yoke at one end, and to the boiler at the other, to support the guide-yoke.
- GUIDE-YOKE OR GUIDE-BEARER.**—See Guide-bars or Guides.
- HAND-HOLD.**—See Cab-handles.
- HAND-HOLES.**—Openings provided in the outside shell

LOCOMOTIVE, DESIGN AND CONSTRUCTION

- of the furnace near the ring, through which deposits of rust or dirt in the water-jugs of the furnace are removed.
- HAND-RAILS.**—Brass or iron pins attached by brackets or studs to the upper part of the boiler, and extending from the cab to the smoke-box. They are used by the engineer in getting on or off the running-board.
- HEADLIGHT.**—A large lamp placed on the front end of the locomotive to illuminate the track in front and thus disclose any obstructions that may exist thereon, and to signal the approach of the locomotive. It consists of an "oil-reservoir" surmounted by an "Argand" burner, and a parabolic "reflector," all of which are enclosed in a metal "case," which is placed on the top of the smoke-box, or supported on two "brackets," with a shelf between, bolted to the front of the smoke-box.
- HEATER-COCKS.**—Cocks attached to the back end of the boiler, by which steam is blown through the feed-pipes, to prevent them from freezing in cold weather.
- HOLLOW-STAYS.**—Hollow stay-bolts inserted through the inside and outside sheets of the furnace near the crown-sheet, through which air is admitted to the furnace to increase the combustion.
- HOUSE.**—See Cab.
- HOUSE-BOARDS.**—The boards attached to the sides of the boiler, upon which the house or cab rests.
- HOUSE-BRACKETS.**—Brackets attached to the back-bumper, to support the house-boards.
- INDUCTION-PORTS.**—The passages in the valve-seats, through which steam is admitted to the cylinders. See Steam-parts.
- INJECTOR.**—A mechanical device by means of which a continuous supply of feed-water is given to the boiler. It acts on the principle, that if a jet of high-pressure steam issuing from a boiler at a high velocity, is brought into contact with a body of cold water, the steam will partially condense and combine with the water and thus impart a portion of its velocity to the water, and induce a current of water to flow into the same boiler against the pressure of the water in the boiler. Partial condensation of the steam is essential to efficient action. The injector will not feed water too hot to condense the steam.
- INJECTOR OVER-FLOW or INJECTOR-NOZZLE.**—The pipe which connects the overflow-space in the injector. If more water has been supplied to the jet of steam than it is capable of discharging, the excess delivery-tube of the injector, a part of the water will escape through the overflow-nozzle. On the other hand, if too little water has been supplied, air will be drawn in through the nozzle, and carried into the boiler.
- INJECTOR-THROTTLE.**—The arrangement by which the water passage between the steam-nozzle and the combining-tube of the injector is changed in size automatically or by hand, to suit the changes of steam-pressure in the boiler.
- JACKETS.**—The outside coverings of the cylinders and the boiler. The boiler jacket is composed of layers of wood called "lagging" about seven-eighths of an inch in thickness, felt, and Russia iron, placed around the boiler to prevent the loss of heat by radiation and convection.
- JAM-NUTS.**—Lock-nuts used for setting-out the spring-packing in the piston-heads.
- JAWS.**—The parts of the frame formed by the frame-legs, and which hold the axle-boxes.
- JOURNALS.**—That part of the axle on which the weight of the locomotive rests. The journals are situated on the inner side of the wheels, and turn on "journal-bearings" which resist the friction of the revolving axle. The bearings are held in cast-iron or steel boxes called "journal-boxes" or "axle-boxes."
- KEYS.**—The wedges employed to tighten the "straps" which hold the "brasses" at the ends of the connecting-rods. As these keys are very liable to loosen and fall out, they are secured in place either by screws and nuts, or by a set-screw on the other side of the rod.
- KING-BOLT or CENTRE-PIN.**—The bolt or pin which passes through the centre-casting and the centre of the truck, thus making a flexible connection between the engine and the truck, enabling the latter to turn about the king-bolt so as to allow the axles to assume positions approximating the radii of the curves of the track.
- KNUCKLE-JOINTS.**—The joints on the valve-rods, which allow the rods to vibrate freely with the radius of the rocker-arm.
- LIFTING SHAFT.**—See Eccentric.
- LINK.**—A variable-radius expansion-gear by means of which the slide-valves are operated. See Eccentric.
- LINK-BLOCK.**—A block which fits into the curved slot of the link, and moves freely from one end to the other thereof.
- LINK-BLOCK PIN.**—The pin which connects the link-block to the lower rocker-arm of the valve-gear.
- LINK-HANGERS.**—Rods or bars by which the links are suspended to the horizontal arms of the lifting-shaft by two pins, the upper one being attached to the arm, and the lower one to the link-saddle bolted to the link.
- LOWER RAIL FRAME.**—See Frame.
- LUBRICATOR.**—The valve through which oil or tallow is admitted to the cylinders for the purpose of lubrication. These valves communicate with the cylinders either through the steam-chests or through a pipe leading from the cab. The lubricators placed in the cab are called sight-feed lubricators. In these lubricators, the weight of a column of water displaces the oil in the cup, causing it to flow upwards drop by drop, through water in glass tubes, to the pipes leading to the steam-chests. The flow of the oil is thus placed constantly in sight of the engineer, and enables him to know whether the lubrication is continuous and regular or otherwise.
- MAIN-FRAME.**—See Frame.
- MAIN RESERVOIR.**—The main air-reservoir of the locomotive. It is usually located on the front of the main frame, and immediately behind the cylinders.
- MAIN-RODS.**—See Connecting-rods.
- MAIN-ROD CONNECTIONS.**—See Connecting-rods.
- MAIN-ROD FRONT-STRAP.**—See Connecting-rods.
- MUD-DRUM.**—A cylinder attached to the under side of the "waist" of the boiler, to receive the deposits from the feed-water. This material is discharged from the drum by means of a valve called the "mud-cock."
- MUD-HOLES.**—Openings provided in the back end of the fire-box, through which the accumulations of mud in the lower water-space are removed. These openings are usually closed by means of brass plugs.
- MUD-RING.**—The wrought-iron ring which unites the inner and outer shells of the fire-box; completely surrounding the inner shell and closing the water space between the two shells.
- NETTING.**—Wire netting placed in the front end of the smoke-box, and in the chimney or smoke-stack. This netting acts as a sieve, arresting the sparks and cinders, but allowing the smoke to escape freely.
- NOZZLES.**—The contracted tube called the "steam-nozzle" in the injector, through which the jet of steam from the boiler is conducted to the combining-tube of the injector. Also, the outlets of the exhaust-pipes, called "exhaust-nozzles," in the smoke-box.
- NOZZLE-STAND.**—The supports of the exhaust-nozzles in the smoke-box.
- NOZZLE-TIPS.**—The rings or bushes fitted into the tops of the exhaust-nozzles. They are held in place by means of set-screws so as to permit of their being readily removed and others with larger or smaller openings substituted, to adjust the size of the blast orifices so that they will be small enough to produce the required draft, and yet be as large as possible to reduce the amount of back-pressure.
- OIL-CUPS.**—Cylindrical metal receptacles with glass linings, employed to contain oil, and to distribute it to moving contact surfaces, for the purpose of lubricating them. Such cups are attached to the guides and the connecting rods above the bearings and the crank-pins. The oil-cup for lubricating the main or slide valves is placed in the cab where it is under the control of the engineer. See Sight-feed Lubricator.
- PACKING.**—The hempen, metallic, or other substance used in the stuffing-boxes, and in the steam and pump cylinders, to make the moving parts of the pistons steam and water tight.
- PETTICOAT or DRAFT PIPE.**—The pipe through which the exhaust-steam is conducted to the exhaust-nozzles in the smoke-box, thus creating a partial vacuum in the smoke-box, which sucks the smoke and gases out of the flues with great power, and forces them out into the open air by the blast or the action of the exhaust steam.
- PILOT.**—See Cow-catcher.
- PISTON-HEAD.**—The solid or hollow disc-like plunger in the cylinder which is moved with a reciprocating or forward and backward movement by the action of the steam, thus converting the energy of the steam into the motion which drives the engine.
- PISTON-PACKING.**—The packing by means of which the piston-rods are made steam tight.
- PISTON PACKING-RINGS.**—The rings of cast-iron, wrought-iron, steel, or gun-metal which form the peripheral portions of the piston-heads, and make a steam-tight joint between the piston-heads and the inside surface of the cylinders. They are made thin and turned slightly larger than the bore of the cylinders, and thicker on one side than on the other so as to act as a spring when they are slotted diagonally across and forced into the cylinders between the piston covers. After being placed in position, their elasticity tends to thrust them outwards and thus maintain a steam-tight joint with the bore of the cylinder.
- PISTON-ROD.**—The rod attached to the piston-head, and

LOCOMOTIVE, DESIGN AND CONSTRUCTION

by means of which the motion of the piston-head is communicated to the connecting-rod or crank. It works through a packed stuffing-box which prevents the leakage of the contents of the cylinder.

PRIMER.—The valve by means of which the air in the water-space of the pump is expelled, and a partial vacuum produced so as to cause an inflow of water to start the action of the pump.

PUMP-GOVERNOR.—See Governor.

QUADRANT.—A slotted curved bar which holds the reverse-lever in the proper position by means of a reverse-latch. Also, a toothed bar located in the cab, by means of which the variable-exhaust is regulated.

RADIAL STAY-BOLTS.—Stay-bolts screwed into the outer shell of the boiler radially to its cylindrical form, and as nearly as possible at right-angles to the surface of the crown-sheet which they are designed to support.

RADIUS-BAR.—The angle-bar attached to the back end of the truck frame and to the radius-bar cross-tie by means of a pin.

REACH-ROD.—The rod which connects the reverse-lever with the reverse-arm of the reverse-shaft.

RECEIVING-PORTS OR STEAM-PORTS.—The passages in the seats of the slide-valves through which the steam is admitted to the cylinders from the steam-chests.

REVERSE-LATCH.—The tongue which fits into the notch of the quadrant by which the reverse-lever is held in the right position.

REVERSE-LEVER OR REVERSING-LEVER.—The lever by which the direction of motion of the locomotive can be changed, and the travel of the valves increased or decreased. It is located in the cab within easy reach of the engineer.

ROCKERS.—The double-cranks connected with the link-blocks at one end and the valve-rods at the other, and through which the valves receive the motion of the eccentrics and links.

SADDLE-PIN.—A pin by which the link-hangers are attached to the saddle-plate, and by means of which the link is raised or lowered.

SADDLE-PLATE.—The plate which fits into and slides in the slot of the link.

SAFETY CHAINS.—Chains employed to couple the locomotive to the tender, in addition to the attachment effected by means of the draw-bar, as a safeguard in case of the fracture of the latter. They are attached to the safety-hooks bolted to the back-bumper of the locomotive.

SAFETY-HANGERS.—Chains fastened to the front-bumper and to the front end of the truck-frame, to prevent the truck from swinging around and breaking the links in case the locomotive happened to run off the track.

SAFETY-VALVES.—Spring-valves attached to the dome-cover, by which the steam-pressure in the boiler is prevented from exceeding a certain limit. Usually there are two of these valves, so as to provide against the contingency of the breakage of one of them.

SAND-BOX.—The cylindrical or dome-shaped box attached to the top of the boiler to contain the sand used for the purpose of sanding the rails in order to increase the adhesion, and prevent the driving-wheels from slipping at starting, or when hauling a heavy load, or when running up a heavy grade.

SAND-BOX LEVER.—A lever located in the cab, and which communicates with the rod by means of which the sand-valves are operated by the engineer.

SAND-PIPES.—The pipes on each side of the locomotive through which the sand from the sand-box is conveyed to the rails in front of the driving-wheels.

SHAKE-LEVER STUB.—The cab end of the lever of the grate shaking-rlg.

SIDE-RODS OR PARALLEL-RODS.—See Coupling-rods.

SIGHT-FEED LUBRICATOR.—See Lubricator.

SIGNAL-PIPE.—The air-pressure pipe by means of which the engineer communicates with the trainmen.

SIGNAL-WHISTLE.—A steam-whistle attached to the top of the dome. It consists of an inverted metal cup, usually made of brass, which is placed immediately over the annular opening of a hollow valve-stem screwed into the top of the dome. Communication with the steam-space within the dome is effected by opening or by closing a valve attached to a spindle which extends upwards into the valve-stem. The valve is operated by the engineer by means of a rod which connects the operating lever of the valve with the cab. When the valve is opened, the steam escapes through the annular opening in the valve-stem, strikes against the edges of the inverted cup, and produces the sounds which are utilized to give signals to the trainmen, to warn people off the track, and to signal the approach of the train to stations and crossings.

SLIDE-VALVES.—The valves which control the admission and exhaust of steam to and from the cylinders. They are operated by the rotary motion of the axles of the driving-wheels which is converted into rectilinear reciprocating motion on the valves in the fol-

lowing manner: The steam is admitted through two channels called "steam-passages" which are cast in the cylinder, and terminate in a smooth, flat surface, called the "valve-seat." The valve-seat has two openings called "steam-ports" for the admission of steam and a cavity called the "exhaust-port" which is situated between the steam-ports, and communicates with the open air through pipe connections leading into the exhaust-pipes in the smoke-box. A valve called a "slide-valve," made of cast-iron, and provided with a cavity in its under side, is fitted on the valve-seat in such a manner, that when it is moved backwards and forwards, it will alternately cover and uncover the two steam-ports, simultaneously admitting steam to the front end of the cylinder and exhausting it from the back end, and then admitting the steam to the back end of the cylinder and exhausting it from the front end. This reciprocating motion of the valve is derived from the rotary motion of the driving-axles of the locomotive which is converted into rectilinear reciprocating motion by means of the "eccentric," the "link," the "rocker" and the "valve-rod," placed between the cylinder and the driving axle, and connecting the latter with the stem of the valve.

SMOKE-BOX.—A cylindrical chamber at the front end of the boiler, which is utilized to contain the "arch-pipes," the "lifting-pipes," the "exhaust-pots," the "exhaust-nozzles," the "steam-pipes" and the "exhaust-pipes." It also forms a convenient receptacle for the smoke before it escapes into the open air through the smoke-stack. The "smog" divides the smoke-box proper from that portion of the smoke-box which is commonly known as the "front-end," and into which it opens through the "smoke arch door" in the "smoke arch front." The front-end gives the additional room required to contain the "deflector" and the wire netting which comprise the spark arresting appliances.

SMOKE-STACK.—The chimney through which the smoke escapes from the smoke-box. Smoke-stacks are made in a number of forms, to suit the conditions attending the burning of different kinds of fuel.

SPRINGS.—Bundles of steel plates placed one on top of the other and bound together at the middle by metal bands, and their end connected to the equalizing beams, for the purpose of reducing the effects of the shocks delivered to the locomotive by inequalities in the smoothness of the track. In order to place the weight of the locomotive on the axle-boxes of the driving-wheels, the axle-boxes are arranged to slide up and down in the "jaws" formed by the legs of the frames, and the springs are placed in dome-shaped saddles which rest on top of the axle-boxes. The frames are then suspended to the ends of the springs by rods called "spring-hangers."

SPRING-BALANCES.—The spring attachments in the cab which connect the safety-valve levers to the top-sheets of the boiler.

STACK-BASE.—The lower part of the smoke-stack, by which the stack is attached to the top of the smoke-box. In some forms it is provided with a hand-hole through which the accumulation of sparks may be conveniently removed.

STAND-PIPE.—See Steam Pipe.

STAY-BOLTS. The bolts screwed through the inner and outer shells of the fire-box at frequent intervals, usually about four and a half inches apart, to connect the shells together and enable them to resist the full pressure of the steam.

STEAM-CHESTS.—The boxes located on top of the cylinders, and which contain the slide-valves through which the steam is admitted to the cylinders. A steam-chest usually consists of two castings, the "steam-chest casing" which rests on the top of the cylinder casting to which it is united with a steam-tight joint, and the "steam-chest casing cover," made of cast-iron and

STEAM-GAUGE.—A gauge attached to the back end of held down by bolts screwed into the cylinder casing, the boiler, in the cab, to indicate the pressure of steam per square inch in the boiler.

STEAM-PIPE.—The pipe through which steam is conducted from the boiler to the steam-chests, thence through the openings in the seats of the slide-valves to the cylinders. Starting at the dome, the pipe makes a bend called the "throttle-pipe"; then it extends vertically downwards until it clears the vertical walls of the dome, this vertical part is called the "stand-pipe." The stand-pipe is connected to the "dry-pipe" which extends to the top of the smoke-box where it is connected to the "T-pipe," the branches of which are connected to the "arch-pipes" or "steam-pipes" connecting with the steam-chests.

STEAM-PORTS.—See Receiving-ports.

STEAM-VALVE.—The valve inserted in the steam-pipe connecting the boiler with the injector.

LOCOMOTIVE ENGINE

- STUFFING-BOXES.**—The chambers in the back-heads of the cylinders, through which the piston-rods move.
- SUPPLY-PORTS.**—The openings in the steam-chests through which the steam is admitted from the steam-pipes.
- SUSPENSION-STUD.**—The pin by which the link-hanger is attached to the link-saddle bolted to the link.
- SWING-BOLSTER.**—A swinging bearing in the centre of the truck on which the forward end of the locomotive rests, and which enables it to run around curves easily.
- T OR NIGGER HEAD.**—See Steam Pipe.
- TENDER.**—The carriage coupled to the back end of the locomotive, and used for the purpose of carrying water and fuel.
- THROTTLE.**—The manner in which the steam is admitted to the steam-pipe leading to the steam-chests. It is effected by means of double poppet-valve called the "throttle-valve," placed in the throttle-pipe near the top of the dome. This valve is operated by the engineer by means of a lever called the "throttle-lever" located in the cab, and connected by a rod called the "throttle-stem" to the lower arm of a bell-crank "called the "throttle bell-crank" the other arm of which is connected by a rod to the throttle-valve.
- TIRES.**—The steel bands which form the peripheries of the driving-wheels.
- TRAILING-WHEELS.**—The back pair of driving-wheels in a four-coupled wheel arrangement, or a small pair of wheels placed behind the main driving-wheels where only one pair of driving-wheels is employed. In either case they are located far enough back of the main driving-wheels to provide the necessary room for the fire-box between the two axles.
- TRAIN-PIPE.**—See Brake Pipe.
- TRUCK OF ENGINE-TRUCK.**—The frames, wheels, springs, swing-bolsters, etc., which support the weight of the front of the locomotive. It usually consists of two pairs of wheels held in a frame separate from the main-frame, and attached to the locomotive by the king-bolt or centre-pin, which passes through the "truck centre-casting" and makes a flexible connection, somewhat like the arrangement by which the front axle of an ordinary wagon is attached to the body, which allows the truck to turn about the king-bolt, and thus enables the locomotive to run around curves easily.
- TRUCK-BRAKE.**—The air-brake equipment of the truck, as distinguished from the air-brake equipment of the driving-wheels.
- TRUCK CENTRE-CASTING.**—The cast-iron plate which is bolted rigidly to the transverse bars fastened to the sides of the truck-frame. In a swing-motion truck, the centre-plate is suspended from the transverse bars by links which allow it to swing transversely to the direction of the rails. The king-bolt or centre-pin passes through the centre-plate, and is in some cases provided with a key under the centre-plate, to prevent the locomotive from jumping off the track when running over a rough road-bed.
- TUBES.**—See Flues.
- TUBE-SHEETS.**—The plates at the front and back ends of the boiler in which the tubes or flues are inserted.
- TUMBLING SHAFT.**—See Lifting Shaft.
- VALVE PARTS.**—See Slide-valve.
- VALVE-YOKES.**—The wrought-iron or steel bands placed around the slide-valves in the steam-chests, and to which the valve-stems are attached.
- WAIST.**—The cylindrical portion of the boiler.
- WAIST SHEET.**—A sheet of wrought-iron bolted to the waist by an angle-iron, to which the guide-braces, guide-beaters, and cross-ties are attached.
- WATER-PIPE.**—The pipe to which the feed-pipe hose is connected.
- WATER-TUBES.**—Tubular grate bars used in the water-grates of furnaces burning Anthracite coal. They consist of wrought-iron tubes about two inches in outside diameter, which are attached to the front and back ends of the fire-box at such an inclination as to allow a continual circulation of water through them to keep them cool and thus prevent them from being burned out by the intense heat.
- WATER-VALVE.**—See Injector.
- WHISTLE-RIG.**—See Signal Whistle.

WILLIAM MOREY, JR., C. E.,
Consulting Civil and Mechanical Engineer, New York.

Locomotive Engine, The. In the course of three quarters of a century, a vast wilderness on the American continent has been changed from gloomy untrodden forests, dismal swamps and pathless prairies into the abode of a high civilization. Prosperous states teeming with

populous towns, fertile farms, blooming gardens and comfortable homes have arisen from regions where savage men and wild animals united to maintain sterile desolation. The most potent factor in this beneficent change has been the operation of railroads by the locomotive engine.

Importance of Easy Means of Intercommunication.—Easy means of intercommunication have been properly encouraged by all nations and races that ever have made material progress in the arts of civilization, Lord Bacon says: "There are three things that make a nation great and prosperous—a fertile soil, busy workshops and easy conveyance of men and animals from place to place." That opinion was founded upon an intimate knowledge of the world's history; knowledge of the forces, the institutions and the conveniences that contributed to make nations great.

The need of improved methods of transportation, which so long oppressed the human race, did not produce the steam engine. Grim necessity brought it forth when great properties were falling into ruin, because sufficient animal power could not be concentrated to perform stupendous efforts in limited space. The steam engine was invented when horses could not do the work of pumping water out of valuable mines 500 feet deep. It was a foregone conclusion that the steam engine would be applied to locomotive purposes as soon as increasing business rendered animals unequal to the task of supplying necessary motive power on roads and on water ways. See RAILWAY TRANSPORTATION.

Slow Evolution of the Steam Engine.—After a practical steam engine was put to work on the simple operation of driving a pump, it took half a century of invention to develop it into a motor suitable for driving manufacturing machinery; another half century passed before inventors seriously began the attempt of building a steam engine that could be used to propel a vehicle on land. Far-seeing, progressive men who kept themselves informed on leading inventive achievements were convinced long before steam was applied to land transportation that peripatetic steam engines would be forthcoming when sufficiently urgent necessity would arrive.

When the 19th century opened, Great Britain, more than any other country, needed the use of the steam engine for help in land transportation. Tedious delay occurred before the mill driving engine was applied to vehicles, the principal obstacle being the weight of the ponderous slow moving condensing steam engine which James Watt (q.v.) developed and made popular. A new type was required which in due time was invented by Oliver Evans (q.v.), an American, and utilized by various British engineers. Evans had struggled to interest his own countrymen in his high pressure steam engine but they failed to recognize its merit and refused to aid the inventor. He sent drawings to Europe, hoping that he would be more fortunate with European capitalists. His designs fell into hands that returned no recompense or acknowledgment, but they were used to guide others in building engines that were used for land propulsion.

First Attempts to Produce a Steam Locomotive.—Early in the eighteenth century a variety

LOCOMOTIVE ENGINE

of attempts were made in England to produce a steam locomotive. Richard Trevithick (q.v.), a Cornish mining engineer, built several steam carriages for common roads and one engine to run on rails, but they were all failures although they possessed the elements that would have produced a successful locomotive in the hands of a persistent inventor. The first man to build a locomotive to run on rails and haul cars regularly was William Hedley, chief engineer of Wylam colliery on the River Tyne, near Newcastle, England. His first engine was not a success but his experience with its shortcomings enabled Hedley to build a second locomotive which worked fairly well, and is now to be seen in the South Kensington Museum, London, bearing the name of "Puffing Billy."

This engine (figure 1), which was built in 1813, had a return flue boiler, had upright cylinders and was a sort of grasshopper type of locomotive, which under a variety of modifications

gine, the front pair being the drivers, to which power was transmitted from two outside cylinders placed diagonally across the boiler pointing backwards. The first improvement made was to drop the cylinders to nearly a horizontal position which was followed by the cylinders being placed in the smoke box transmitting the power through a cranked driving axle. Most of the locomotive builders in Great Britain readily recognized the merits of the simple form of engine introduced by the Stephensons and they proceeded to develop the motor on similar lines.

Stephenson's Rocket.—There was no original feature about the Rocket, all the elements having been previously employed by other engineers, but the combination was the work of a master mind and gave to George Stephenson, (q.v) the reputation of being the inventor of the locomotive which is more than his due. When the locomotive is closely analyzed, we find that no proof exists of George Stephenson having

FIG. 1.

became the fashion and held the field up to 1829, when the directors of the Liverpool and Manchester Railway offered a prize for a locomotive that would fulfill certain practical requirements. A variety of locomotives were entered for competition and the prize was awarded to the "Rocket," made by George Stephenson & Son. This engine gave a new type of locomotive to the world which by mere increase of size is the locomotive of the 20th century.

Essential Elements of a Locomotive.—The elements combined to make a locomotive engine successful are a boiler that will generate steam rapidly and simple mechanism that will transmit the power directly to the driving wheels. The Rocket had a multitubular boiler, combustion being stimulated by exhaust steam passing through the smoke stack; and the cylinders transmitted the power to the driving wheels without the intervention of any useless beams or rods and the mechanism could be easily handled by one man.

The Rocket (figure 2) was a four wheel en-

invented anything which became a permanent attachment. The tubular boiler had been applied to a boiler by Marc Seguin, a French railway master mechanic, several years before the Rocket was built, they were used in the United States in marine boilers before Stephenson's time, and the steam jet in the chimney had been used by Trevithick, Hedley, and others. But if Stephenson was deficient in inventive attributes he had the faculty of knowing a good thing when he saw it. He was one of the first men in Great Britain to realize that there was a great future for the steam engine as motive power for land transportation and he persisted in promoting the interests of the locomotive when it had few influential friends. Stephenson was a good representative of the best type of Englishmen. Opinionated and ever pushing his opinions with bull dog tenacity, he made weaker minds yield before his views on railways and locomotives. This was his hobby and he rode it so furiously that the British world was drawn along often against its will. By his dominant will, persist-

LOCOMOTIVE ENGINE

ent determination and forcible arguments, he prevailed on British capitalists to construct an expensive railway for general transportation and induced them to try locomotives when all the scientific world insisted that locomotives were impracticable. He gave his country the glory of originating steam operated railways at the moment when America was almost ready to grasp the prize of honor.

Within a year after the Liverpool and Manchester Railway was opened, a host of other railway enterprises were in progress. The first locomotive almost universally used at that time was carried on four wheels, one pair of small carrying wheels close to the smoke box and one pair of driving wheels in front of the fire box. The boiler was about nine feet long and included an internal fire box about three feet long. The furnace in the Hedley and other early locomotives was located in the internal flue, which in some cases provided the whole of the heating surface; in other cases an addition of a return flue was made. When the Rocket was designed it was determined to employ small tubes to convey the heat of combustion to the water in

wheels in front, a pair of large driving wheels in the middle and a pair of carrying wheels behind. It made a conveniently simply arrangement for light trains. When the single pair of driving wheels were found insufficient to provide the necessary adhesion, coupled driving wheels were introduced. For freight service European locomotive designers at an early day introduced the use of three pairs of wheels coupled with-

FIG. 2.

the boiler, a change which involved the use of a fire box as a furnace. That was made of rectangular section with flat walls which had to be strongly stayed to the outside shell, a water space being provided between the two surfaces. A smoke box with length about one quarter the diameter of the boiler was provided for the passage of the fire gases on their passage to the chimney. In the smoke box was located the opening of the steam exhaust pipe pointing straight through the center of the chimney and acting as a draft inducer. This combination of a multitubular boiler, a fire box surrounded by water and an exhaust steam jet located in the smoke box form the combined elements which make a high speed locomotive a possibility. They were first used together in the Rocket.

Development of the Locomotive in Europe.—The line of development exerted upon the locomotive was increasing the number of wheels and the proportions of boiler cylinders and running gear. In Europe the engine was at an early day provided with a pair of carrying wheels under the foot plate. The wheel arrangement then was one pair of small carrying

out any carrying wheels. That remained almost the universal practice until about 1900 when four pairs of driving wheels coupled began to find favor. On railways on the continent of Europe, British practice was closely imitated for years but in some cases very heavy multi-coupled wheel locomotives were used for freight service. In the British Isles inside cylinders were preferred with a plain slide valve operated by a link motion; on the Continent outside cylinders found most favor and articulated valve motion is more in favor than the link motion.

Genesis of Railroads in America.—The movement in favor of building railroads began in the United States about the same time as it began to influence public opinion in Great Britain. The 19th century had not advanced many years when people in the United States commenced to realize the urgent necessity for good arteries of intercommunication as a means of developing the extensive unsettled territory of the country. Statesmen were aware that the immense regions comprising the Roman Empire had been tied to the central government by a system of magnificent roads. There are numerous long reach-

3. American Locomotive of 1900.

LOCOMOTIVE ENGINE

ing navigable rivers and there are a great many inland lakes on the American continent, but geographically they are far apart and there is no means of reaching vast regions except by land transportation. A series of Appian Ways was the solution of land travel advocated by political leaders. To the ordinary thinker a system of macadam-roads would have solved the difficulty; but such roads were not made to any great extent, for the cost of making them was beyond the means of a thinly populated country where material for road making was frequently very scarce. An agitation in favor of providing a system of canal for inland transportation led to the construction of a great many artificial water ways (see CANALS), but they proved to be a great disappointment. The world of the infant republic could not hold its pace to the speed of the slow moving canal boat, which was prostrated by frost a large part of the time. Some better means must be found to move the increasing volume of merchandise and grain and coal and ore to the centers of consumption. The pinch of necessity wonderfully quickens the inventive faculties. Long before a mile of railroad was built in the United States, the seers, the men of penetrating vision, were discussing

railroad construction was inaugurated in the United States. Crude forms of locomotives had been used in the north of England for about fifteen years but even the scientific world of Great Britain knew almost nothing about them. It is not then surprising that Americans as a rule knew very little about what foreigners had done when they began building railways and their first locomotives were purely of original design. Very little accurate information had reached America concerning what had been done abroad before our people proceeded earnestly with the building of railroads. Before the railroad era there was scarcely any means of circulating scientific information, and few Americans had any idea of how railroads and the motive power for operating the same ought to be built, but that was considered no obstacle; they proceeded vigorously to construct railroads, learning the business over many expensive mistakes. The nation has always been noted for self-reliance, and the pioneer railroad builders pushed along without hesitation, crossing the bridges of difficulty when they were reached. When a portion of the Baltimore and Ohio Railroad was ready for business in 1830, few people believed that locomotives could be built that could oper-

FIG. 3.

the possibilities of the steam engine as a means of accelerating land travel. The high pressure steam engine had been invented by Oliver Evans (q.v.), a native of Delaware, as an improvement of the Newcomen engine. Associated with the Evans engine were ideas of portability that were suppressed in the presence of Watts' ponderous slow-moving engines.

Colonel John Stevens (q.v.), a very influential American citizen, as early as 1812 advocated the use of railroads and in that year published a pamphlet on the superior advantage of Railways and Steam-carriage and Canal Navigation in which he outlined schemes of construction which were not greatly deviated from when actual railroad building commenced. The views of Colonel Stevens began gradually to have supporters and the sentiment in favor of railroad building spread slowly.

Baltimore and Ohio Railroad.—The first practical move of any importance was the building of the Baltimore and Ohio Railroad which was chartered in 1827 and partly opened in 1830. Other railroads were under construction at the same time and 1830 may be noted as the natal year of the American locomotive. Little was known anywhere about locomotives when

ate the road which was remarkably crooked. Popular belief was that hauling railroad cars would be a new line of enterprise for the mule that had supplied motive power to the canals. But Peter Cooper (q.v.), a merchant of Baltimore, considered that the use of steam was essential to make railroad operating a success and he had a small locomotive built to prove the faith that was in him. His engine, the "Tom Thumb," was little more than a model but it developed one and a half horse power and proved that a steam locomotive could be used in operating around very short curves.

Cooper's "Tom Thumb."—The Tom Thumb has an upright multitubular boiler but no claim for originality was advanced for it, as Nathan Read, of Warren, Mass., had patented such a boiler in 1791. The single cylinder was upright and transmitted power to the driving axle through a gear wheel. The engine performed the work for which it was built and for a time its form exercised considerable influence on the designing of American locomotives. Shortly after the experiments were made with Peter Cooper's model, the Baltimore and Ohio Railroad Company advertised, offering a premium of \$500 for a locomotive built in the United

LOCOMOTIVE ENGINE

States which would meet certain specified conditions. The offer brought to the company five locomotives all built at different places, all of original design and all of them practical engines. That which was selected was built by Phineas Davis, of York, Pa. It had upright boiler and cylinders, after Cooper's idea, and was the first in America of a class of engines called "grasshoppers" that were a familiar feature on the Baltimore and Ohio Railroad for many years. The upright boiler and cylinders did not appeal to the mechanical men of other railroads. Most of them had engines built with a horizontal boiler resting on an oblong frame which carried the cylinders and secured the running gear. Even the small engines resting on four wheels were found to act injuriously upon the slender track of the pioneer railroads and the first important improvement effected by American engineers was putting the weight upon three pairs of wheels, two pairs forming the leading truck. This was done in 1832 by John B. Jervis (q.v.), chief engineer of the Mohawk & Hudson Railroad. That leading truck soon came to be a regular feature of American locomotives.

Jervis Invents the Four Wheel Truck.—

engine, which had a pony truck in front consisting of a single pair of wheels and three pairs of driving wheels connected. This gave the means of using a greater proportion of the weight for adhesion than was practicable with a ten wheel engine of the same weight.

Working Out Details.—For many years American railway master mechanics worked on making a locomotive as simple as possible, and the working parts were so proportioned and arranged that the repair expenses would be as low as possible. Various forms of running gear and foundation supports were tried; wooden frames, combined wood and iron frames, outside and inside frames made of iron plate or of iron bars. The fittest to survive were inside iron bar frames which for one decade before the 20th century began were gradually giving way to cast steel. The boiler material for many years was iron with, in some instances, copper fire boxes and brass tubes. The fuel used for the first 40 years of the railroad era was almost exclusively wood, but that became so dear in some quarters that the burning of coal had to be introduced. When that was successfully accomplished it was found that copper fire boxes and brass tubes wore rapidly from the attrition of the hard par-

FIG. 4.

The course of evolution of the American locomotive turned upon methods of making the engines more powerful with due regard for the weakness of the rails the trains had to run upon. For about 20 years after the first locomotive was put to work in the United States, the design worked out by Jervis of a single pair of driving wheels and a four-wheel truck was the prevailing type. Then another pair of driving wheels was added, these being coupled to the main driving wheels, making what was long known as the American locomotive (figure 4). An important improvement effected upon this engine was placing equalizing beams between the driving wheels, which modified the shocks given by imperfect track.

The railroad companies having the haulage of coal, metals and other heavy freight began about 1850 to introduce locomotives of much greater power than the eight-wheel engine and those with six coupled wheels worked gradually into favor. Some companies used six-wheel connected engines without any carrying wheels; but the favorite heavy engine for many years was known as a ten wheeler, its arrangement being a four wheel truck and three pairs of driving wheels coupled. Then came the mogul

ties of the coal. This led to the universal introduction of iron for fire boxes and tubes. The heat generated in a coal burning fire box is so intense that it was found to create blisters and flaws in the imperfectly welded iron. After much careful manipulation a mild form of steel was produced that proved a safe, strong and durable material for fire boxes. When this fact was satisfactorily demonstrated steel took the place of iron and it is still the only material used for locomotive fire boxes on the American continent. The successful use of steel fire boxes led to the same material being used for boiler shells. There again it proved itself superior to iron and all locomotive boilers are now made of mild steel.

The lines of progress then pursued by American railway mechanical engineers were: maintaining simplicity of parts while increasing the proportions for the purpose of making the locomotive sufficiently powerful to meet the requirements of fast and heavy trains. The fragile track over which the early locomotives were operated called for extraordinary care in reducing as far as possible the shocks resulting from the moving of the power-producing machinery, and of the running gear. Counterbalancing the driv-

2. Modern High-speed "Bicycle" Locomotive.

ing wheels and reciprocating parts of the engine received the greatest possible attention, and equalizing beams were introduced at an early day to distribute evenly among the wheels and springs the concussions caused by low joints and other defects of the track. Steel wheel tires that are almost immune from breakage gradually took the place of cast iron and wrought iron, which were originally employed exclusively for tire-making. Experience and theory both having demonstrated that high boiler pressure was necessary to produce economical use of fuel, a high quality of steel was produced for the construction of boilers and furnaces, with the most gratifying results. Steel boiler tubes have taken the place of copper, brass, or iron, and failures from this troublesome part of a locomotive boiler have been reduced to the lowest limits. Not a small part of the increased efficiency of boilers is due to highly perfected appliances provided for feeding the water. Injectors that can be regulated to supply exactly the volume of feed water required have pushed out of service the erratic and unreliable force pump, a change which protracts the life of the boiler by obviating extremes of temperature.

Although it was of the utmost importance for the safety of the public, and of every one connected with the operating of the locomotive, that the boiler pressure should be maintained below a certain tension, serious defects were long common in the construction of safety valves, with the result that boiler explosions were painfully common. In fact, one of the pioneer railway companies advertised that it kept a car loaded with cotton bales next to the engine to prevent passengers from being injured when the boiler exploded. That source of danger has gradually been eliminated, and modern safety valves may be depended upon to prevent the steam pressure rising more than two or three pounds per square inch above the blowing-off point.

The efficiency of the engine has been decidedly improved by setting the cylinders horizontally, thereby providing for direct transmission of power in line with the axles.

In the pioneer days of locomotive building, very little attention was bestowed upon the lubrication of valves and cylinders, an intermittent charge of tallow being considered sufficient, a practice which led to serious loss of power through excessive friction. The attention of inventors was directed to this defect of the locomotive, and a long line of patented lubricators were produced. The latest appliances for lubricating valves and pistons are now so efficient that a constant supply of lubricant is assured.

For many years after locomotives came into use great efforts were made and much expense incurred in giving the engines an ornate appearance. That fashion was gradually abandoned, and severe simplicity of form and modest coloring is more consonant with the character of the modern locomotive.

Sixty-Miles-an-Hour Engines.—When the locomotive had been in use in this country about 20 years, there arose an agitation for engines that would maintain a speed of about 60 miles an hour. Under this demand a number of locomotives were built with a single pair of driving wheels, but the movement toward high speed was short lived. Most of these high speed

engines resembled the English engine, figure 3. The designers of such engines appeared to think that the size of cylinders and driving wheels formed the measure of the speed capacity of a locomotive, but dearly bought experience taught them that the real controlling element is the size of boiler, which, in the engines referred to, was very small. For many years the growth of the locomotive was restricted by the comparatively fragile iron rail. The iron rail wore so rapidly and laminated so badly under heavy or sharp wheel impact, that prudent railroad managers generally restrained other officials in their zeal to increase the hauling power, and therefore the weight, of their locomotives. Until steel rails were introduced the subject of wear of rails was one of extraordinary solicitude to railroad managers.

Steel Rails.—In 1870 steel rails were beginning to be appreciated for their extraordinary wearing qualities. That time may be regarded as the beginning of the movement toward making the locomotive as powerful as it is possible to make a motor which has to run on a rail gauge of 56½ inches and pass under bridges and tunnels about 15 feet high. In 1870 the vast majority of locomotives in the United States were of the eight-wheel or American type, with cylinders 16 x 24 inches, driving wheels 60 inches in diameter, heating surface 900 square feet, grate area 12 square feet, total weight 50,000 pounds. Such an engine was used for all species of service, and was justly considered the best all-round locomotive that had even been employed. The wear-resisting steel rail has permitted locomotive builders to develop the eight-wheel engine until it has become common to carry 20,000 pounds on each driving-wheel, and as much as 25,000 pounds per wheel has been tried. That was beyond the limit of cool journal impact and led to the introduction of more driving-wheels, or a pair of carrying wheels under the foot plate in the highly popular locomotive known as the "Atlantic" or 4-4-2 type.

Increasing the Boiler Capacity.—The development of the boiler to supply steam to cylinders as large as 23 x 32 inches was the result of very skillful and ingenious labor performed by the most accomplished locomotive designers in the country. To produce a boiler of liberal steam-generating capacity it was necessary to increase the grate area. With the eight-wheel engine, which became the object of development, the fire-box was between the frames and the forward and back driving axles. Under these conditions the width could not be more than 34½ inches and the length 72 inches, so that little more than 17 square feet of grate area could be secured. When attempts were made to force these small fire-boxes to their utmost, it became a common practice to urge the fire with such intensity that from 100 to 200 pounds of coal per square foot of grate area would frequently be burned per hour. This was done with great waste of fuel and with destructive effects upon the fire-box. The necessity for an abnormally large grate to burn anthracite coal induced James Millholland, superintendent of motive power of the Philadelphia & Reading Railroad, in 1857, to place the grate above the frames, which gave a material increase of grate surface. Zerah Colburn, in 1854, designed some engines for a road which is now the Delaware, Lackawanna & Western Railroad, with fire-box 7

LOCOMOTIVE ENGINE

feet 6 inches wide and 6 feet long, providing 45 square feet of grate area. These fire-boxes were entirely behind the driving wheels, and the engines were not adapted to anything except very slow service. Millholland modified the Colburn design in a boiler patented in 1862. This boiler had an overhung fire-box, a combustion chamber, and other features that enabled it to burn anthracite coal successfully. In 1877 John E. Wootten, general manager of the Philadelphia & Reading, patented a boiler with a fire-box extending over the driving wheels, which was practically the first of a type now largely used. The circumstances which influenced the designing of boilers with very large grate surface did not move the railroad men in charge of bituminous coal-burning engines until after the advent of steel rails. The rapid increase in the capacity of locomotives that followed the improvement in the track compelled the locomotive designers to devote attention to the increasing of the grate area. This induced them to adopt Millholland's plan of putting the grates above the frames, and to making them as long as possible consistent with the ability of a fireman to cover the front part with fuel. The limit of burning a moderate amount of coal per square foot of grate was again soon reached, because demands for more powerful locomotives continued, and the physical limit imposed by bridges and permanent structures still left some possibility of increasing the size of the engines. The next step to provide a fire-box with increased grate area was made by the Baldwin Locomotive Works in 1895 by the introduction of the "Atlantic" type, 4-4-2, designed by S. M. Vaulchain. In that form the fire-box may be made as wide as a sleeping-car, which enables the designer to use a grate large enough for any locomotive that can be built to meet the restrictions of track and bridges, and may be regarded as final under existing conditions.

Introduction of Compound Locomotives.—American railroad managers have never been exacting in putting restrictions upon the amount of fuel used by locomotives, regularity of service and freedom from break-downs being considered of most importance. But so much had been said and written about the reduction of fuel expense that might result from the introduction of compound locomotives (see *LOCOMOTIVES, COMPOUND*), that various railroad companies began about 1890 to purchase engines of that character. In this year of grace 1904 there are probably 10,000 compound locomotives in use in North America. There are a variety of types, two-cylinder compounds with high pressure cylinder on one side and low pressure cylinder on the other. The four-cylinder Vaulchain compound is more numerous than all the others combined. It has two cylinders on each side transmitting the power through a single cross-head. There are a few tandem compounds in use that have two cylinders in line on each side; and there are a few four-cylinder compounds with two of the cylinders outside on the frames and two cylinders below the smoke-box, the latter transmitting the power through cranked axles. This type of locomotive promises to become the most efficient type for heavy passenger train service. The compound locomotive has not achieved real popularity with railroad men, and, so far, the purpose of their introduction has not been fulfilled. They have not performed

the work of hauling trains at less expense than the simple engine.

About 20 per cent of the fuel placed upon the tenders of locomotives is used for other purposes than that of hauling trains. Part of that is used for raising steam, part for keeping the boiler hot when the engine is not working, and part is wasted through the safety valves and other sources of leakage. This leaves only 80 per cent of the fuel used as a basis for saving by compounding or other improved methods of using steam. The weight of evidence goes to show that the saving effected by compounding is about 8 per cent. If a compound locomotive is not capable of running as many miles per year as a simple engine, a charge of inefficiency will stand against it. Railroad managers complain that the compound loses mileage as compared with a simple engine, and that it is more expensive to keep in working order, so that the saving of fuel is generally overbalanced by other expenses.

Efficiency of Fuel.—An ordinary locomotive develops one horse-power for from 12 to 15 minutes per pound of coal burned in the fire-box equivalent to four or five pounds of coal per horse-power per hour. Engines worked under particularly favorable circumstances may double the duty per pound of coal consumed, while others again will not produce one horse-power short of six or seven pounds of coal per hour. Under favorable conditions a locomotive compares fairly well with a good stationary engine, under the unfavorable conditions of being forced so that the steam passes out of the cylinders at nearly steam-chest pressure, no measure of economy ought to be expected. Predictions are rife that the days of the steam locomotive are numbered, and that electric power generated cheaply in huge central stations will in the near future move the passenger and freight trains now drawn by toiling locomotives. This prophecy may be true, but when the last steam locomotive is consigned to the scrap heap or to the Smithsonian Institution, it will be well to credit it with having performed noble service to the human race.

Reduced Cost of Transportation.—As motive power for the transportation of freight and passengers, the locomotive has steadily increased in efficiency ever since Cooper's "Tom Thumb" wound around the sharp curves of the Maryland hills. At the time that feat was performed the cost of moving flour from Columbia to Philadelphia over a State-made turnpike was 13.51 cents per ton per mile. Transportation was so expensive in regions remote from water carriage as to be prohibitive except for articles of special value. In 1823 John Stevens, of Hoboken, obtained from the legislature of Pennsylvania a charter to build a railroad from Philadelphia to Columbia, in which he was authorized to charge 7 cents per ton per mile. In 1870 the charge for a bushel of wheat per rail from Chicago to New York was 26.11 cents. Under the influence of steel rails and heavy locomotives the rate per bushel of wheat from Chicago to New York had dropped in 1890 to 11.6 cents. An item in "Railway and Locomotive Engineering" says that when the volume of freight was large enough James J. Hill had carried 10 barrels of flour 10 miles for 1 cent. A barrel of flour weighs 196 pounds, so Mr. Hill has carried 1,960 pounds 10 miles for 1

LOCOMOTIVE AND ENGINE INDUSTRY

cent, presumably at a profit. The steady decrease in freight rates will be understood by an examination of the annexed table. The distance from Chicago to New York is about 1,000 miles. The figures in the table apply to any territory for the whole or a part of the distance hauled.

RATES IN CENTS PER BUSHEL OF WHEAT AND CORN
FROM CHICAGO TO NEW YORK.

YEAR	WHEAT		CORN	
	By rail Cents	By rail and water Cents	By rail Cents	By water Cents
1870	26.11	19.58	24.37	19.32
1880	10.8	15.8	17.48	14.43
1890	14.3	8.52	11.36	7.32
1900	10.8		10.1	
1904	11.4		10.6	

Influence of Steel Rails and Huge Locomotives.—The use of steel rails and huge locomotives has exerted tremendously far-reaching effects and has created social revolutions in certain parts of the world. They brought the cereals of regions west of the Missouri River and of the remote Northwest into competition with the grain-raising districts of the Eastern States and with those of Europe, Africa, and Asia.

While inflicting injury and suffering upon the few, progress as represented by Bessemer's great invention and by the enterprise of American railway master mechanics has exercised a beneficent influence upon the many, and the world at large has been a great gainer from the skill and the enterprise of the inventor of a marvelous system of steel-making, of the American mechanic, of the engineer, of the railroad constructor, and of the railroad manager. They have together built a monument to progress which will always be regarded by a grateful people as one of the highest achievements the world has ever witnessed. ANGUS SINCLAIR, *Editor 'Railway and Locomotive Engineering.'*

Locomotive and Engine Industry. Unlike many of the great American industries the history of the inception and growth of locomotive engineering in the United States may be clearly traced from the day when the first locomotive was run upon the rails of the Baltimore and Ohio Railroad. Other lines of rails had previously been laid but they had been constructed for special purposes, and it was not until 1828, when both the Baltimore and Ohio and the South Carolina railroads were started, that there was any system constructed with the definite object of conveying both passengers and freight. The first American built locomotive was operated upon the Baltimore and Ohio tracks, and, although it was nothing more than the mere working model which was constructed by Peter Cooper in 1829, and was not intended for permanent service, it demonstrated the practicability of the invention so conclusively as to prove to the world that railway lines might be operated by locomotive power. In fact, it was largely due to this successful demonstration that the road was finally completed. If the experiment had failed, the project would have been abandoned.

The Peter Cooper model was a little engine with a single cylinder three and a half inches in diameter, with a boiler that was scarcely larger

than that of an ordinary kitchen range, and with tubes that were improvised from gun-barrels. In spite of all the crudities in its construction, however, its trial run was completed so successfully that Peter Cooper, who himself was the engineer, was able to drive his locomotive, which hauled forty-one persons, including himself, at a speed of eighteen miles an hour. Slight as such speed would seem at the present time, it was a great achievement for those days, when the locomotive was so generally regarded as the dream of an impracticable visionary. Moreover, it meant the beginning of the great development of the American locomotive and engine industry.

The first locomotive to be constructed in the United States for actual work was made in 1830. In 1829, however, Horatio Allen had imported a locomotive from Stourbridge, England, for the use of the Delaware and Hudson Canal Company. It was known as the "Stourbridge Lion," and was the first "real" locomotive ever used in this country. The first distinctively American locomotive, the "Best Friend," was manufactured to the order of the South Carolina Railroad by the West Point Foundry. Both of these machines were operated successfully.

It was in 1831 that Matthias W. Baldwin, a manufacturer of bookbinders' tools in Philadelphia, was employed by the proprietors of Peale's Museum, in that city, to construct a model locomotive for exhibition purposes. This was the time when the public excitement over the Rain-hill contests that had been held in England was at its height, and Robert Stephenson's victory with his "Rocket," had made the people very curious to witness the operations of such an engine. To gratify this craving for novelty the museum managers built a circular track, and, upon this, the Baldwin locomotive was operated. His model worked so well, however, that the officials of the Philadelphia, Germantown and Norristown Railroad Company engaged him to construct a larger machine for use upon their lines. This locomotive, which was completed in November, 1832, was named "Old Ironsides." It was a four-wheeled engine, very similar in design to that of the English make, and weighed, when placed on the tracks, a little more than five tons. The rear, or driving wheels, which were fifty-four inches in diameter, were placed on a crank axle; while the cylinders, which were nine and a half inches in diameter, by eighteen-inch stroke, were attached horizontally to the smoke box. The frame was made of wood, while its wheels, which had wooden spokes and rims, were strengthened by the wrought-iron tires and heavy cast-iron hubs. There was no cab, and the tender, which also ran on four wheels, had wooden sides and backs to hold the wood that was required for fuel, and an iron tank, used for carrying water. Roughly made as this locomotive would seem if compared to the beautifully constructed engines of this day, the speed which it was able to attain, with its train of cars attached, was frequently over 30 miles an hour. In September, 1832, the firm of Davis & Gartner, of York, Pa., built three locomotives of the "grasshopper" type for the use of the Baltimore and Ohio Railroad. They were made from designs prepared by Phineas Davis and Ross Winans, and were so serviceable that this style of engine was in use for fully sixty years. Thus, step by step

the locomotive industry was developed. By 1834, the building of such engines had extended to many works in several parts of the country, and such pioneers of railway mechanics as Cooper, Allen, Baldwin, Rogers, Norris, Winans, Campbell, and others, paved the way for the greater achievements of Mason, Cooke, Milholland, McQueen, and Hudson, to say nothing of the countless geniuses whose accomplishments represent the modern development of the art of engine building. In the old days, of course, there was no guide that anybody could follow. There was no such teacher as experience. Moreover as there were few skilled workmen, and practically no shop facilities, the pioneer locomotive builders labored under difficulties which make their success remarkable as the extraordinary achievement of indomitable perseverance.

The early American locomotives were so similar in every essential feature to the engines of English make that it seems quite probable that they were constructed as a close copy of that model. Later, however, the American inventive genius came to the front, exhibiting itself in such radical departures from the imported machine that it was no longer necessary to bring locomotives from Europe. Taking these evidences of development step by step the improvements upon the locomotives of English type were reached in about the following order: The four-wheel swiveling truck, or bogie, was substituted for the pair of fixed carrying wheels in 1832; the cross-head pump for supplying feed water to the boiler was invented in 1833; the half-crank driving axle took the place of the crank-axle in 1834; outside connection to the driving wheels was introduced in 1835; the coupling of two pairs of driving-wheels was patented by H. R. Campbell in 1836; the use of counterbalance weights for the revolving and reciprocating parts was perfected in 1837; the use of lap-welded wrought-iron boiler tubes in 1838; of bar-frames of forged iron with forged pedestals, in 1840; the wooden cabs with glass windows originated during the winter of 1840-41, having been invented in New England, where the excessively cold weather necessitated some such protection for the engine-men; the Baldwin flexible-beam truck was invented in 1842; the connection of equalizing beams with the driving-wheels was perfected by Eastwick and Harrison in 1845; the first "ten-wheel" locomotive, with six coupled wheels and a leading four-wheeled truck was used in 1846; the Mogul locomotive, with six coupled wheels and a leading two-wheeled truck came into use in 1861, while the Consolidation type, consisting of eight coupled wheels and a leading two-wheeled truck, an engine which was designed by Alexander Mitchell of the Lehigh Valley Railroad, was first built at the Baldwin Locomotive Works in 1866. Among the other features of the locomotive which have been added from time to time, and all of which appeal to the eye of the foreign manufacturer as peculiarly American inventions, are the pilot, or "cow-catcher," the bell, the boiler covering of planished or Russia iron, the large headlights, and the directness and visibility of the pipes and other appurtenances. Up to within as recent a time as the early fifties the so-called "American" type of locomotive, with its four coupled wheels and its four-wheeled truck, was the class of engine most generally adopted by railroad men in the United

States. In fact, ever since the day of its first construction by Campbell, in 1836, it had been continuously used for almost every kind of general service—for the carrying of passengers as well as for freight and switching purposes, and it was not until the demand of the public upon the railways increased so greatly as to create the need of more powerful locomotives that special engines for freight service were constructed. It was to meet these requirements that the Mogul and ten-wheel types were adopted during the sixties, and that the Consolidation engines became the standard for the heaviest freight service between 1870 and 1880. During the seventies the use of iron tires and iron rails of light section—the weight usually ranging from fifty to sixty pounds per yard—restricted the weight per axle to a maximum of twelve tons. About 1880, however, came the substitution of steel for iron in the tires. Later came the steel rails, of the heaviest weight possible, and as railway men had already become convinced of the manifold advantage to be derived from the adoption of larger heating surfaces in locomotive boilers, the weight of the engines began to show a marked increase. If, in the beginning, the building of these excessively heavy engines was largely an experiment, it was not long before their practicability had become so well established that their size and weight continued to increase until cars were made that were capable of carrying loads of 50 tons, and locomotives were constructed with more than 30 tons weight per axle. Such powerful locomotives were more costly and difficult of construction, but when the practicable economies in the matter of transportation which were made possible only by the use of cars of such great carrying capacity were taken into consideration the balance was so strongly in favor of the big cars and the heavy, powerful locomotives that railroad men found no reason to hesitate because of the question of first cost.

Since the beginning of the art of locomotive construction in the United States, American engine designers have been actuated by one desire: To produce a machine with sufficient flexibility of wheel-base to enable it to pass sharp curvature and adapt itself to the unevenness of track surfaces resulting from the action of severe frosts, as well as to facilitate the matter of repairs by striving to make every part so accessible that it might be removed without affecting the other parts of the engine.

Among the locomotive-builders whose experiments have contributed to this result and who have also played an important part in the work of increasing the motive power of the American engine, there are several establishments that have either disappeared altogether or that have discontinued the manufacture of this kind of machine to enter lines of business in which the competition was less intense. To speak of these firms recalls such names as the Norris Brothers of Philadelphia, whose work, in the early days of the industry, presented the most active competition to such builders as Baldwin and Rogers. After many business vicissitudes this firm ceased to exist, in 1865, their plant being incorporated in the Baldwin Locomotive Works. In Baltimore, in the old days, there were two works, those of Ross Winans and the Denmeads. Boston had several plants, notably those of Seth Wilmarth, John Souther's Globe

LOCOMOTIVE AND ENGINE INDUSTRY

Works, the McKay & Aldus works at East Boston, and the Hinckley Locomotive and Machine Works, which was one of the representative houses in the industry up to some 25 years ago. In fact, New England has always been a section of the country that was most actively interested in the work of engine building, the principal plants, in addition to those already named, being the works of Ballard Vail, at Andover, Mass.; Corliss & Nightingale, of Providence, R. I., a firm which, although George H. Corliss, the great engine builder, was at its head, proved less successful in the building of locomotives than in other branches of the trade; A. Latham & Company, of White River Junction, Vt.; the Locks and Canal Works, at Lowell, Mass.; the Amoskeag Locomotive Works, at Manchester, N. H.; the Lawrence Locomotive Works, at Lawrence, Mass.; the Taunton Locomotive Works, and the Mason Machine Works, at Taunton, Mass.; and the Portland, Me., Locomotive and Car Company.

Among other sections of the country New Jersey has been a special field for the manufacture of locomotives. The plant of William Swinburne, at Paterson, afterward known as the New Jersey Locomotive Works, and, later, as the Grant Locomotive Works, was one of the offshoots from the Rogers Works. For years it conducted business most successfully, and, finally, in 1885, as the Grant Locomotive Works, when they found that it was impossible to meet the demands of modern requirements with their antiquated shop and their inadequate facilities, they closed their works at Paterson and removed to Chicago, where, after they had reorganized with new capital and thoroughly modern shops, they continued in operation until 1893. The financial depression of that year was too much for them, however, and the entire plant was sold to the Siemens & Halske Electric Company of Chicago. For a time it was operated both for the manufacture of electrical equipment and locomotives, but the business at last proved so unprofitable that the plant was closed. Among the other New Jersey manufacturers of locomotives were Breese, Kneeland & Company, who operated the Jersey City Locomotive Works, and Van Cleeve, McKean & Dripps, whose shops were located at Trenton.

For several years the firm of Eastwick & Harrison built locomotives at Newcastle, Del., and, when they failed in 1840, they were succeeded by the Newcastle Manufacturing Company, a concern that gained both wealth and international fame by their railway operations in Russia. In the West there were several manufacturers of note, some important works being located at Cleveland, Detroit, Milwaukee, Chicago and San Francisco. The Rome Locomotive Works, at Rome, N. Y., started under favorable auspices, but, after several years of more or less disastrous operations, went out of business in 1891.

The Baldwin Locomotive Works, of Philadelphia, has the distinction of being not only one of the pioneers in the business of locomotive manufacture but is still one of the representative establishments in the industry. Established in 1831, by Matthias W. Baldwin, its product has steadily increased until it is now in excess of 200 locomotives a month. The works occupy an area of 20 acres in one of the central parts of the city, and for many years they have given steady employment to more than 15,000 persons.

Another important plant is that of the Rogers Locomotive Works at Paterson, N. J. Founded in 1836, by the firm of Rogers, Ketchum & Grosvenor, the mechanical genius of the concern was Thomas Rogers. When he died, in 1856, the firm was incorporated under the title of the Rogers Locomotive and Machine Works, with Jacob S. Rogers as President, and business was transacted under this name until 1892, when the corporation was again reorganized and when it assumed its present name of The Rogers Locomotive Works. The Rogers Company has an annual capacity of more than 250 locomotives and gives employment to nearly 1,500 persons.

Up to the time of the war with Spain the spirit of consolidation which had already shown its effect in other industries had been an unknown factor in the business of locomotive making. Soon after 1898, however, several of the competing works began to talk of the organization of a larger corporation, or combination, and the movement finally became so popular that, in July, 1901, eight of the large manufactories were consolidated under the name of the American Locomotive Company, with a capital of \$50,000,000, half of which is in common stock, and half in 7 per cent cumulative preferred. The works acquired by the organization were as follows:

	Locomotives per annum.
Schenectady Works, Schenectady, N. Y.	450
Brooks Works, Dunkirk, N. Y.	450
Pittsburg Works, Pittsburg, Pa.	200
Rhode Island Works, Providence, R. I.	150
Richmond Works, Richmond, Va.	150
Cooke Works, Paterson, N. J.	125
Manchester Works, Manchester, N. H.	100
Dickson Works, Scranton, Pa.	85
Approximate total capacity	1,710

In March, 1904, the American Locomotive Company also acquired the stock of the Locomotive & Machine Company of Montreal, Limited, with works in Montreal, Canada, engaged in the building of locomotives and structural steel work. By the addition of the Rogers and the Montreal Works the American Locomotive Company now operates ten plants with a total annual capacity of 3,100 locomotives.

In October, 1905, the company extended its field by the organization of the subsidiary company, the American Locomotive Automobile Company, for the manufacture of automobile vehicles, building a factory for this purpose in connection with the works at Providence, R. I.

Of the ten plants the Schenectady Locomotive Works was established by the Norris Brothers in 1848. In 1863 it passed into the hands of John Ellis, who was eventually succeeded by his sons, John C., Charles G., Edward, William D. Ellis, and Walter McQueen.

The Cooke Locomotive and Machine Company of Paterson, N. J., was established about 1800, but, for nearly half a century they were employed almost exclusively in the manufacture of machinery. In 1852, however, they began to make locomotives, and, as this branch of their business increased, the old shops were abandoned and new and up-to-date works were constructed.

The Pittsburg Locomotive Works began operation late in 1865. Originally intended as a small shop, its capacity being at first limited to 30 locomotives per annum, they were so successful in placing orders for their product that the establishment now occupies an area of fully

LOCOMOTIVE AND ENGINE INDUSTRY

12 acres. In their work of extending their capacity the best of fire-proof buildings have been erected, and the works are equipped with the latest and most improved electric, hydraulic, and pneumatic appliances known to the art of locomotive construction.

The Rhode Island Locomotive Works, at Providence, R. I., commenced operations in 1865, and continued to occupy one of the most prominent positions in the rank of locomotive manufacturers up to the time of their absorption by the combination.

The Brooks Locomotive Works, at Dunkirk, N. Y., was originally intended to serve exclusively as the locomotive building and repair shops of the Erie Railroad. In 1869, however, the railway company decided to abandon these shops. Newer works had already been constructed in a more convenient location for the railway company's purposes and Jay Gould, who was then president of the road, saw no reason why the Dunkirk plant should not be closed. At that time, however, Horatio G. Brooks was the superintendent of motive power and machinery construction for the Erie road. As his home was at Dunkirk, and as all his interests centered about that place, he realized that the removal of these works would prove a severe blow to the prosperity of the town. As the result, he offered to lease the shop and its machinery for the purpose of undertaking the establishment of an independent concern, and as Mr. Gould was nothing loath to make such a mutually advantageous agreement, the lease was signed in November. Before the close of the year 1869, two locomotives had been turned out, and from that time the works were extended until, in 1883, the entire plant, which then covered an area of more than 20 acres, was purchased from the New York, Lake Erie and Western Railroad Company by the Brooks Locomotive Works.

The Richmond Locomotive and Machine Company, of Richmond, Va., was the only locomotive manufacturing plant in the South. When it was established, in 1865, it was intended for the manufacture of plantation and saw-mill machinery, and it was not until many years later that it began to build street cars—horse cars at first, and, finally, motor cars. In 1889, the company secured a contract from the Government to build the machinery for the new battleship Texas, and, although this work was successfully completed, the concern has since devoted its attention almost exclusively to the making of locomotives.

The Dickinson Manufacturing Company, of Scranton, Pa., was established in 1862, and, ever since that time, the concern has been successful manufacturers of locomotives and mining machinery operating two separate establishments in Scranton for these purposes. The locomotive works were acquired by the American Locomotive Company in 1901.

The Manchester Locomotive Works, of Manchester, N. H., have been prominently identified with the locomotive building industry since they were established, in 1854, by Aretas Blood, one of the pioneers in engine construction.

The works of H. K. Porter & Company were established by the firm of Smith & Porter, in 1866. Later the concern was known as Porter, Bell & Company. Although locomotive builders in the strict application of the term, their efforts have been devoted exclusively to such

lines as light locomotives for use in mines, manufacturing establishments, and for all kinds of contractors' and construction work.

From the figures in relation to annual production which have already been given it is not difficult to estimate that the aggregate capacity of the locomotive manufacturing establishments of the country, not including the railroad shops and the shops not regularly engaged in this business, is in excess of 5,000 locomotives. Of course, the demand for such machines varies from time to time, being dependent upon two factors: (1) The general prosperity of the country, a condition upon which the volume of freight to be transported, which is the basis of railroad earnings, so largely depends, and (2) the mileage of new lines under construction, the completion of which means new equipment. In one sense of the word it may be held that these two factors are really one, new lines scarcely ever being built in those periods of financial stagnation when the people are hoarding their money and capitalists are too timid to venture to encroach upon their principal. As the result business prosperity in the locomotive-manufacturing industry is intermittent. As the average life of a locomotive is about 20 years, it requires an annual production of some 2,500 machines to supply the demand that is due to natural conditions, and as the locomotive shops of the country possess a capacity of about twice that number of engines, the difference between these 2,500 and the total production of all the American works, must find an outlet through one of these three channels: They must be used in the equipment of new lines; in the improvement and extension of old lines or they must be exported to other countries. The following table shows the total production from 1895 to 1905, as well as the number exported to other lands than Canada or Mexico.

LOCOMOTIVES PRODUCED AND NUMBER EXPORTED.

YEAR	Total Production Reported.	Number Exported Omitting Mexico and Canada.	Remainder not Exported.
1895.....	1,110	252	858
1896.....	1,175	261	914
1897.....	1,251	338	913
1898.....	1,875	468	1,407
1899.....	2,473	517	1,956
1900.....	3,153	525	2,628
1901.....	3,384	493	2,991
1902.....	4,090	366	3,728
1903.....	5,152	289	4,863
1904.....	3,441	504	2,937
1905.....	5,491	583	4,908
Average.....	2,961	411	2,550

According to the figures given in 'Poor's Manual,' the number of locomotives in use by the railroads of the United States, Canada, and Mexico, during these years, was as follows: 1895, 36,610; 1896, 36,388; 1897, 36,410; 1898, 36,746; 1899, 37,245; 1900, 38,065; 1901, 39,729; 1902, 41,626; 1903, 44,529; 1904, 48,658. In 1905, the establishments representing the locomotive-building industry employed an aggregate of 40,000 men, at a wage which amounted to fully \$25,000,000 per annum. When operated to their full capacity the total value of the products in the United States would be more than \$60,000,000.

Although the American builders of locomotives at first depended upon English models in their work, they were soon able to produce a machine that was capable of attracting attention abroad. The first locomotives exported from this country were sent to the Birmingham & Gloucester Railway in England by William Norris in 1840 and others were supplied to the Royal Wurttemberg Railroad by the Baldwins, in 1845. Three years later the Rogers were called upon to ship some of their locomotives to Cuba, and, since that time, these products of American industry and genius have been sent to almost every part of Continental Europe, even England, with its own resources for engine building having been among the foreign purchasers of our locomotives. Unfortunately, for the sake of the statistics, there are no figures that can tell authoritatively how many locomotives were exported by the United States builders during the early years of the industry, and, as even the later statistics are incomplete, in view of the fact that they do not cover the shipments to Canada and Mexico, it is very difficult to obtain anything like a comprehensive idea of the subject. According to the best figures obtainable, during the 26 years that elapsed between 1879 and 1904 inclusive, no less than 6,173 were sent to foreign countries from ports in the United States, while their value was placed at \$57,843,005. We are also aware that, at the present time, American locomotives are not only in use in almost every part of the world but that they are constantly being shipped to almost every inhabited portion of the globe.

One excuse for England's remarkable interest in American locomotives may be found in the labor conditions that have existed from time to time in that country. Thus, in 1898, when the Midland, the Great Northern, and the Great Central railroads together ordered no less than 80 of our machines, 70 from the Baldwin works and 10 from the Schenectady works, they were somewhat compelled to resort to this method of relief. All through the year 1897 the engineering works of Great Britain had been affected by a strike, and, in 1898, when the men finally returned to their work, the several plants were so overcrowded with orders that it was impossible for them to meet all the demands that were made upon them. Naturally, when the American locomotives appeared they were subjected to all sorts of adverse criticism by the British builders. Efforts were made to show that they could not be compared to the English machines, either in point of speed, or in matter of economy, but as the statements made were all biased and inconclusive, the American manufacturers have not taken them greatly to heart, especially in view of the fact that they are constantly being called upon to furnish machines for use in various parts of Asia and Africa, where, coming into direct competition with the English product, the railroads have had an opportunity to test the truth of such charges.

In 1832, the Philadelphia, Germantown and Norristown Railroad Company paid Matthias W. Baldwin the sum of \$4,000 for the locomotive, "Old Ironsides." From that time the price charged for such machines slowly but steadily increased until, during the period of the Civil War, sums ranging from \$30,000 to \$35,000 were received for the heavy freight or passenger locomotives. Of course, locomotive building was

no exception to the other industries, and, after war times, the prices of its product declined to about \$7,000 for a 35-ton passenger locomotive. This was the price that prevailed about 1879, and while, during 1880 and 1881, prices rose rapidly until fully \$15,000 was paid for a similar machine, they declined gradually until 1896, for while it is true that from \$8,000 to \$9,000 was paid for an average passenger locomotive, and from \$9,000 to \$10,000 for an average freight locomotive at that time, the fact that there had been a constant reduction in the price per pound indicates conclusively that the actual price for the entire engine was due to the fact that the weight of the locomotives had continued to increase, to meet the greater demands of traffic conditions.

The introduction of the 50-ton steel car, in 1897, brought about a marked advance both in the weight and the power of the locomotives. To meet this new demand the weight of the ordinary consolidation freight locomotive, which had ranged from 60 to 70 tons, was increased to 80 to 100 tons, while some of the machines that were constructed were as heavy as 115 tons, exclusive of tender. As such an increase of weight and power had been inspired solely by business conditions, the railroads were quick to respond to such an evidence of prosperity by ordering the kind of rolling stock that was necessary to enable them to meet these new requirements and which would just as certainly increase their own earning power. In 1897 materials cost more than they do to-day, and, wages were higher. Taking these facts into consideration it is by no means surprising that the construction of such heavy locomotives should have brought the price to \$15,000 or \$16,000.

It was a similar demand for more powerful locomotives, for engines not only capable of hauling heavy trains at sustained high speed, but also of accelerating speed rapidly after starting, that brought, the new and heavier types of passenger locomotive into existence. The old American, or eight-wheel type, was wholly incapable of meeting such requirements. The ten-wheel engine, which had hitherto been used quite successfully on heavy grades, proved unsatisfactory in such an emergency, owing to its comparatively small driving wheels, its inadequate firebox, an adhesion considerably in excess of the requirements, and excessive resistance within the machine itself. To overcome these difficulties the Baldwin Locomotive Works constructed the Atlantic type of engine. It was substantially a ten-wheel locomotive, in which the rear pair of driving wheels was replaced by a pair of trailing wheels of smaller diameter, permitting the introduction of a deep firebox with ample grate area and volume sufficient to admit of thorough combustion. Great boiler capacity was available in proportion to the adhesion; the driving wheels were closely coupled, and the total wheel base was sufficiently long to give smoothness of motion at high speed, and, at the same time, sufficient flexibility.

Fuel economy is one of the most important factors in the running of locomotives, and it was the railroad men of Europe who were first to experiment along such lines by the use of the compound locomotive. Among those who may be mentioned as leaders in the movement

LOCOMOTIVE AND ENGINE INDUSTRY

for the development of the compound locomotive were Lindner, Von Borries, La Page, Worsdell, and Webb. In the United States a two-cylinder or cross-compound locomotive had been designed by W. S. Hudson of the Rogers Locomotive Works as early as 1873. The engine was never constructed, however, and it was not until 1882, when the four-cylinder tandem compound locomotive designed and patented by Henry D. Dunbar was tested on the tracks of the Boston and Albany Railroad that such a machine was operated in this country. Even then, however, the matter was dropped for a time, and when, in 1889, the Pennsylvania Railroad imported one of the Webb compound locomotives the object was entirely an experimental one. It was during the same year (1889), that Samuel M. Vauclain, the superintendent of the Baldwin Locomotive Works, completed his design for a four-cylinder compound locomotive, in which the high-pressure and the low-pressure cylinders were placed one above the other on either side of the locomotive, both being formed within a single casting, together with the steam-chest, an arrangement which enabled them to occupy the same space as had formerly been devoted to the ordinary single-expansion cylinders. The two piston-rods were connected with a common cross-head, but, back of the cross-head pin, there was practically no change from the mechanism of the ordinary engine. A little later another two-cylinder or cross-compound locomotive was invented by A. J. Pitkin, the superintendent of the Schenectady Locomotive Works. This machine had a form of intercepting-valve differing from those which had hitherto been used, either here or abroad.

In 1902 the Baldwin Locomotive Works built their first balanced compound, to the designs of S. M. Vauclain. Since that time about 160 of these engines have been constructed. A few locomotives of somewhat similar design have been built by the American Locomotive Company to the designs of Mr. F. J. Cole. Altogether there have been built in the United States over 4,000 compound locomotives.

As has been stated, Peter Cooper's first model attained a speed of 18 miles per hour. According to statements that ought to be regarded as reliable Baldwin's "Old Ironsides" once attained a record speed of 60 miles an hour for a short distance, and other examples of the high speed had several times been shown by the old-time locomotives. In fact, the real progress in locomotive development in the United States had not been marked by an increased capacity for speed so much as by an increased hauling power. Instead of designing locomotives capable of breaking the speed record the American builders had been endeavoring to construct locomotives that would draw heavy trains at a steady rate of speed, and in this effort their success had been phenomenal. In fact, up to 1880, there had been no demand for an engine of greater speed than 50 miles an hour, and it was not until the compound system was introduced that locomotives were expected to exceed that limit. From that time, however, the matter of speed became a factor in the building of locomotives, and these are some of the results obtained by American-built engines:

In November, 1892, locomotive No. 385—

one of the Vauclain compounds—running on the Philadelphia and Reading and the Jersey Central railroads, between Philadelphia and Jersey City, with a train of four heavy cars attached, attained a speed equal to 97 miles per hour, by covering one mile in 37 seconds. On May 10, 1893, locomotive No. 999, on the New York Central Railroad, attained a speed equivalent to 112½ miles an hour, by hauling the Empire State Express, with its four heavy cars, a distance of one mile in 32 seconds. On July 19, 1893, locomotive No. 682, on the Philadelphia and Reading Railroad, accomplished the remarkable feat of hauling a train of nine heavily loaded passenger cars from Winslow Junction to Pleasantville, a distance of 26 miles, in 22 minutes, which was equivalent to the rate of 70.9 miles per hour. On August 27 the same locomotive succeeded in hauling 17 loaded passenger cars the same distance in 27 minutes, or at the rate of 57 miles per hour, a performance which was even more remarkable, considering the weight of the train attached.

On September 11, 1895, the Empire State Express, on the New York Central Railroad, with its four cars, ran from New York to East Buffalo, a distance of 436½ miles, in 407¾ minutes, this being an average speed of 64.26 miles per hour. While these runs have been exceptional exhibitions of speed, since 1896, the Philadelphia and Reading Railroad has been operating, during the summer months, a service by which trains of five or six passenger cars have been hauled between Camden and Atlantic City, a distance of 55½ miles, in 48 minutes, and these runs have been made with great regularity. The locomotives used for this purpose have been of the Atlantic type, with Wootten boilers and 84-inch driving wheels.

On July 9, 1905, what is known as the Scott Special, on the Atchison, Topeka and Santa Fe Railway, left Los Angeles for a continuous trip to Chicago. The distance of 2,245 miles was covered in 43 hours and 55 minutes, making an average of 52 miles per hour for the entire distance, the highest speed officially recorded for a given distance being at the rate of 106.1 miles per hour.

Although the ancient records are somewhat vague in reference to the matter, it is generally believed that the first experimental steam engine ever built in the United States was constructed by Christopher Colles, a lecturer before the American Philosophical Society, at Philadelphia, in 1773. Beyond this fact even tradition is silent until we come to 1787, when John Fitch launched, on the Delaware River at Philadelphia, a steamboat, which, being propelled by paddles, was capable of attaining a speed of 13 miles per hour. In 1796 he experimented in New York waters with a boat operated by means of a screw. His experiments were closely followed by the more practicable ones of Robert Livingston, while Samuel Morey, Nathan Read, Nicholas Roosevelt, Oliver Evans, John Stevens, and of course, Robert Fulton were among the pioneer-mechanics who devoted their attention most closely to steam navigation.

The history of transatlantic steam navigation dates from the year 1819, when the American steamer "Savannah" made its first trip from Savannah to St. Petersburg, and the progress in ocean transportation, which has been almost too great to be calculable, has been due almost

entirely to the development of the marine engine through its several forms of single, double, triple, and even quadruple expansion cylinders. It is a long step from the slow old "Savannah," with her crude mechanism, to the magnificent ocean palaces of our time, some of which have a speed ranging from 500 to 600 miles per day, but much of the credit for this development must always be given to such master minds of the early days as John and Robert Stevens, John Ericsson, the Copelands, Robert Thurston, and James P. Allair.

While there have been many improvements in the art of engine-building since 1850 they have applied to the details of construction rather than to any marked change in type. In American engine-building, at least, the efforts of the engineer have been to secure high efficiency with the greatest possible degree of economy. Thus the introduction of the invention known as the Corliss valve gear was hailed with delight by all who were interested in the development of engine building. This is a device by means of which steam is admitted into the cylinder for any desired portion of the stroke, while the point of cut-off, which is automatically maintained by the governor, does not in the least affect the free opening of the exhaust. Of course, this was not the first attempt that had been made to use the steam expansively. Many devices had been introduced before this time, and one of them was used quite generally throughout the country between 1841 and 1849, at which time George H. Corliss brought out his improvements upon the expansion gear. The older invention was the achievement of Frederick E. Sickles. It consisted merely of a drop cut-off with detachable valve gear.

The adoption of the surface condenser must also be regarded as one of the great improvements of practical utility in the economy of the style of engine to which it is adapted. From one end of the country to the other, however, there was an ever-increasing call for engines which, while they were smaller in size, would be capable of developing greater speed and higher steam pressure. As early as 1823, Jacob Perkins, one of the pioneer engine builders, began to experiment with high pressures, and, in 1827, he constructed a single acting engine in which steam of 800 pound pressure was used. A few months later he so far improved upon his previous results as to construct a compound on the Wolfe plan in which he was able to secure a pressure of 1,400 pounds, expanded eight times. So assured was he of the practicability of his discoveries that he was willing to propose to adopt a pressure of 2,000 pounds, using engines of small cylinder dimensions and cutting off the admission at one-sixteenth of the stroke. While these excessive pressures were not adopted at the time, the results of Jacob Perkins' experiments were of the greatest value in later years, when engine-builders were ready to consider the greater economy of high pressure steam, for as soon as the public realized that such power could be adopted their demand for engines in which such high pressures could be utilized to secure a high rate of speed compelled the builders to devise some means of meeting these requirements. A number of these designs were made and some of the engines were constructed. The most noted of these, the Westinghouse, is a double-

cylinder, single-acting engine, and has come into very extensive use by reason of its low cost and simplicity as well as for its high degree of efficiency.

During the past few years the steam turbine has attracted a great deal of attention owing to its remarkable capacity, both for economy and for wide range of load. In the engines of the turbine type the steam is converted into power through the impact and reaction due to its velocity, which is materially increased by liberation and expansion. The advantages which it presents over the ordinary steam engine are to be found in its continuous rotative action; in the absence of dead centres and the mechanical complications that are consequent thereto, and in the absence of the strains suddenly applied and reversed which are absolutely unavoidable in a reciprocating engine. There are two turbine systems at present in use. One is the De Laval; the other is the Parsons.

The De Laval system is based on the principle of the axial jet turbine water wheel, the jets of steam being brought into contact with the blades of the turbine wheel, at the proper angle, and passing through to the discharge. To obtain the greatest effect it is necessary that the turbine should reach a high rate of velocity, which is sometimes as great as 30,000 revolutions a minute, but this excessive rate may be reduced to a more normal speed by a cleverly devised system of gearing.

The Parsons steam turbine, which is manufactured by the Westinghouse Company, differs in many respects from the De Laval system. For example, the main armature, or drum, may be run at a lower rate of speed with practically the same economical results. The cylindrical steam chamber, which has a varying internal diameter, is provided with numerous rows of curved guide plates, or vanes. Central drums, which show a corresponding varying diameter, and to which are secured several rows of blades, so arranged as to fit between the stationary vanes, form the rotating portion, and its shaft is so devised that it may be coupled direct to the armature of a dynamo, or may receive a pulley for belt drive. Thus the steam, which is introduced at the small end of the cylindrical chamber, is guided in its proper direction by the rows of stationary plates, passing from these vanes to the movable blades, by acting, first upon the smaller set of blades, from which it is expanded into the larger portion of the chamber to act upon the next larger set of blades, and so on, throughout the series. By this device, which increases the diameter of the rotating parts, the speed of the shaft is reduced and the necessity of back gearing is avoided.

Naturally the chief object of competition among engine builders during the past half century has been to reduce the cost of manufacture. In many instances this result has been attained by simplifying the methods of construction. Thus, one of the most important changes that has been made in recent times is the system adopted so generally by builders of merchantable engines in reducing the number of main parts to a single column or bed-plate, the revolving and reciprocating parts being supported, and the cylinder secured directly to this bed. To-day engines of this type—both horizontal and vertical—are made in all parts of this country. In fact, to fully comprehend the

LOCOMOTIVES

efficiency of the modern steam engine it is necessary to remember that prior to 1850 it required from five to eight pounds of coal, and fully as much as 80 pounds of water per horse-power per hour to operate the most economical engine that had then been placed upon the market. To-day, however, the same results may be obtained by an expenditure of but 1.8 pounds of coal and 15 pounds of water per horse power per hour.

Interesting as it would be to examine an array of statistics that would show the amount of capital involved, the number of men employed and the value of the annual production of all the branches of the engine-building industry, the manufacture of engines is so widely distributed among so many shops of such various kinds that it is impossible, either by reference to the census reports or by any other means, to give any figures that could be accepted as reliable. To-day there is scarcely a town of any importance in which there are not one or more shops where engines of one kind or another are built and it seems to be utterly impossible for statisticians to get such a diversified industry under anything like a comprehensive classification.

For example there are several important branches of the industry of engine building that have not even been mentioned, for the manufacturer of gas engines, which are now working in units of upward of 700 horse-power; the makers of steam road-rollers, and of motor vehicles, to say nothing of the manufacturers of steam fire-engines, all deserve to be included in the list of engine builders. It was in 1842 that Capt. John Ericsson built the first steam fire-engine. It was tested in the city of New York, but was not adopted for general use as the time required to raise the steam was then fully 18 minutes. In 1853, however, by which date the time in which steam could be raised had been reduced to less than four minutes, an engine of this character was adopted by the fire department of Cincinnati, and, from that day, the improvement in their mechanism has continued, and their use has become so general that even small villages are now protected by such machines.

No review of the engine-building industry would be complete without some reference to the use of electric power as a means of propulsion. Regarded as little more than an impracticable project a trifle more than 30 years ago, the substitution of electricity for other motive powers has now become so general that it is impossible for any one to predict just how far the movement will go. Already the tramway lines in every part of the world have adopted electricity. It has taken the place of steam in the operation of elevated railroads and subway systems, and has already encroached so far upon the provinces formerly sacred to the steam engine—being used for switching purposes, in the suburban railway service, and for many quick short runs—that nobody would be surprised at the announcement that some one of the great railway systems had determined to adopt such power for more general work. The progress of the electrical science has been so rapid that what was a novel invention yesterday is obsolete to-day, and it is impossible to imagine how much further its development will proceed.

As a matter of fact, however, these words apply almost as well to the progress of steam-engineering as they do to that of electricity. While the development in the use of steam has been so great that it has practically revolutionized our methods of living, there is no reason to believe that its progress is approaching its termination. Already the use of engines that have been made for torpedo boats and submarine craft, as well as the experiments of Maxim and Langley, and the introduction of steam engines and boilers of power hitherto inconceivable in view of their lightness, all tend to indicate that the art of steam-engineering is destined to still further development.

ALBA B. JOHNSON,
Baldwin Locomotive Works.

Locomotives, Compound. The compound locomotive, like the compound stationary engine, is designed to save fuel by requiring less steam to do a given amount of work. A compound locomotive is not necessarily any more powerful, nor any faster, than a simple engine, but will do the same work with less coal and for less money. A compound locomotive, however, may be both faster and more powerful than a simple engine for the reason that as the compound uses less steam (q.v.) doing the same work, the same boiler that supplies a simple engine will do more work with compound cylinders.

The principle of compounding steam cylinders is to let the exhaust from the high pressure cylinder go to the low pressure and drive that before escaping to the atmosphere. This is done to divide the expansion between the two cylinders instead of doing it in one, the aim being to avoid excessive condensation. Steam at 200 pounds gauge pressure per square inch is at a temperature of 387 degrees, while the back pressure or pressure of the steam that is being pushed out of the cylinder by the returning piston will average about 5 pounds or 227 degrees. The steam then would expand from 200 down to 5 pounds or a difference of 160 degrees of heat. The cylinder cools down with the steam (though not so rapidly) and, presenting a comparatively cool surface to the next admission of steam, condenses a portion of it. The heat from the condensed steam goes to warm the walls of the cylinder which are again cooled by the expansion.

The ideal compound locomotive seems to be one that can be used either simple or compound at any time or for any length of time at the will of the engineer. When used in either condition it should be of equal power on each side, and when running simple should be as economical as any simple engine under the same conditions. It should of course only be used simple in starting or in getting a train over a bad part of the road. The engine should not be worked simple any more than necessary, as in the compound position it is saving the fuel. Nor should an engine working compound be hooked up to cut off as short as in working simple.

The first compound locomotive of which we have record is that of Thomas Craddock who began experimenting in April 1844. In his book, 'The Chemistry of the Steam Engine,' published in London in 1848, he proclaims the superiority of the compounding feature and de-

OPERATION OF LEADING COMPOUND LOCOMOTIVES

3. Pittsburgh Compound — working compound.

4. Richmond Compound — simple.

LOCOMOTIVES

scribes an engine in which "one eccentric, one valve, one crosshead, one connecting rod and one steam box serve both cylinders." He evidently abandoned this, as in the engine shown

Compound Locomotive of Thomas Craddock. 1848.

he used two crossheads and two connecting rods, although he used but one valve. He also used a fan condenser as will be seen, and claimed a vacuum of 24 inches. The cylinders of this engine were 6 and 14 inches respectively, or a ratio of 1 to 5.4. Another plan of his was also shown, but there is no record of its having been built. He used 115 pounds of steam, but predicted the use of 200 pounds in the nearer future than it was realized. His patent was dated 3 Dec. 1846. Other early inventors were: John Nicholson, James Samuels and Frazer Selby, all English.

The first American compound locomotive was built at the Shepard Iron Works, in Buffalo, from the designs of Perry & Lay in 1867. A switching engine of the Erie Railroad had their tandem cylinders placed on it. This engine worked nicely and ran for several years, but coal economy was still a question of the future, and as it was ahead of its time, the idea was abandoned. The next compound was of the two-cylinder type and was built in 1870 by the Remington Arms Company, at Ilion, N. Y., from the design of William Baxter. This was used on a suburban road, the Worcester and Shrewsbury, and gave good service. It has an intercepting valve under control of the engineer, and could be run as a simple engine any length of time. On 11 March 1873, a patent was granted William S. Hudson, of the Rogers Locomotive Works, Paterson, N. J., for a superheater in smoke-box, so arranged as to reheat the steam passing from high pressure to low pressure cylinders of a two-cylinder compound. This is sometimes cited as the first two-cylinder compound, but in reality none were built, and it was preceded by others as we have seen. About this time the compound began to excite more interest both in England and on the Continent. Prominent among them were Anatole M. Mallet, Francis William Webb, August Von Borries and Robert Lindner.

This brings us to the later American designs, with which we are most interested. On 25 June 1889 a patent was granted to Samuel M. Vauclain, of Philadelphia, for a four-cylinder type of engine. Cylinders were parallel and connected to one crosshead. One patent shows two piston valves, another shows but one, which is the style now used and known as either the "Vauclain" or "Baldwin" type. It is rather a curious matter of patent history that on 18 June 1889, one week earlier, Joseph Lewis, of South Evanston, Ill., obtained a patent for a similar engine, except that the one piston valve was rotated by gearing instead of being a reciprocating valve. This engine has never been in service, however.

On 10 Dec. 1889 Albert J. Pitkin obtained his patent on what is now known as the Schenectady compound. As first built it went into compound automatically and could not be run as a simple engine except at the start, but this has been modified so as to make it optional with the engineer. On 27 May 1890 Henry F. Colvin, of Philadelphia, obtained a patent on the application of an automatic reducing valve to admit live steam to low pressure cylinder just in proportion to ratio of cylinders, so as to keep the total power on each side equal. This engine was built by the Pittsburg Locomotive Works. The Pittsburg compound has the intercepting valve on the high pressure side and it is not moved to compound automatically, but is moved independent of pressure in the receiver. It can be run simple any length of time (as is now common with them all), but this and the Rhode Island were the first to have this feature, except the Baxter before mentioned. In starting, the high pressure cylinder receives steam as usual, and the steam for the low goes through the reducing valve into the receiver, a separate passage being provided for the high pressure. Moving the valve into compound position shuts the live steam from the receiver and closes the independent exhaust of the high pressure cylinder and turns it into the receiver to the low.

The late C. H. Batchellor patented what is known as the Rhode Island compound on 22 Sept. 1891. This was similar to the Pittsburg engine in some ways, but had the intercepting valve on the low pressure side and goes into the compound automatically by an accumulation of reserve pressure. The Richmond compound (Mellin System) has the intercepting valve on the low pressure side, and is moved automatically by the receiver pressure.

The Richmond engine was the first to use an overpass valve. With an engine running without steam or "drifting" as railroad men call it, the cylinders become air-pumps. The air forced out drafts the fire at a time when it is not needed, and on mountainous roads cuts quite a figure in coal consumption. While this is present in any engine, it is aggravated in the large cylinder of a compound, and is usually met by the use of a vacuum valve at each end of the cylinder. These admit air and do not overcome the needless draft on fire. It is often charged that two-cylinder compounds "nose" around on account of developing more power on one side than the other, but this would seem to be largely imagination. A simple engine is always working one-sided in so far as one side is at maximum while the other is a minimum power, and it is nothing out of the usual to bring an engine in with one side uncoupled, the other doing all the work. The fallacy of one-sided working when running simple on account of large cylinders is shown by the action of reducing valve and the fact that careful tests show a variation of less than 2 per cent with careful designing. This is no more than is apt to be found on any engine after having its cylinders bored larger than the other—being simply trued up. The fact that a compound engine has more power when working simple than in compound is generally taken as showing that the reducing valve does not act quickly and the large cylinder gets more than its proportion of steam. That this is not the case we learn that the safety valve in the receiver passage—set to

LOCOMOTOR ATAXIA—LOCUST TREES

blow at the determined receiver pressure—rarely or never pops. The actual reason is that the high pressure cylinder is relieved by its back pressure, which adds quite a little to the effective forward pressure.

The last few years has brought the tandem compound to the front after the lines of Perry and Lay in 1867. These are the Schenectady, the Colvin-Wightman and the Baldwin. They are very heavy and powerful engines and are capable of heavy work. They are necessarily heavy in front and some of them are very inconvenient to get at and repair. This, however, is more the fault of the designer than the type. The balanced engine, too, is coming to the front, with one set of cylinders driving the wheels from the outside and the other by cranked axles on the inside. They are a development of the old Shaw and Strong locomotives. In France this is known as the DeGlehn type.

The points to be considered by the mechanical engineer, as in any case, are the construction from a mechanical point of view, the number of parts, their strength or delicacy, and the likelihood of failure. Also the number of ground joints, if any, and the result if they are not kept tight. As it is a simple case of dollars and cents, the additional first cost and cost of repairs as compared with a simple engine must be weighed against the fuel economy. If the net results were not satisfactory, the compound would not be increasing in use as rapidly as it is at present. That the compound locomotive has come to stay and is doing good work there is no doubt, in spite of the opposition in some quarters, and a fuel saving of from 10 to 30 per cent is being obtained in nearly every instance. Neither is the cost of repairs necessarily high. For a more detailed history of the compound locomotive, consult the Reports of the Franklin Institute on the subject.

FRED H. COLVIN, M. E.,

Author of 'American Compound Locomotives.'

Locomotor Ataxia, a disease of the nervous system, usually occurring in adults from 40 to 50, and characterized by pain, inability to walk, and by progressive weakness which leads finally to death. The malady is long drawn out, and while not entailing, as a rule, a great amount of physical pain, causes extreme inconvenience to the patient. In the vast majority of patients it first shows itself by neuralgic pains of the lower extremities. Thus, there may be acute darting and lightning-like pains, lasting from half an hour to an hour or two, about the ankles, in the instep, shooting up the leg, or in the thighs. Occasionally these pains are present in the arms and trunk. They are frequently diagnosed as neuralgia, and it is not until development of the symptoms of ataxia (q.v.)—inability to walk in the dark, and to place the foot or hand where the mind wishes it to be placed—that the true nature of the constant neuralgic pains is recognized. With the gradual development of the inability to walk there may be a number of other symptoms—acute, lightning-like pains in the stomach, intense, sometimes acute, pain in the bladder, sometimes loss of voice, etc. There may be patches of anæsthesia over the body and there is usually progressive muscular weakness. Loss of kneejerks is an important early sign.

Associated with ataxia of the legs, which prevents the patient from walking readily in

the dark, or up and down stairs, there may be some ataxia in the hands, whereby the finer movements of buttoning the clothing, of writing, etc., may be interfered with. A very constant and usually a very early sign of locomotor ataxia consists in certain changes in the reactions of the pupil of the eye to light. This symptom is technically known as the Argyll-Robertson pupil, and shows a fixed pupil when exposed to the influence of light, but a pupil that dilates or contracts normally when tested for its powers of accommodation. Thus the pupils of a patient who has this symptom contract on looking at a near object and dilate on looking at a far object; but if a candle or beam of light is thrown suddenly on the eye, normal quick contraction of the pupil is diminished or absent. The Argyll-Robertson pupil is sometimes found as early as the neuralgias, and a diagnosis may often be made on that alone.

The progress of the disease is usually very slow; remissions occur, which give great hope to the patient and afford ample opportunities for all forms of charlatanism; but the final outcome is usually hopeless. Many conditions of the spinal cord are known in which some of the symptoms of locomotor ataxia are present, chronic neuritis from alcoholism being one. As many of these are recoverable, the diagnosis of locomotor ataxia is an extremely difficult one, and can be made only by the competent specialist. Consult: Starr, 'Organic Nervous Diseases' (1903); Marie, 'Maladies de la Moelle.'

Lo'cris, the parts of ancient Greece inhabited and named after the Locrians, the oldest Grecian peoples. There were four branches—the Epicnemidian, the Opuntian, Ozolian, and Epizephyrian Locrians, the last a colony from the Ozolian stock, living in Lower Italy. Their capital, Locri, was one of the most powerful, splendid, and wealthy cities of Magna Græcia.

Lo'cus, in mathematics, when the conditions of a problem are not sufficient to determine the absolute position of a point, but restrict it to a certain line (or lines), this line is called the locus of the point. Thus, if the base and area of a triangle are given, the locus of the vertex is a straight line parallel to the base; or if the distance of a point from another point is in a given ratio to its distance from a given fixed line, the locus of the point is a conic section.

Lo'cust. See GRASSHOPPERS; CICADA.

Locust Trees, a genus (*Robinia*) of leguminous trees and shrubs. The species have odd-pinnate leaves; pea-like flowers in drooping racemes; and pods containing several bean-like seeds. They are all useful for ornamental planting, and one species, *R. pseudacacia*, is highly valued for its timber. This species, which is the best known, and is also called false acacia and black locust, is the largest of its genus, attaining heights exceeding 75 feet and girths greater than eight feet in the rich alluvial soils of Tennessee and Kentucky. Its hard, tough, close-grained yellow wood is especially useful for ship-building, fence-posts, and other purposes in which great durability is required. It is also employed for making cog-wheels, tree-nails, for the interior finish of houses, for furniture and other uses where a highly polished wood is needed. It is the favorite material for policemen's clubs, not only because of its weight and toughness, when

well seasoned, but because of its unusual resonance, giving a ringing report when struck upon the pavement as a signal which can be obtained from no other wood. In various parts of Europe great attention has been paid to the propagation of this tree, for ornament as well as for its useful properties, and its cultivation is further encouraged by the absence of the destroying insect above mentioned. It forms a pleasing object along the borders of many of the railways on the Continent, its spines adding to its usefulness as a hedge. When in bloom, the large pendulous racemes of fragrant white flowers, contrasting with the light-green foliage, produce a fine effect, and give this tree a rank among the most ornamental. The leaves are pinnate, and the leaflets very thin and smooth. The flowers, resembling in form those of the pea, diffuse a delicious perfume, and are succeeded by a flat pod.

The chief objection to the tree is its liability to the attacks of insects, more than 40 species being known to feed upon its leaves and wood. The foliage destroyers, which include leaf-rollers, leaf-miners, and several species that feed in exposed positions, are sometimes seriously destructive, the larvæ of one species, a saw-fly (*Nematus similaris*), sometimes destroying all the green parts. But they are less destructive than the borers which tunnel through and weaken the wood. Sometimes they are so numerous that the trees become mere shells of bark with a honeycomb of wood. The more important of these are the locust borer (*Cyllene robinia*), a black and yellow striped, long horned beetle in the adult stage, which is common in the eastern United States; and the larvæ of a moth (*Scipteron robinia*), troublesome in the Pacific Coast region. These and some others have discouraged the commercial planting of this valuable tree.

Another American "locust" tree is found in the two species of the genus *Gleditsia* of the senna family, which includes the Kentucky coffee tree. These are the water or swamp locust (*G. aquatica*) of Florida, which has enormous spines and reddish flat oval pods; and the well-known and widely planted honey locust or honey shucks (*G. triacanthos*). This large graceful but exceedingly thorny tree bears especially fragrant flowers, and its pods are gathered by country people in the South and eaten for the sake of the sweet pulp between the seeds. Its great pods measure 10 to 20 inches long; are curved, and "in drying twist and retwist while they open, and skillfully scatter seeds in diverse directions."

Lod'don, Australia, one of the most important rivers of Victoria; rising on the northern slopes of the Dividing Range, in Talbot County, flowing northwest for 250 miles, and joining the Murray at Swan Hill. It drains a basin of 4,800 miles and is subject to floods. Good cod and bread abound in it.

Lode, a metalliferous deposit, usually having the character of an ore-producing vein—confined within walls and having something of regularity. The name is sometimes applied to any regular course or vein, metallic or otherwise.

Lodemán, ló'dé-man, **Ernest Gustavus**, American horticulturist: b. Neuchâtel, Switzerland, 1867; d. 1896. He was graduated from the Michigan Agricultural College in 1889, in

1890 was appointed assistant to Professor Liberty H. Bailey of Cornell, and somewhat later an instructor in the university. He was the originator of the "spray-calendar," a tabulated form furnishing the dates for spraying the fungi and insect pests of given crops and receipts for the preparation of suitable compounds for such use. His only publication is 'The Spraying of Plants' (1896), a valuable manual.

Lode'star, **Loadstar**, **Polaris**, or **Guiding Star**, various names given to the polar star which is the last star in the tail of the Little Bear. It is a star of the second magnitude, located 1° 20' from the North Pole.

Lodge, **George Cabot**, American poet: b. Boston 10 Oct. 1873. He is a son of H. C. Lodge (q.v.) and was graduated from Harvard in 1895. During the Spanish-American War he served in the American navy as ensign. He has published 'Song of the Wave' (1898); 'Poems' (1902).

Lodge, **Gonzales**, American classical scholar: b. Fort Littleton, Pa., 19 Dec. 1863. He was graduated from Johns Hopkins University in 1883, was professor of Greek in Davidson College, N. C., 1886-8, and at Bryn Mawr College, 1889-1900. Since 1900 he has been professor of Greek and Latin at the Teachers' College of Columbia. He has published 'Lexicon Plautinum' (1901), and with Gildersleeve, 'Gildersleeve-Lodge Latin Grammar and Latin Composition.' He has edited 'The Gorgias of Plato' (1890), and the 'Gildersleeve-Lodge Latin Series.'

Lodge, **Henry Cabot**, American politician and author: b. Boston 12 May 1850. He was graduated from Harvard in 1871 and from the law school in 1875, being admitted to the bar in 1876. In 1873-6 he was editor of the 'North American Review'; was then lecturer on history at Harvard till 1879, when he became editor of the 'International Review' till 1881. Becoming active in political life he served two terms in the Massachusetts legislature; was elected to Congress in 1886, and served till 1893, when he was elected to the Senate; and was re-elected in 1899. He was also delegate-at-large to the Republican National Conventions in 1884 and 1896, and permanent chairman of the 1900 convention. He has strongly advocated protection, and the restriction of immigration and the protection of the franchise by educational qualifications; he was a strong supporter of the policy of the administration during the Spanish War, and in regard to the Philippines, and was made chairman of the Senate committee on the Philippines, and a member of the committee on foreign relations. He has published 'Life and Letters of George Cabot' (1877); 'Short History of the English Colonies in America' (1881); 'Alexander Hamilton' (1882); 'Daniel Webster' (1883), and 'George Washington' (1889), in the 'American Statesmen' series; 'Studies in History' (1884); 'Boston' (1891, in the 'Historic Towns' series); 'Hero Tales from American History' (with Theodore Roosevelt, 1895); 'Certain Accepted Heroes' (1897); 'Story of the American Revolution' (1898); 'The War with Spain' (1899); and a volume of 'Speeches'; he has also edited the works of Alexander Hamilton (1885).

Lodge, Sir Oliver Joseph, English physicist: b. near Stoke-upon Trent, Staffordshire, 12 June 1851. He was educated at University College, London, and was demonstrator of physics there in 1875, and in 1877 professor. He was professor of physics in University College, Liverpool, 1881-1900, and since the date last named has been principal of the University of Birmingham. He has published 'Elementary Mechanics' (1877); 'Modern Views of Electricity' (1889); 'Pioneers of Science'; 'Signalling Without Wires'; 'Lightning Conductors and Lightning Guards.'

Lodge, Thomas, English dramatist and poet: b. West Ham, near London, England, about 1556; d. London September 1625. He entered at Lincoln's Inn, but seems to have led a wild and rollicking life, and in 1589-91 varied his life by taking part in two sea expeditions against the Spaniards, in the neighborhood of the Azores and Canary Islands. On the earlier of these he wrote the famous pastoral 'Rosalynde: Euphyes's Golden Legacie' (1590), which supplied Shakespeare with the basis of 'As You Like It.' Lodge himself wrote two dramas, 'The Wounds of Civil War' (1594; reprinted in Hazlitt's Dodsley's 'Select Collection of Old Plays,' Vol. VII.), and 'A Looking-glass for London and England' (1594), in collaboration with Robert Greene. Consult Jusserand, 'The English Novel in the Time of Shakespeare' (1890).

Lodi, lō'dē, Italy, a town in the province of Milan, Lombardy, on the Adda, 18 miles southeast of Milan. The principal buildings are the duomo or cathedral, a Gothic structure of the 12th century; the octagonal church of the Incononata; the town-house; the episcopal palace; the Barni and Merlini palaces. Majolica and delftware, refined wax, saltpeter, and chemical products are manufactured. Stracchino and Parmesan cheese, which, though it takes its name from Parma, from which it was first exported, is almost wholly made in the district around Lodi, utilizing the milk of several thousand cows. The chief incident in Lodi's history is the entry by Napoleon after the famous passage of the Bridge of Lodi effected against the Austrians in 1796. Pop. (1901) 27,811.

Lodomeria, lō-dō-mē'ri-a, Austria-Hungary, a former independent principality in Volhynia, since the division of Poland in 1772 constituting an integral part of Galicia (q.v.).

Lodz, lōdz, Russian Poland, the capital of a district in the government of Piotrkow, 76 miles southwest of Warsaw, and an important manufacturing centre, the terminus of a branch line from the Warsaw & Vienna Railway. It has made considerable modern progress owing to the flourishing condition of its cotton, woolen, and other manufactures. Silk goods are also manufactured, and there are dyeworks, breweries, machine-works, etc. The Roman Catholic Poles number about 40 per cent, German Protestants 33 per cent, and Jews 27 per cent of the population, which from 50,000 in 1872 had increased in 1897 to 315,209.

Loeb, Iéb, Jacques, German-American physiological chemist and biologist: b. Germany 7 April 1859. He studied at Berlin, Munich, and Strasburg, was assistant at both Würzburg (1886-8) and Strasburg (1888-90),

studied at the Naples zoological station, and in 1891-2 was associate professor of biology at Bryn Mawr College. In 1892 he became assistant professor of physiology and experimental biology at the University of Chicago, and in 1895 associate professor. He was also professor of physiology at the Rush Medical College of Chicago from 1900. In 1902 he was appointed professor of physiology in the University of California. His chief work has been in physiological chemistry. He is the first to make researches in regard to tropic and chemical reactions in animal life. His experiments have shown that many activities of the animal world previously ascribed to ganglia and brain-centres are really due to such reactions. Thus he found that a certain chemical solution effects the contraction of muscular tissue known as "heart-beats," as tested on detached heart-tissue and hearts of certain animals and by introduction of the solution into human blood-vessels. He also made experiments in artificial parthenogenesis. He has published numerous essays, largely in the 'American Journal of Physiology,' and a volume 'Comparative Physiology of the Brain and Comparative Psychology' (1900).

Loeb, Louis, American artist: b. Cleveland, Ohio, 1860. He completed his studies in art under Gérôme in Paris, winning honorable mention at the Salon in 1895, and a 3d medal in 1897. As artist, illustrator, and teacher he has secured a notable place. His studio is in New York. As an illustrator of books and magazines he has shown both strength and inventive ability. In 1903 his exhibition of oils at the new rooms of the Co-operative Society in New York aroused interest in his later work, which shows a steady progress in his artistic achievements.

Loess, lès or lō'es, a loamy deposit of Pleistocene age, abundantly developed in the valleys of the Rhine, the Danube, the Rhone, and many of their tributaries. It is a pulverulent yellowish-gray or brownish loam, homogeneous and non-plastic, and consists principally of clay with small angular grains of quartz, and extremely minute scales of mica, together with a larger or smaller admixture of carbonate of lime and some iron oxide. It has a tendency to cleave in vertical planes, and thus forms cliffs where streams intersect it. The organic remains of the loess consist principally of land-shells of existing species, but now and again fresh-water shells are met with. Occasionally, also, the remains of man and the Pleistocene mammals are encountered. The deposit varies from a small thickness up to nearly 300 feet, and occurs at greatly differing levels, so that more than one agency would seem to have been active in its formation. Escaping flood-waters from glaciers are believed to have made much of the deposit; some of it may have been the result of weathering and rain-washings. The European loess is undoubtedly associated with the glacial deposits of the Continent, and in North America, where it is strongly developed, being very thick, as it is in parts of China (q.v.), the same relationship obtains. The geologists of the United States Geological Survey maintain that the accumulations which cover enormous areas in the great basin traversed by the Mississippi and its affluents are essentially fluvialite. Richthofen believes the Chinese accumulation to have been of æolian origin, and this theory of wind-blown

material has also been advanced with respect to deposits in the United States; but the general opinion of geologists favors the theory of aqueous origin for the whole formation. Consult: Sixth Annual Report of the United States Geological Survey (1888); Chamberlin and Salisbury, 'The Driftless Area of the Upper Mississippi Valley'; McGee, 'The Pleistocene History of Northeastern Iowa,' in the United States Geological Survey, Eleventh Annual Report (1891); Geikie, 'Prehistoric Europe' (1881).

Loewe, Wilhelm (also called **LOEWE-KALBE**), German politician: b. Olvenstedt, near Magdeburg 1814; d. 1886. He was educated at Halle, and adopted the medical profession. Elected in 1848 to the Frankfort Parliament, he acted with the extreme party of democracy; became first vice-president of the Parliament; and later, at Stuttgart, was its president. Charged with sedition in this, which was considered a revolutionary procedure, and once acquitted, he was nevertheless sentenced to life imprisonment for contumacy. After some years in Switzerland, France, and England, he came to this country, and for eight years practised medicine in New York. Availing himself of the amnesty in 1861, he returned to Germany, and in 1863 was elected to the Prussian House of Deputies. Four years later he was a Progressist member of the North German Reichstag. Disagreeing with his party in 1874, on the military law, he attempted to form a new Liberal party. In the elections of 1881 he lost his seat.

Loewenthal, lé-vén-täl, Henry, American journalist: b. New York 15 May 1853. Trained in the public schools and the College of New York, he studied law at the Columbia College Law School, taking his degree in 1875. He began newspaper work on the New York *Tribune* as reporter in 1872. In 1875 he was appointed law reporter on the New York *Times* and acting city editor in 1878. In 1879 to 1893 he was city editor, and from 1873 to 1896 had charge of real estate matters. In August 1896 he became managing editor, a position he now (1903) holds.

Loewy, lé-vé', Maurice, French astronomer: b. Vienna 1833. He studied astronomy and was given a position in the observatory at Paris by Leverrier, and after the latter's death assisted Mouchez in the observatory of Montsouris. He is noted for his invention of the *Equatorial-coude*, or Elbow-equatorial, in which the observer remains seated at the upper end of the polar axis of the telescope, as if working with a microscope on a table, with the means of directing his view to any part of the heavens under his control. He also devised improved methods of determining the constants of astronomical refraction and aberration.

Lofoten, lö-fö'ten, or Lofodden, Norway, a group of islands off the northwest coast, stretching southwest to northeast about 175 miles. The largest are Andøen, Langoen, Hindøen, East and West Vaagen, and Flagstadøe. They have bold, precipitous, rugged, and deeply indented coasts, and an elevated, sterile interior, several containing mountains which, though not lofty, are covered with perpetual snow. Immense shoals of cod and herring frequent their shores, and extensive and valuable fisheries are

carried on. The principal cod-fishery beginning January-February, ends in April, but the herring-fishery continues, and furnishes an important branch of national revenue. In ordinary years about 4,000 boats, each manned by five hands, are employed. The celebrated whirlpool, the Maelstrom, is situated at the southern extremity of these islands. Permanent population of group, about 20,000.

Lof'tie, William John, Irish Anglican clergyman, writer on antiquities: b. Tandragee, County Armagh, 25 July 1839. He was educated at Trinity College, Dublin, and after holding temporary Church appointments, became assistant minister of the Chapel Royal, Savoy, in 1871. He joined the staff of the 'Saturday Review,' and in 1894 that of the 'National Observer.' As a writer on antiquarian subjects he successfully combines learning and picturesque statement. He has published, 'Round About London' (1877; 4th ed. 1880); 'Plea for Art in the House' (1877); 'Memorials of the Savoy' (1879); 'A Ride in Egypt' (1879); 'A History of London' (1883); 'Authorized Guide to the Tower of London' (1886); 'London' (1887); 'Windsor' (1887); 'Westminster Abbey' (1890); 'The Cathedral Churches of England' (1892); 'Inigo Jones and Wren' (1893); 'Inns of Court and Chancery' (1894); 'London Afternoons' (1901); etc.

Lof'tus, Augustus William Frederick Spencer, English diplomatist: b. 4 Oct. 1817; d. 9 March 1904. He entered the diplomatic service in 1837 as attaché at Berlin and was likewise attaché at Stuttgart in 1844. He was secretary to Stratford Canning in 1848, and after serving as secretary of legation at Stuttgart (1852), and Berlin (1853), was envoy at Vienna (1858), Berlin (1860) and Munich (1862); became ambassador at Berlin 1865, to the North German Confederation 1868-71, and to Saint Petersburg 1871-9. He was governor of New South Wales 1879-85. He published 'The Diplomatic Reminiscences of Lord Augustus Loftus' (1892-4).

Log, an apparatus used to measure the rate of a ship's velocity through the water. For this purpose there are several inventions, but the one most generally used is the following, called the common log. It is a piece of thin board, forming the quadrant of a circle of about 6 inches radius, and balanced by a small plate of lead, nailed on the circular part, so as to swim perpendicularly in the water, with the greater part immersed. The log-line is fastened to the log by means of two legs, one of which is knotted, through a hole at one corner, while the other is attached to a pin fixed in a hole at the other corner, so as to draw out when sufficient force is exerted on it. The log-line, being divided by means of knots of colored cloth into certain lengths, which are in proportion to an equal number of geographical miles, as a half or quarter minute is to an hour of time, is wound about a reel. The whole is employed to measure the ship's head-way in the following manner:—The reel being held by one man, and the half-minute glass by another, the mate of the watch fixes the pin and throws the log over the stern, which, swimming perpendicularly, feels an immediate resistance, and is considered as fixed, the line being slackened over the stern

to prevent the pin coming out. The knots are measured from a mark on the line at the distance of 12 or 15 fathoms from the log. The part of the line between the log and this mark is called the stray-line. The glass is turned at the instant that the mark passes over the stern, and as soon as the sand in the glass is run out the line is stopped. The water then pressing on the log dislodges the pin, so that the board, now presenting only its edge to the water, is easily drawn aboard. The number of knots and fathoms which had run off at the expiration of the glass determines the ship's velocity.

Log-book, a book in which are officially recorded the proceedings on board a ship. In it the contents of the log-board are daily transcribed at noon, together with every circumstance deserving notice that may happen to the ship or within her cognizance, either at sea or in a harbor, etc. In addition to the weather, speed, astronomical observations, etc., the entries required to be made include convictions, offenses, punishments, conduct of crew, illnesses and injuries, deaths, births, and marriages, quitting the ship, wages of men entering the navy, wages of deceased seamen, sale of deceased seamen's effects, collisions—in short, every condition, occurrence, and transaction which comes under official notice. The log-book must be signed by master and mate, and certain other persons in particular cases.

Log Cabin and Hard Cider, a term used in American politics in the campaign of 1840. The Whig candidate for President, William Henry Harrison, was a military man of plain manners. One of the Democratic papers, scoffing at the Whigs for taking a candidate not of the first caliber, advised that Harrison be given a log cabin and a barrel of hard cider, and he would stay contentedly in Ohio. This was taken up by the Whigs, and really helped to make their candidate popular with the masses. Log cabins were erected in great numbers in the cities, and were carried in processions, accompanied with barrels of cider.

Log-rolling, in American politics, a term used for maneuvers of politicians, by which they seek to secure co-operation in carrying favorite measures through legislatures and other bodies. Generally log-rolling is employed by individuals who approach others in support of personal schemes and interests. The word was formerly very popular in the United States, but has become almost obsolete, being supplanted by the term "button-holing."

Logaëdic (lŏg-ə-ē'dīk) **Verse**, in Greek and Latin poetry, a rhythm in $\frac{3}{4}$ time; now obsolete and are rarely found except in imitations of classic lyric measures. See **METRE**; **RHYME**.

Logan, lŏ'gan, English name of the American Indian chief Tah-gah-jute: b. about 1725; d. 1780. He was the son of Shikellamy, a celebrated chief of the Cayugas, who lived at Shamokin on the Susquehanna, and was called Logan from James Logan, the secretary of Pennsylvania and a firm friend of the Indians. In his early manhood he was known throughout the frontier of Virginia and Pennsylvania for his fine personal appearance, engaging qualities, and his friendship for the whites. About 1770 he removed with his family to the banks of the Ohio, where he gave way in a measure to in-

temperance. In the spring of 1774 his family were massacred, it was alleged, by a party of whites led by Captain Cresap, under the pretext of retaliation for Indian murders; but it is exceedingly doubtful whether Cresap had any connection with the transaction. Logan at once instigated a war against the scattered settlers of the far West, and for several months fearful barbarities were perpetrated upon men, women, and children. He disdained to appear among the chiefs who subsequently sued for peace, but sent by an interpreter to Lord Dunmore, the governor of Virginia, the noted speech explaining his conduct, which was first published in Jefferson's 'Notes on Virginia.' Its authenticity is open to much doubt, however. While intoxicated he attacked a party of friendly Indians and was killed by his relative Tod-hah-dohs in self-defense.

Logan, Benjamin, American pioneer: b. Augusta County, Va., about 1752; d. Shelby County, Ky., 11 Dec. 1802. He early crossed the Alleghanies and became a settler in Kentucky. He was an associate of Simon Kenton and Daniel Boone in the Indian fighting then constantly in progress on the frontier. During the Revolutionary War he was also active in the contests between the colonial frontiersmen and the British and their Indian allies. In 1776 he built one mile east of Stanford, Ky., on the site now called St. Asaph's Spring, the stockade known as "Logan's fort." When this fort had for weeks in 1777 been besieged by Indians, Logan made his way through the enemy's lines and traveled 150 miles to Holston where he obtained supplies and reinforcements. He participated as second in command in Colonel John Bowman's expedition against the Shawnees at Chillicothe, and led the force sent against the Indians under Simon Girty. His advance guard, through over-haste, was defeated at Blue Licks, and Logan himself did not reach the scene of battle until the succeeding day. In 1788 he commanded a force of 600 against the northwestern Indians. He was for many years a member of the Kentucky legislature; and sat also in the State constitutional conventions of 1792 and 1799. His prowess was celebrated on the frontier.

Logan, Celia. See **CONNELLY, CELIA LOGAN**.

Logan, Cornelius Ambrosius, American dramatist: b. Baltimore, Md., 1806; d. near Wheeling, W. Va., 1853. After a varied career as actor and manager he became a theatrical manager in Cincinnati in 1840. He made a vigorous reply to Lyman Beecher's attack upon the stage from the pulpit; and wrote several successful plays, such as: 'Yankee Land' (1834); 'The Way of Maine'; 'A Hundred Years Hence'; a burlesque; 'The Wood Dealer.' He also wrote tales and poems.

Logan, George, American statesman and philanthropist; grandson of James Logan (q.v.), b. Stenton, near Philadelphia, 9 Sept. 1753; d. there, 9 April 1821. He was educated in England, subsequently studied medicine in Edinburgh, where he took the degree of M.D., and afterward returned in 1779 to America. For many years he devoted himself to agricultural pursuits, which he was one of the first in America to prosecute successfully in a scientific manner. He also served several terms in the Pennsylvania legislature. At the outbreak

of the French Revolution he embraced with enthusiasm its democratic doctrines, and joined Jefferson and the republican party in opposition to the federalists. In 1798, the United States being then on the brink of a rupture with the French republic, he departed for France, under the idea that he might contribute to the preservation of peace. He was well received by Talleyrand and Merlin, then chief of the Directory, and returned to America with the assurance of the desire of the French government to renew amicable relations with the United States. But as he had taken with him letters of introduction from Jefferson instead of passports from the state department, he was denounced by the Federalists on his return as the treasonable envoy of a faction who had undertaken to institute a correspondence with a foreign and hostile power. He was coldly received by Washington and President Adams, and in the latter part of 1798 an act, known as the "Logan act," was passed by congress, making it a high misdemeanor for a private citizen to interfere in a controversy between the United States and a foreign country as he had done. He was subsequently elected to the United States senate, of which body he remained a member 1801-7; and in 1810, urged by the same philanthropic motives which had induced him to visit France 12 years before, he went to England in the hope of preserving peace. In 1797 he published 'Experiments on Gypsum' and 'Rotation of Crops.'

Logan, James, American colonial statesman and author: b. Lurgan, Ireland, 20 Oct. 1674; d. Stenton, near Philadelphia, Pa., 31 Oct. 1751. By his own efforts he acquired a knowledge of the chief ancient and modern languages, and in 1699, being then established in trade in Bristol, England, accepted an invitation from William Penn to accompany him to America in the capacity of secretary. In 1701, upon the return of Penn to England, he was appointed provincial secretary, and subsequently filled the offices of commissioner of property, chief justice, and president of the council, discharging in the last capacity the duties of governor of the province for two years after the demise of Governor Gordon in 1736. The latter years of his life were passed at his country-seat called Stenton, in the pursuit of literature and science. His chief work, 'Experimenta et Meletemata de Plantarum Generatione' (Leyden, 1739; London, translated from the Latin by Fothergill, 1747), an expansion of a paper on the growth of maize published in the 'Philosophical Transactions' for 1735, was considered an important contribution to the science of botany. He was the author of two other Latin treatises of a scientific character published in Holland, of an English translation of Cicero's 'De Senectute,' published in 1744 by Benjamin Franklin, and of Cato's 'Distichs,' the latter in verse; and he left a variety of papers on ethics and philology. The translation of Cicero was the first original one of a classical author printed in America. His library, numbering about 2,000 volumes, was, in conformity with his desire, presented to the city of Philadelphia, and is deposited in a separate department of the Philadelphia library under the name of the Loganian library. He was a member of the Society of Friends.

Logan, John, Scottish poet and Presbyterian clergyman: b. Soutra, Midlothian, Scot-

land, 1748; d. London, 28 Dec. 1788. In 1773 he was licensed as a preacher, and from his eloquence and fervor in the pulpit soon became popular. In 1786, however, owing to intemperate habits and kindred reasons, he was constrained to leave the ministry and going to London there engaged in literary work. His name is now best known in connection with that of Michael Bruce and the controverted authorship of the 'Ode to the Cuckoo.' That Logan is entitled to a place among the minor poets of Scotland is sufficiently attested by his exquisite lyric, 'The Braes of Yarrow.'

Logan, John Alexander, American soldier and politician: b. Jackson County, Ill., 9 Feb. 1826; d. Washington, D. C., 26 Dec. 1886. He studied at Shiloh College, volunteered as a private in the Mexican War, became a lieutenant in the First Illinois infantry, after the war studied law, was graduated from Louisville University in 1851, was admitted to the bar, and was elected to the Illinois legislature in 1852 and 1856. In 1858 he was elected a representative in Congress as a Douglas Democrat, in 1860 was re-elected, but resigned his seat in 1861, and on 13 Sept. was appointed colonel of the 31st Illinois infantry. He led this regiment in the attacks on Fort Henry and Fort Donelson, and was wounded at the latter. On 5 March 1862, he was made a brigadier-general of volunteers, and after commanding the 3d division of McPherson's corps (the 17th) in the northern Mississippi campaign, became major-general on 26 Nov. 1862. He fought at Port Gibson, Raymond, Jackson, and Champion Hill, commanded the centre at Vicksburg, and was appointed military governor of the town upon its capture. In November 1863 he was made commander of the Fifteenth corps, which he led until the fall of Atlanta, save for a short period when in command of the army of the Tennessee. He then returned to take part in the Lincoln presidential campaign, but rejoined his corps, continued with it till Johnston's surrender, 26 April 1865, and afterward for a time commanded the Army of the Tennessee. In 1866-9 he sat in the 40th and 41st congresses as a Republican, and was also re-elected to the 42d, but before taking his seat was chosen by the Illinois legislature to the Senate, where he served from 1871 to 1877. He began legal practice in Chicago, but on 18 March 1879 again entered the Senate. While in Congress he distinguished himself by his eloquence. He was consistently opposed to the restoration of Fitz-John Porter to the army, and in June 1880 made a four-days' speech on the Porter bill. At the Republican national convention in Chicago in June 1884, he was a candidate for nomination to the Presidency, and after Blaine's nomination was nominated Vice-President by acclamation. Shortly after the defeat of this ticket, Logan was again chosen Republican senator from Illinois. Blaine said of him: "While there have been more illustrious military leaders in the United States and more illustrious leaders in legislative halls, there has, I think, been no man in this country who has combined the two careers in so eminent a degree as General Logan." Consult the 'Life' by Dawson (1887).

Logan, Mary Simmerson Cunningham, American editor and journalist: b. Petersburg, Boone County, Mo., 15 Aug. 1838. She was

married to John A. Logan (q.v.) in 1855 and since his death, in 1886, has edited 'The Home Magazine,' has contributed frequently to periodicals and has been editorially associated with the 'American Journal.'

Logan, Olive, American actress, lecturer and author; b. Elmira, N. Y., 16 April 1841. She began her career as an actress in Philadelphia in 1854; retired from the stage in 1868; since then has been a lecturer on social topics. She has published 'Chateau Frissac' (1865); 'Photographs of Paris Life' (1861); 'Women and Theatres'; and 'Before the Footlights and Behind the Scenes: a Book about the Show Business' (1870), besides several plays.

Logan, Stephen Trigg, American jurist; b. in Franklin County, Ky., in 1800; d. in 1880. After studying law and for a while practising in Kentucky he removed (1832) to Springfield, Ill., and there continued in the work of his profession. He became a circuit judge in 1835; was three times (1842, 1844, 1846) elected to the Illinois legislature; and was associated as law partner with Abraham Lincoln, from 1841 to 1844. He was one of those who in 1847 framed the new constitution of Illinois; was again elected to the legislature in 1854; joined the Republican party at its formation, and was a delegate to its national convention in Chicago in 1860.

Logan, Sir William Edmond, Canadian geologist; b. Montreal 20 April 1798; d. Castle Malgwin, Cardiganshire, Wales, 22 June 1875. He was educated chiefly in Edinburgh; was for a time a clerk in London, and afterward became manager of a copper-smelting works in Swansea. While there he devoted himself to the study of geology. In 1840 he went to Canada, and he was the chief of the Geological Survey of that country 1842-70. His writings appeared in the annual reports of the Canadian Survey; in the Proceedings of the British Association, the Geological Society, etc. He published 'Geology of Canada' (1863).

Logan, Ohio, village, county-seat of Hocking County; on the Hocking River, and on the Columbus, Hocking & Toledo railroad; about 45 miles southeast of Columbus. It is situated in the natural gas belt, and in the vicinity of some good farm lands. Nearby is found clay suitable for pottery and bricks. Its chief manufactures are flour, furniture, brick for paving and building, pottery, foundry products, and machinery. The village owns and operates the waterworks. The public library has nearly 3,000 volumes. Pop. (1900) 3,480.

Logan, Utah, city, county-seat of Cache County; on Logan River, and on the Oregon Short Line railroad; about 70 miles north of Salt Lake City. It was settled in 1850 and incorporated in 1866. It is located in an agricultural region with valuable mineral deposits in the vicinity. The chief industrial establishments are knitting-mills, lumber-mills, a brewery, a beet-sugar factory, and flour-mills. Some of the educational institutions are the Brigham Young College, opened in 1878 under the auspices of the Latter Day Saints, New Jersey Academy, under the auspices of Presbyterians, and the State Agriculture College. The waterworks are owned and operated by the city. The

city government is according to the act of 1898, providing for the general government of the cities of the State. Pop. (1900) 5,451.

Logan, Mount, the second highest peak in North America, Mount McKinley (q.v.) being first, in the southwestern part of the district of Yukon in Canada. Its height is 19,500 feet.

Logansport, Ind., city, county-seat of Cass County, locally known as the 'City of Bridges,' 70 miles north by west of Indianapolis, where the Eel River flows into the Wabash. The city is an important railroad centre, being entered by the Chicago, Richmond, Bradford, and Effner divisions of the Pittsburg, C., C. & St. L. R.R.; the Michigan division of the Vandalia, and its 94-mile branch northeast to Butler; and by the Wabash. It is also the western terminal of the interurban line operated by the Fort Wayne & Wabash Valley Traction Company, and the northern terminal of the line operated by the Indiana Union Traction Company.

Industries. The business of the city is derived largely from its railroad shops (those of the P., C., C. & St. L. employing 1,000 men, the largest industry), from its manufactories, and from the surrounding agricultural region, the chief products being wheat, corn, oats, and small fruits. An important industry is the Western Motor Works, manufacturers of automobile and other motors, and gray iron, brass, and aluminum castings. Kenneth quarries, two miles west of the city limits on the north bank of the Wabash, furnish large quantities of crushed limestone.

Banks and Publications. Logansport has two national banks, one state bank, and one trust company, with a combined capitalization of \$650,000, and one private bank not capitalized. There are published three daily, two semi-weekly, and five weekly newspapers, including one German paper.

Churches and Educational Institutions. The city has 16 Protestant and three Catholic churches. Its educational facilities are embraced in the Logansport Business College, Holy Angels' Academy (R. C.), a high school, the building being of Lake Superior red sandstone, and 8 ward schools, in addition to the Catholic and Lutheran parish schools.

Public Institutions, etc. Of these the most important is the Northern Indiana Hospital for the Insane, popularly known as 'Longcliff,' comprising 34 buildings, and 300 acres of land, at a total cost of \$724,164.76, and opened 1 July, 1888. Saint Joseph's Hospital (R. C.), the Home for the Friendless, the Orphans' Home, the Carnegie Library erected in 1904 at a cost of \$35,000, the Federal building completed in 1905 and costing \$75,000, and the Masonic Temple, are among the more prominent institutions. The city also has three parks, Spencer Park, about a mile east of the city limits, Riverside Park on the Eel River, and Court Park. The Soldiers' Monument in Mount Hope Cemetery, costing \$10,000, was dedicated 14 July 1887. The Logansport Home Telephone Company has 2,000 telephones and extensive connections with other places and the rural districts.

History, Government, and Population. Logansport was named after Captain Logan, a Shawnee chief, killed by the Indians in Nov.

LOGARITHMS—LOGIC

1812, near the Maumee River, and was first written Logan's Port. The first permanent settlement was made in August 1826, by Alexander Chamberlain, who erected a log cabin on the south bank of the Wabash, directly opposite the mouth of the Eel River. It was incorporated as a town '5 Sept. 1831; as a city, 3 April 1838. Its elective officers consist of a mayor, judge, clerk, and treasurer, each for four years, ineligible for two consecutive terms; and seven councilmen, one from each of the five wards, and two at large. The business of the city is largely delegated to its Board of Public Works, which consists of three members, appointed by the mayor, and not more than two of which can belong to the same political party. The three police commissioners are appointed by the governor. The city also owns and operates its own electric light and water plant. Pop. (1890) 13,328; (1900) 16,204.

CHARLES O. FENTON,
Editor 'Logansport Times.'

Log'arithms. The common logarithm of a number is the index of the power to which 10 must be raised to be equal to the number. Thus $10^3 = 1,000$, so that the logarithm of 1,000 (usually written log. 1,000) is 3. Now $10^1 = 10$, $10^2 = 100$, $10^3 = 1,000$, $10^4 = 10,000$, and it is well known that $10^0 = 1$, $10^{-1} = 0.1$, $10^{-2} = 0.01$, etc., thus:

Log. 0.001 = -3	Log. 10 = 1
Log. 0.01 = -2	Log. 100 = 2
Log. 0.1 = -1	Log. 1,000 = 3
Log. 1 = 0	Log. 10,000 = 4

It is evident that the logarithm of any number greater than 1 and less than 10 is fractional; the logarithm of any number greater than 10 and less than 100 is greater than 1 and less than 2. Again, the logarithm of any number less than 1 is negative. The logarithms of numbers have been calculated by Napier, Briggs, Mercator, Newton, Leibnitz, Halley, Euler, L'Huillier, Vlacq, Sherwin, Gardner, Hutton, Taylor, Callet, and others. Of works giving tables of logarithms we may mention those to which the names of Hutton, Callet, and Vega are respectively attached. Chambers' Mathematical Tables is a useful little treatise; it gives logarithms of numbers to seven places of decimals. Suppose we wish to know the logarithm of the number 18.1. In a book of tables we only find the fractional part of the logarithm, it is .257679. Now 18.1 is greater than 10 and less than 100, so that its logarithm is greater than 1 and less than 2; hence log. 18.1 = 1.257679. To give examples:

Log. 18100 = 4.257679	Log. 1.81 = 0.257679
Log. 1810 = 3.257679	Log. 0.181 = 1.257679
Log. 181 = 2.257679	Log. 0.0181 = 2.257679
Log. 18.1 = 1.257679	Log. 0.00181 = 3.257679

3.257679 means $-3 + 0.257679$. For a full explanation of the finding of logarithms and natural numbers by the tables see treatises on trigonometry, etc. The integral part of a logarithm is called its characteristic, the fractional part its mantissa. Logarithms make arithmetical computations more easy, for by means of a table of them the operations of multiplication, division, involution or the finding of powers, and evolution or the finding of roots, are changed to those of addition, subtraction, multiplication, and division respectively. For instance, if x and y are the logarithms of any two numbers, the numbers are 10^x and 10^y ; now the product of these

numbers is 10^{x+y} , so that the logarithm of the product of two numbers is the sum of the logarithms of the numbers. Again, the quotient of the numbers is 10^{x-y} ; so that the logarithm of the quotient of two numbers is the difference of the logarithms of the numbers. Again, 10^x raised to the n th power is 10^{nx} ; so that the logarithm of the n th power of a number is n times the logarithm of the number. Again, the n th root of 10^x is $10^{\frac{x}{n}}$; so that the logarithm of the n th root of a number is $\frac{1}{n}$ th of the logarithm of the number. Hitherto we have spoken of common logarithms, which were invented by Briggs; their base, as it is called, is 10. Now logarithms were first used by Napier of Merchiston (see NAPIER, JOHN), and he employed a base which is smaller than 10, it is the number 2.7182818..., or the sum of the infinite series $2 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots$, etc. This base is denoted by e in mathematical treatises, and the Napierian logarithm of any number, say 7, is log. e 7, to distinguish it from log. 7, which is the common logarithm, whose base is 10. The common logarithm of a number is found from the Napierian by multiplying by 0.43429448. Napierian logarithms are of great importance in mathematics.

Log'cock, a local name for either of two birds: (1) the pileated woodpecker (see WOODPECKER); (2) the woodcock (q.v.).

Loggerhead Shrike. See TURTLE.

Loggerhead Turtle. See HAWKSBILL.

Loggia, lō'j'a, a word used in Italian architecture with several significations. It was applied to a hall open on two or more sides, where there were pillars to support the roof. Such are the Loggia de' Banchi in Genoa, and the Loggia de' Lanzi in Florence. It is also applied to an open colonnade along the side of a building. The name loggia is also given to the large ornamental window consisting of several parts, which is often seen in old Venetian palaces; and lastly, it is used to designate a small airy hall, usually open on all sides, constructed on the roof of an edifice. See also ARCHITECTURE.

Log'ging, a name given by lumbermen to the practice of rolling logs from whence they are cut, or drawing them on sleds or wagons, to the stream by which they are transported to the mill. In some places logs are thus moved from one point to another by means of flumes and waterways.

Logic. Logic is that philosophical science which deals with the principles and methods of all thinking. The processes of thought, although varied in form and content, have always a single end; to interpret the past and the present, and by means of such interpretation to forecast the future. It is by thinking that we are able the better to understand the experiences of today and the more wisely to prepare for the events of tomorrow. Any object of thought—a thing, a person, an event—if it is to be really grasped by the thinking mind and to become a part of our body of knowledge, must be correctly interpreted by us. And by interpretation is meant the revelation of its essential significance in the light of the universal principle or the universal nature which the particular object under investigation

illustrates. The primary function of logic is this: the interpretation of the particular by means of the universal which underlies it. The development of all logical theory is merely the elaboration of this fundamental principle. To refer any object of consciousness to a universal is the sole method of describing its characteristics, or expressing its significance. If, for instance, I declare a certain plant to be poisonous, I have characterized it by an adjective which admits an indefinite variety of applications but preserves always one and the same essential significance, and this is the meaning and the function of the universal. Any noun which stands for a class or group of objects, or any adjective which may be variously applied, is a universal; or as it is technically known in logic—a concept. Moreover, the reference of any particular object of thought to a universal, *i. e.*, to a concept which serves to interpret it, is a judgment.

Inasmuch as the reference is always confronted with the possibility of error, it is of the very nature of a judgment to raise the question of its truth or falsity, according as the knowledge upon which it is based is accurate or inaccurate, adequate or inadequate. In the manifold conflict of opinion there is an obvious need of some definite and fundamental criterion to discriminate between the true and the false. The final court of appeal as to the truth or the falsity of knowledge must be to the main body of knowledge as a whole. This is the test: does the new experience square with our accumulated experience or not? Truth as regards its logical significance must measure up to this supreme standard, namely of consistency with all that constitutes the world of knowledge as we understand it. As the judgment is the logical vehicle of expressing truth, it is natural that it should take the form of a reference of the immediate object of consciousness to the general body of knowledge which has been already received, tested, and assimilated by the mind. Thus, every new experience is to be illuminated and interpreted by the old. This is the program of thought and the way of all logical procedure and progress. However, there can be no essential progress in thought when the judgment is merely the recognition of the appropriate place of a new thought in our general body of knowledge. Progress is manifest when the object of thought, in the light of our knowledge as a whole, gives rise to some new idea which is not expressed in the given object of thought alone, nor yet in our general body of knowledge alone, but which is nevertheless necessitated and revealed by the combination of the two sources taken together. Our general body of knowledge contributes a part, and the given object of thought contributes the other part. When brought together the two parts fuse into one, forming a complete whole. Thought in this sense is creative. The given elements at hand may be old, but thought constructs them into new forms, ever adding to the store of knowledge from the very elements which knowledge itself furnishes. This process is the consummation of all the various logical functions and is known as the process of inference. Inference is possible because our

judgments contain more knowledge than they ever express upon the surface. There is a deposit of knowledge which is implicit in every judgment, and this is due to the fact that all of our judgments are interrelated and interdependent. The complete significance of a judgment is revealed only in the light of all its relevant and cognate judgments. The implicit becomes explicit only when a given judgment is brought into relation to some other judgment which has already been tested and found place in our body of general knowledge; this is what occurs in the process of inference. For instance, if it is asserted that a bar of soft iron will become a magnet if an electric current is allowed to pass through a coil of wire wound about it, such an assertion is based upon our general knowledge which is contained in the judgment that a current of electricity passing through a coil of wire always transforms an iron bar within the coil into a magnet. Without this general knowledge the mere fact of having a coil of wire wound around a piece of iron would be meaningless. To have any significance such a fact must have the light of our general knowledge brought to bear upon it. Then only does the given fact become suggestive and fertile in the increase of knowledge. Or again, if in any triangle there are given the two angles and the included side, one can infer by means of the knowledge of trigonometrical principles the other angle and the remaining two sides. Such a process of inference consists in the combination of what is given with certain general principles which constitute a part of our body of knowledge. That which is given without the general principles to interpret and develop it in all of its implied bearings and relations would remain devoid of significance and with no value as knowledge whatsoever.

In inference, therefore, there is always the extension of our knowledge, for the given judgment contains something which is not apparent when observed in its own light simply, but which is revealed only in the light which plays upon it from our general body of knowledge as a central source of illumination.

The ground of inference, indeed, that which makes the inferential process a possibility at all, is the supposition which we are constrained to make and upon which we are constantly resting in the exercise of our reasoning faculty, namely, that the various elements which constitute our body of knowledge as a whole must be related to each other in such a way as to form a system of interconnected and interdependent parts. When we have given a single part, other parts of the whole to which the part belongs can be inferred, because of our knowledge of the general system which binds them together through the inner connections of necessity. That which is implicit in any judgment and which forms the germ of inference can be revealed only when one thoroughly understands the complete system of relations and connections which underlies the judgment in question. If our knowledge were not systematized, and the various parts duly related and properly co-ordinated and subordinated each to each, then there could be no basis for any inference, and no possibility of constancy and

consistency in our thinking. As aids to systemization there are the processes of definition, division, and classification which are treated at length in textbooks on the formal logic and can only receive passing mention here.

While inference depends upon organized knowledge it is also instrumental in producing the very organization of our knowledge itself. It draws from it and at the same time it contributes to it. This two-fold function gives rise to the two kinds of inference, known as deductive and inductive. In deductive inference we proceed from our general knowledge to the characterization of the special case which depends upon it; or inasmuch as our general knowledge is expressed in the form of universal concepts we can put it simply—that deduction is from the universal to the particular. Induction, on the other hand, is from the particular case, or rather particular cases, to the universal. It is essentially a process of generalization, by which we rise in thought from the investigation of special cases to the universal principle or law which embraces them and underlies their nature. Inference is always either the interpretation or else the elaboration of knowledge. When that which is given is illuminated by some universal principle or law so that its implicit significance is thereby made explicit, we have the process of deduction. But when there is no recognized universal, and such is evidently to seek, then we turn naturally to the relevant instances before us so as to discover in them some suggestion of the desired law or principle. Such a procedure is induction. For example, when the physicist sees certain dark lines in the solar spectrum, he infers that they indicate the presence of iron vapor in the sun. This is deductive inference because it is a process of thought which rests upon the universal and well-known connection between certain definitely positioned lines in the solar spectrum and the presence of iron. On the other hand, however, suppose the investigator is ignorant of the meaning of these dark lines. In his knowledge they possess no significance whatever and suggest nothing to his mind. It is obvious that he must experiment in various ways with the phenomena of these lines until he is able to discover their general relations and significance. Then he will be able to formulate the results of his investigation in a universal law which not only shall embody the special cases coming under his observation but all others also of a similar nature. It will be readily seen that deduction and induction are complementary phases of one and the same process. With every special case which comes before consciousness one of two methods of procedure is possible, that is, if it is to be the subject of inference at all; if it evidently falls under some universal law or principle to which we do not hesitate to refer it, then it becomes invested with the full purport and significance of such a universal; if, however, there is no recognized universal to which we can refer it, the special case presents a problem for us to solve by experiment and observation, namely, what is the universal which we are constrained to believe must underlie it, and which the special case in some way not yet revealed necessarily illustrates. Whenever, therefore, we face a

new experience, a new fact or event, we must treat it by one or the other of these two methods according as our knowledge is adequate to its interpretation or not. In the one case we are reasoning deductively; in the other, inductively. Where the limitations of knowledge obstruct progress in one direction, it is possible to proceed in the other direction so as to remove eventually these very limitations themselves. If we do not possess sufficient knowledge to suggest the appropriate universal from which to reason deductively, we can proceed in an inductive manner to search for the universal which invites our investigation.

In our thinking these two processes cannot be separated, for some elements in the phenomena under observation appear immediately illuminated by our knowledge, others again are not so illuminated but when properly tested are found to emit the light which is in them; these various elements are so closely joined together that the two processes must ever run parallel.

The form of inference which best illustrates the deductive reasoning, although by no means exclusively, is that of the Syllogism (q.v.). The syllogism is that method of reasoning which combines two judgments so as to produce a third; as for example:

Whatever turns blue litmus paper red is an acid. This compound turns blue litmus paper red. Therefore, it is an acid.

It will be observed that the two judgments which combine to produce the third have a term in common; this is called the middle term of the syllogism. Moreover, the third judgment or conclusion is proved by the process of eliminating the middle term, and taking as the subject and predicate of the conclusion the remaining terms of the given judgments. The subject of the conclusion is called the minor term; the predicate, the major term; and of the two given judgments, the one containing the major term is called the major premise, and the one containing the minor term, the minor premise. It is the peculiar function of the major premise to exhibit some aspect of our general knowledge; and of the minor premise to exhibit a more particular phase of our general knowledge, or as it more frequently occurs some special case embodied in a concrete experience. It is the combined function of the two together to apply some portion of our general knowledge to a special case so as to yield its true interpretation. It is impossible to discuss here at length the various rules by which the validity of the syllogism may be tested. It may be said, however, that the rules of the syllogism depend upon the fundamental principle that if a special case can be proved to fall within the area of a universal, then the inference follows that the special case becomes invested with the essential characteristics of the universal itself. But if the special case falls outside the scope of the universal, either wholly or in part, then the inference does not follow. For instance, in all cases at law the special case is referred to some law principle, that is, to a universal which completely covers its essential significance and thereby determines the issues of the trial with the attending damages or punishment. Whenever a judicial

decision is reversed by a superior court it is because the special case under investigation did not properly come under the law principle to which it was referred. It is obvious that the syllogistic method of reasoning admits of abuse by connecting premises in a merely formal manner which have no real connection. Such an artificial and mechanical treatment of the syllogism leads naturally to empty subtleties and weak sophistries. It was this exclusive emphasis upon the formal and technical side of the syllogism that brought the writings of the schoolmen to such ill repute, so that the term scholastic has become suggestive of a complete divorce of thought from reality. Aristotle, to whom we owe the formulation of the syllogistic method of reasoning, placed supreme stress upon the real connection which must underlie all formal relationship in the structure of the syllogism. Thus he states that "the middle term must express the real cause," *τὸ μὲν γὰρ αἰτιον τὸ μέσον*. Anal. Post. ii. 2, 90A 6.

The force of Aristotle's observation will be appreciated if we trace the usual process of thought whenever any judgment of ours is questioned. Suppose that one asserts that there is going to be a storm within a few hours, and he is asked concerning the ground of his opinion. The reply would be that there is a rapidly falling barometer, and also that a rapidly falling barometer indicates an approaching storm. Here the middle term, "rapidly falling barometer," serves to unite the universal judgment to the special case as observed and at the same time to connect the two parts of the reasoning process by a real tie representing the underlying cause upon which they are based. Inference, indeed, is often defined as the process by which the ground of a judgment is explicitly disclosed.

The ordinary categorical syllogism, that is, one which is formed of judgments in the simple form, x is y , although it is essentially grounded in the causal relation, nevertheless in a large measure conceals it. On the other hand, in the hypothetical syllogism, whose major premise is a hypothetical judgment, that is, of the form, If x is y , z is w , and whose minor premise affirms or denies one of these two clauses categorically, the causal relation is brought into the foreground, inasmuch as it states explicitly a consequence as dependent upon its ground. There is still another kind of syllogism known as the disjunctive syllogism in which the major premise is a disjunctive judgment that is of the form, x is either z or w , and the minor premise is an affirmation or denial of one of these alternatives while the conclusion is the corresponding denial or affirmation of the other. This affords a method of reasoning by elimination, and is most useful in deciding between possibilities. In this form of the syllogism the causal relation is not expressed on the surface at all, but is essentially implied; for in order to state possibilities one must know all of the underlying causal relations of the system in which these possibilities emerge. For instance, one cannot state that the contents of a stomach which have been chemically examined indicate the presence of arsenic or antimony unless there is known also the exact causal connection between these two

poisons and the partially digested food; the disjunctive judgment standing as the major premise of the disjunctive syllogism always presupposes some definite knowledge of determining causal relations which exist in the system under consideration.

The validity of the syllogism turns, as will be readily seen, upon the possibility of referring a special case to its appropriate universal. But there are often situations and circumstances when this method of reference is not at all possible and yet nevertheless a valid inference can be drawn. In other words, the syllogistic procedure by no means exhausts the possibility of deductive inference. There may be other relations which grow out of a system of interconnected parts and which are of such a nature as to warrant an inference from them. For instance, we may have the following inference:

The two angles of a triangle, A and B, equal 95° . Therefore, the third angle must equal 85° .

This is not a syllogism proper and yet is a perfectly valid course of reasoning. While there is no middle term there is an identical point of reference, namely, the given triangle; and there is also the universal upon which the inference depends, namely, the relations which underlie the very nature of the triangle itself and are rendered constant by it. Thus, all of the essentials of inference are found to be present in such a form of reasoning. Various kinds of inference may thus arise according to the different relations which may obtain in the system wherein they occur. To have a valid inference in any such case we must establish some identity of relation between the parts which we are comparing; otherwise we cannot logically pass from one to the other. And identity of relationship can be established only in systems of such simplicity that no unknown elements which might enter to disturb the existing relations can be conceived. Our thought in other words must command the system completely; otherwise we are never justified in using our knowledge as the basis of reasoning.

In the inductive process as we have seen, the procedure is from particular instances to the universal which underlies them and which they illustrate; there is here, however, an evident break in the continuity of the logical process. The conclusion contains more than the premises; for in the universal reached by induction our knowledge goes beyond our actual experience. This is the so-called "inductive leap" or "inductive hazard." It is not, however, a leap in the dark. Such it would be, were we compelled to use the mere data of experience as the sole ground of our inferences. But it is possible to formulate as a postulate, some universal truth which the mind is constrained to assume and which serves to bridge the gap between the particular and the universal. This postulate has been variously expressed by different authors yet with substantially the same underlying significance in all. In the older logic this is put in the convenient formula of "the uniformity of nature," that is—beyond the sphere of experience phenomena are supposed to behave under like conditions in the same manner as in the sphere of immediate observation and experiment. In the modern logic, the phrase "uniformity of consciousness" takes

the place of "uniformity of nature," the latter being regarded as somewhat indefinite and as implying a view exclusively objective. By "uniformity of consciousness" is meant, that our knowledge must be consistent throughout with itself, part to part, and parts to the whole, and that the world for us is the world as it is constructed and interpreted by our knowledge. Whenever a concrete instance is present in consciousness it is to be regarded as having its appropriate place in a system of universal and necessary relations, so that a correct interpretation of the concrete case must reveal the universal element which underlies it and gives it a place and meaning in our world of knowledge. Nature after all is only another word for the world as we know it—a world of universal and necessary relations; otherwise it could not be a world of order and uniformity.

The one relation above all others which enables us to discover the universal significance of concrete instances is the relation of cause and effect. When in the phenomena of nature or the events of life, a simple causal relation can be discovered, even though it is illustrated only in a certain case, there is sufficient ground for the generalization of the connection thus discovered. The method of inductive investigation, therefore, consists in various tests for the exhibition of true causal relations of such a simple nature as to furnish evidence that these relations are both definite and constant. A complex relation is too indefinite and variable to warrant any generalization which is based upon it. But however complex the phenomenon may be, it may be always subjected to some process of analysis which will reveal a more simple causal relation underlying it. Moreover, it is necessary by proper inductive tests to discriminate between a causal connection and a mere coincidence. All of this is provided for in the so-called inductive methods—the method of agreement, of difference, of agreement and difference, of concomitant variation, and of residues. These are essentially the methods of scientific procedure, the methods of research and experimentation. The function of hypothesis in inductive investigation must not be overlooked. An hypothesis is a supposition which is made concerning the probable cause of a phenomenon either as preliminary to an experiment which may prove or disprove the supposition or in the place of an experiment or systematic observation when such are impossible owing to the peculiar conditions of the phenomenon itself. In the first instance the function of hypothesis determines the line of experiment in a definite manner and does not leave the phenomenon in question to indeterminate and haphazard investigation. This may be illustrated by a quotation concerning Charles Darwin, taken from the 'Reminiscences' of his son, Francis Darwin: 'He often said that no one could be a good observer unless he was an active theorizer. It was as though he were charged with theorizing power ready to flow into any channel on the slightest disturbance, so that no fact however small could avoid releasing a stream of theory and then the fact became magnified into importance. In this way it naturally happened that many untenable theories occurred to him; but fortunately his richness of imagination was equalled by his

power of judging and condemning the thoughts that occurred to him. He was just to his theories, and did not condemn them unheard; and so it happened that he was willing to test what would seem to most people not at all worth testing.' ('Life and Letters of Charles Darwin,' Vol. I, p. 126.) But there is a second function of hypothesis,—where an explanation is needed to account for phenomena which it is impossible to reproduce in the form of an experiment. We are not always able to perceive the relations between facts and yet we are constrained to think of them as related; but in order to systematize them we must supply the *lacunæ* which appear in the phenomena as perceived. A supposition of this nature which is necessary in order to construct a body of facts into a system is an hypothesis,—as for instance the nebular hypothesis of Laplace. No course of reasoning, however, can be carried on to any extent or to any effect which does not combine the two processes of deduction and induction in a manner provided for by the complementary relation which they sustain one to the other. The combination of the deductive and inductive processes has been called by John Stuart Mill the Deductive method simply. A more distinctive name however would be,—the Inducto-deductive method. This combined method consists of three stages:—

1. A preliminary process of induction whose results may be expressed tentatively at least in the form of a universal law or principle.

2. A process of deduction based upon this universal principle or law as its major premise, and thus extending our knowledge to the determination of new cases which have not as yet gained a place in our body of knowledge.

3. A process of verification, by which the results of the process of deduction are compared with the facts as actually observed. When there is not an exact correspondence between the theoretically deduced results and the observed facts, and we are able to assure ourselves that there has been no flaw in the processes of deduction, then the original induction stands as so far forth discredited, and must be revised so as to square it with fact. This combined method of deduction and induction serves as a check on the one hand upon all tendency to hasty generalization, and on the other it is most valuable as a means of extending our knowledge into unknown regions beyond the sphere of immediate observation. We are constantly using our inductive results as a basis for a deductive inference concerning the things not yet seen; and then when seen, at once comparing the former inference with present fact we are either confirmed in the result which we had reached by the processes of reasoning, or else compelled to discard the earlier inference as false or inadequate as may be. The unseen which we are determining in our minds by what we think the seen necessitates we are however from time to time compelled to alter. Bacon has insisted that "anticipations of nature" are a source of innumerable errors, and that the truly scientific method consists in the interpretation of nature by means of direct observation and experiment simply. It must be remembered however that it is largely through these anticipations of nature that progress in science has been attained. A distinction must

be drawn between anticipations of nature which are subjected to careful verification and those which are in themselves regarded as final.

JOHN GRIER HIBBEN,

Professor of Philosophy, Princeton University.

Logic, Symbolic. Symbolic Logic, or Mathematical Logic, or the Calculus of Logic,—called also the Algebra of Logic (Peirce), Exact Logic (Schroder), and Algorithmic Logic or Logistic (Couturat),—covers exactly the same field as Formal Logic in general, but differs from Formal Logic (in the ordinary acceptance of that term) in the fact that greater use is made of a compact symbolism—the device to which mathematics owes so largely its immense development.

Formal Logic may be defined as that science which has for its object the complete analysis and systematic presentation of the principles and methods of deductive reasoning, or the type of reasoning in which conclusions are drawn from given premises. It is not concerned with the truth of the premises or of the conclusions, but simply takes care that if the premise is true the conclusion shall be; it is the study of the forms of valid inference without regard to the content or subject-matter

of the propositions which are inferred or of those from which the inference is drawn. Symbolic Logic is then that treatment of Formal Logic which employs, instead of many of the words of ordinary language, a system of special symbols which secure not only greater precision and compactness, but also greater generality in its discussions. These symbols, like the symbols of mathematics, form, in reality, a new symbolic language; and it may be said that the choice of a convenient and accurate symbolism has been, in logic as in mathematics, an indispensable condition for the progress of the science.

A partial use of symbolism in Formal Logic is as old as the time of Aristotle; for example, 'If both A and B include the whole of C , it follows that some A is B .' What is called Symbolic Logic simply carries this device farther; it would express the whole of the above statement in symbols, as, for example, thus: $A \supset C, B \supset C: \therefore A \cap B$. The immense advantage that accrues from the full carrying out of this idea of Aristotle's can only be realized by those who have given some attention to mastering the details of the method.

The thorough-going application to Formal Logic of the symbolic method, with the accompanying extension of the field of logical inquiry, is a development of the latter half of the 19th century. The essential features of the modern theory, to be sure, were known to Leibniz as early as 1700, and some valuable contributions were made by Lambert in 1781; but the first work which brought the possibilities of the symbolic method forcibly to the attention of logicians was 'An Investigation of the Laws of Thought,' by George Boole, in 1854; and Boole is commonly regarded as the founder of the modern science. The new ideas did not at first meet with favor; the logicians, wedded to the classical methods, in which reasoning is carried on by means of living words, refused to admit what they called a mathematical intrusion into their science; while the mathematicians on their side regarded the whole movement as of no possible interest except to logicians. The field remained for some decades a no-man's land between mathematics and logic; the few who cultivated it worked largely without knowledge of previous or contemporary workers in the same field; and the difficulty of defining the relation of logical symbolism to mathematical form, and the limits of the analogy between them, led to many errors. By the end of the century, however, owing to the labors of Peirce and Schroder, the new methods had established themselves on a sound footing, and had proved their value in logical investigations. To mention only the illustration of their power, the Syllogism, and the so-called 'laws of thought' (namely, the principle of identity, the principle of contradiction, and the principle of excluded middle), have now been completely analyzed by the symbolic method, with results for which most logicians were not prepared: in the first place, it is now known that the three 'laws of thought' are entirely independent of one another, in the sense that no one is a necessary consequence of the other two; secondly, that the principle of the syllogism, in its primitive form, is not a consequence of the other three laws, but must be assumed as a separate principle; and

finally that all four of the laws taken together are not sufficient for some of the most elementary processes of mathematical reasoning—that for these an entirely different discipline is required, namely, the Logic of Relations (see below). This example alone is sufficient to justify the assertion that the study of Symbolic Logic has put a wholly new spirit into the Logic of Aristotelian traditions, and has transformed a discipline which had remained nearly stationary since the Middle Ages into one of the most progressive of the modern sciences.

While this development was taking place in Logic, an equally important movement in a similar direction was being carried forward in the field of Pure Mathematics, and a brief account of this movement must be given before we can understand the present position of Symbolic Logic. Up to the middle of the 19th century, mathematics had been so busily engaged in testing the power of the newly acquired calculus of Newton and Leibniz, and obtaining results by its aid, that few inquiries had been made into the logical foundations of the theory. Since that epoch, however, increasing attention has been paid to these fundamental questions, among the early leaders being such men as Bolyai, Lobatchevsky, Cauchy, Weierstrass, Riemann, De Morgan, and Robert Grassmann, all of whom, except the first two, were contemporaries of Boole's. The first result of these inquiries was the recognition, more clearly than ever before, that every mathematical theory is based on a small number of fundamental hypotheses, or postulates, from which all the other propositions of the theory can be deduced, and careful lists of postulates are now being worked out for most of the important mathematical branches. Secondly, it became increasingly evident that the real interest of the mathematician lies not so much in the material content of the hypotheses which he assumes, as in the logical processes by which further propositions are deduced from those hypotheses. The natural outcome of this conviction was an immediate and very great extension of the field of mathematical inquiry. No longer confined to the study of number, quantity, and space, mathematicians invented for themselves new systems of hypotheses, and deduced from them new theories. Any set of postulates would serve, provided they involved no internal contradiction, and in the exuberance of new freedom, the subject-matter was sometimes chosen with an almost playful disregard of practical utility. Perhaps the most striking example of the new tendency was the acceptance of the non-Euclidean geometries of Lobatchevsky and Bolyai as legitimate branches of mathematics. These theories had at first been regarded as heretical, or at least as non-mathematical; but now, when it became clear that their assumptions, though unusual, were still not self-contradictory, they were assigned their proper places as hypothetical-deductive theories; they therefore became as much a part of mathematics as the older theory of Euclid, that theory being itself now recognized as a hypothetical-deductive theory; and the mathematical interest of either theory was seen to be quite independent of the question whether an illustration of it could or could not be found in the world of space-perceptions. Another example is that of Hamilton's quater-

nions, which is a new algebra in which the fundamental assumptions differ in several respects from the laws which hold in the more familiar algebra of quantity. Similarly, all the host of artificial algebras, the invention of which was promoted especially by Hankel (1867) and Benjamin Peirce (1870), are hypothetical-deductive theories exhibiting varying degrees of divergence from the ordinary algebra of quantity; perhaps the simplest of all these algebras is that invented by Boole himself for the purposes of symbolic logic. In arithmetic and geometry the work of Peano, Padoa, and Pieri in Italy, and of Pasch, Frege, and Hilbert in Germany, should be especially mentioned. Finally, the theory of abstract groups, and the whole operational calculus, are outgrowths of the same tendency. In short, pure mathematics came to be regarded, at the end of the century, as a collection of hypothetical-deductive theories, distinguished from one another by the nature of the assumptions adopted as the basis of each theory, but depending for their mathematical interest not so much on the material content of those assumptions as on the logical relations between the resulting propositions.

As the outcome of these two movements, therefore, the sciences of logic and mathematics found themselves in a wholly unexpected position at the beginning of the 20th century. Instead of being separate, almost antagonistic, disciplines, they suddenly discovered that they were both working in the same direction—that their problems and aims were identical. The field of symbolic logic, which had hitherto occupied a rather uncomfortable position between the two opposing forces, now became the common meeting-ground where mathematicians and logicians can work together to mutual advantage. The researches of Peirce and his pupils in America, and of Schröder in Germany, became more widely known. Peano and his school in Italy began the publication of the (*Formulaire de Mathématiques*), which is intended to become a complete cyclopedia of mathematical knowledge, expressed in the language of symbolic logic. Russell and Whitehead in England, and Couturat in France, became active exponents of the new mathematical-logical theory. Even the strictly mathematical researches of Georg Cantor began to arouse a lively interest among the logicians. Finally, it remained for Russell (1903) to announce the surprising thesis that logic and mathematics are in reality the same science; that pure mathematics requires no material beyond that which is furnished by the necessary pre-suppositions of any logical thought; and that formal logic, if it is to be distinguished as a separate science at all, is simply the elementary, or earlier, part of mathematics.

It is too early to predict what the final outcome of this new movement will be; the limits of the inquiry are not yet well defined; the terminology and notation are still in an experimental stage; many important matters of detail are likely to remain for some time in debate; but at any rate this much is clear: a new program has been proposed for mathematics and logic, and the true nature and scope of what is now called symbolic logic cannot be finally determined until this broader question of the relation between logic and mathematics

is decided. It may be that, in the merging of these two sciences, no place will be left for symbolic logic as a distinctive science; it may be that the studies now pursued under that name will be supplied with a more appropriate title; or it may be that some new form of symbolic logic will absorb the whole of logic and mathematics.

In view of these considerations it is clear that any account of the subject which can be given at the present time must be regarded as tentative and transitional—a snap-shot at a rapidly moving phenomenon—certain to become obsolete with the change of perspective which is taking place in all our mathematical-logical notions. The sketch which now follows, after this long introduction, must therefore be understood as containing not a body of universally accepted facts, but merely the writers' individual selection of some of the results which, in their view, seem most likely to become of recognized value.

The main results which Symbolic Logic claims to have secured are briefly the following:

1. A thorough-going investigation into the foundations of Logic,—an enumeration of appropriate groups of first principles (axioms and postulates) and the deduction from them of the whole structure.

2. The furnishing of a wonderfully concise and compact method of expressing premises and deductions from premises. It is impossible to overestimate the mastery which this gives over trains of thought.

3. A method for putting any number of premises, of any degree of complexity, into the intellectual mill, and extracting *all* the information which they convey about any term or any combination of terms, without the fatigue of conscious reasoning. Machines have been devised, like Jevons' "Logical Piano," by which these conclusions can be reached (not, however, in interesting forms) without even the aid of paper and pencil. The only difficulty is to find any *real* problems that are hard enough for this branch of the subject to attack.

These results have been due to:

(a) The generalization of the relation *is, implies* (made possible by the convention that "all *a* is *b*" does not involve the existence of *a*; this generalization is due to Leibniz).

(b) The introduction of the logic of *and* and *or* (there is no reason why Logic should not discuss, e.g., equivalences—perfectly common in real life—such as "The undevout astronomer is mad=Any astronomer is either mad or else devout").

(c) The introduction of the Special Terms, $\circ$ and ∞ (nothing and everything, or the non-existent and the existent).

(d) The excision of the non-valid syllogisms, and hence the reduction of valid syllogisms to a perfectly symmetrical collection, all (universal and particular) tested by *one* simple and easy rule.

(e) The introduction of an appropriate symbolism.

As has already been intimated, much of the new matter of modern Logic has no necessary connection with its symbolism. The first four of the above improvements could perfectly well have been attained without its use; that they were not, is the greater proof of the utility and power of the symbolic method.

For the purposes of more detailed exposition, the subject may be divided into three parts:

- (1) The Logic of Classes or Concepts;
- (2) The Logic of Propositions; and
- (3) The Logic of Relations;

although this can hardly be called a scientific division. (The use to which the term "Algebra of Logic" is now commonly restricted will be explained below.)

1. *The Logic of Classes or Concepts.*—In conducting any scientific inquiry, we usually, whether consciously or unconsciously, confine our attention to a particular realm of thought, which may be called the universe of discourse, or simply the *universe*, for that particular inquiry; any object outside the universe is irrelevant to the discussion. For example, astronomy deals with the universe of material objects on a large scale; anthropology deals with the universe of human beings; botany deals with the universe of flowers and plants; etc., etc. This universe, in any particular discussion, is represented by the symbol ∞ , or by the symbol 1 .

Within any given universe, we have to speak of classes, a *class* being a group of objects of thought which are distinguished in any way from the rest of the universe. The objects belonging to a class are usually characterized by the possession of certain common characters in which we are interested; and of these characters we then may form a "concept." But in Symbolic Logic we view a class merely as (in any way whatever) distinguished from the other classes of the universe.

Any class is represented in Symbolic Logic by a letter of the alphabet, and the complementary class, comprising all the rest of the universe, by the same letter with a dash or accent. Thus, in the universe of men, we may let a =the class of Americans, b =the class of bankers, and c =the class of Californians; then a' will represent the class of all foreigners, b' the class of all non-bankers, and c' the class of all men who do not live in California. Of course it is possible at any time to enlarge the borders of our universe, so that, for example, b' may come to mean not only all men who are not bankers, but also all things of any kind which are not bankers, as microbes, demonstrations, virtues. In any case, two classes x and x' together exhaust the universe considered, and have no part in common; either of two such classes is called the *negative* of the other. When a criterion, or means of distinguishing the objects of a class x from the rest of the universe, is so defined that no object in the universe will satisfy this criterion, it is convenient to speak of x as an "empty" or "null" class. Any null class is represented by the symbol $\circ$. Thus, the class of all plane figures which are at the same time round and square, and the class of all prime numbers which end in the digit 4, are examples of null classes.

The common part of two classes x and y is represented by xy , and is called their *logical product*. Thus, in our example, ab =the class of American bankers, $a'b$ =the class of foreign bankers, $a'c$ =the class of foreign Californians (this last being of course a null class).

The class composed of two classes x and y together (whether or not these classes overlap) is represented by $x+y$, and is called the *logical*

sum of x and y . Thus, $a+b$ =the class containing all Americans and all bankers; $a+a'b$, or the class containing all Americans and all foreign bankers, is of course the same class.

When two classes x and y are given, it may happen that every element of x is also an element of y ; this relation is represented by $x \prec y$, and is the *fundamental relation* which may exist between two classes. Thus, in our example, $c \prec a$, since every Californian is also an American. If it happens that $x \prec y$, and at the same time $y \prec x$, we write $x=y$; that is, the symbol $=$ in logic is merely an abbreviation for two reciprocal relations $\prec$ between the terms which it connects.

Obviously $x \prec \infty$, whatever x may be; if it happens also that $\infty \prec x$, then and then only it will follow that $x=\infty$. Similarly, the equation $x=0$ is equivalent to the two relations $0 \prec x$ and $x \prec 0$, the first of which, like $x \prec \infty$, is tautologous, being true for every value of x .

We give next, without proof, a list of the principal theorems which have been discovered concerning the fundamental notions represented by ∞ , 0 , x' , xy , $x+y$, and $x \prec y$. (The names attached to some of the theorems are the outgrowth of a varied and uncertain history, and do not always suggest very clearly the meaning of the theorem.)

1. $a \prec a$. (Principle of identity.)
 2. If and only if $a \prec b$ and $b \prec a$, then $a=b$.
 3. If $a \prec b$ and $b \prec c$, then $a \prec c$. (Principle of the syllogism; see also theorems 22 and 23, below.)
 4. $a+a=a$ and $aa=a$. (Tautology.)
 5. $a+ab=a$ and $a(a+b)=a$. (Absorption.)
 6. $a+b=b+a$ and $ab=ba$. (Commutative laws.)
 7. $(a+b)+c=a+(b+c)$ and $(ab)c=a(bc)$. (Associative laws.)
 8. $a+(bc)=(a+b)(a+c)$ and $a(b+c)=(ab)+(ac)$. (Distributive laws.)
 9. $a \prec a+b$ and $ab \prec a$. (Simplification.)
 10. If $a \prec y$ and $b \prec y$ then $a+b \prec y$; and if $x \prec a$ and $x \prec b$, then $x \prec ab$.
 11. If $a \prec bc$, then $a \prec b$ and $a \prec c$; and if $b+c \prec a$, then $b \prec a$ and $c \prec a$.
 12. If $a \prec b$, then $a+b=b$ and $ab=a$.
 13. If $a \prec b$ and $x \prec y$, then $a+x \prec a+y$ and $ax \prec ay$.
 14. $0 \prec a$ and $a \prec \infty$.
 15. $a+0=a$ and $a\infty=\infty$.
 16. $a+\infty=\infty$ and $a0=0$.
 17. $aa'=0$ and $a+a'=a$. (Principle of contradiction, or exclusion; and principle of excluded middle, or exhaustion.)
 18. If $x \prec a$ and $x \prec a'$, then $x=0$; and if $a \prec y$ and $a' \prec y$, then $y=\infty$.
 19. $(a')'=a$. (Double negation.)
 20. If $a \prec b$, then $b' \prec a'$. (Contraposition.)
 21. $(a+b)'=a'b'$ and $(ab)'=a'+b'$. (De Morgan's Theorems.)
 22. If $ax+bx'=0$, then $ab=0$.
 23. If $(a+x)(b+x')=\infty$, then $a+b=\infty$. (Theorems 22 and 23 are other forms of the principle of the syllogism.)
 24. $\infty \neq 0$. (Postulate of existence.)
 25. $\infty = a+a'$
 $= (a+a')(b+b') \dots$
 $= ab+ab'+a'b+ab'+\dots$
 $= abc+abc+ab'c+\dots$
- and $0 = aa' = aa'+bb' = aa'+bb'+cc'+\dots$
 (Formulae for the complete development of ∞ and 0 .)

$$26. (pab+qa'b+rab'+sa'b')' = p'ab+q'a'b+r'ab'+s'a'b'.$$

(Formula for obtaining the negative of a well-developed expression,—of great utility in the solution of problems.)

In verifying the truth of these theorems, the familiar Eulerian circles may render some service by exhibiting to the eye the relations of the several terms; but Euler's diagrams become inadequate and even misleading in any really fundamental discussion, because they fail to represent satisfactorily the negative term, the complete introduction of which into modern logic is one of the most important enlargements of the subject. A better method of diagrammatic representation has been proposed by Venn (*loc. cit.*).

2. *The Logic of Propositions.*—We now turn to the second division of our subject, which will prove to be not a separate branch of the theory, but merely another aspect of the branch already considered.

In this branch of the subject, letters are used to represent not classes, but propositions, and the notation $x \prec y$ is used to express the relation: "the proposition x implies the proposition y ," or "the truth of x entails the truth of y ." For example, if p =the proposition that John Smith endorsed this protested note, and q =the proposition that he is liable for its payment, then $p \prec q$. Here, as in the logic of classes, the notation $p=q$ is used to express the double relation $p \prec q$ and $q \prec p$. When p is any proposition, then p' , or p with a dash above it, represents the proposition contradictory to p , which is called the *negative* of p .

The notation pq , called the *logical product* of p and q , represents a proposition the assertion of which is equivalent to the simultaneous assertion of the propositions p and q ; and $p+q$, called the *logical sum* of p and q , represents a proposition the assertion of which is equivalent to the alternative assertion of the propositions p and q . For example, if p = "the testator was of sound mind," q = "he acted freely," and r = "his will is admitted," then $pq \prec r$, since the simultaneous assertion of p and q is sufficient to prove the truth of r (or, in the contrapositive form of the statement, $r' \prec p'+q'$); it happens that in this particular case we have also $p'+q' \prec r'$ (or its equivalent, $r \prec pq$), since if either p or q is false, the will is disallowed. Hence we may embody the complete statement of the situation in the equations $pq=r$ (or $p'+q'=r'$); but it must be constantly borne in mind that every such equation stands for the simultaneous assertion of two statements, the one a sufficient and the other a necessary condition.

Finally, the symbol ∞ is used in this theory to represent any typical true proposition, such as $2+2=4$; and the symbol 0 is used to represent any typical false proposition, such as $2+2=5$. These symbols enable us to express the assertion of the truth or falsity of any proposition as follows: $\infty \prec p$ is equivalent to the assertion " p is true"; and $p \prec 0$ is equivalent to the assertion " p is false." Obviously $0 \prec x$ and $x \prec \infty$, whatever the value of x ; so that the relations $\infty \prec p$ and $p \prec 0$ may be replaced by $p=\infty$ and $p=0$, respectively. Two propositions, p and p' , will be contradictory when and only when $p+p'=\infty$ and $pp' = 0$.

If now we proceed to give the theorems which hold concerning the notions we have just represented by ∞ , o , x' , xy , $x+y$, and $x \prec y$, we shall find that all the theorems 1-26 given in the previous section for the theory of classes hold also here, if the symbols are interpreted according to the theory of propositions. For example, the theorem: "If a class a lies within the common part of two classes b and c , then it lies within b and also within c ," and the theorem: "If a proposition a implies the simultaneous assertion of the propositions b and c , then it implies a and also implies b ," are each expressed by the same symbolic form, namely (11): "If $a \prec bc$, then $a \prec b$ and $a \prec c$." And so for each of the other theorems. This remarkable similarity between the theory of classes and the theory of propositions was stated by Leibniz, but was first fully developed by Boole.

As a most interesting example of the way in which compound propositions can be handled by the Logic of Propositions, we mention Mrs. Ladd-Franklin's "inconsistent triad":

$$(ab = o)(b'c = o)(ac \neq o) \prec o;$$

since this is the form to which all the 8192 valid syllogisms (both universal and particular) can be reduced. By transposing the third factor, we have the universal syllogism: $(ab = o)(b'c = o) \prec (ac = o)$; and by transposing the second factor we have the particular syllogism: $(ab = o)(ac \neq o) \prec (b'c \neq o)$; the "inconsistent triad" thus furnishes a perfectly general rule for testing the validity of any syllogism.

The Logic of Classes and the Logic of Propositions are included together in the 'Algebra of Logic' of Peirce and Schröder; in recent years, however, the term 'Algebra of Logic' has come to be used in a more mathematical sense, which will be explained in the following section.

The Algebra of Logic, strictly so called.—If we define terms in general to be any objects of thought which can be elements of an asserted relation—whether simple terms, like classes or concepts, or compound terms, like propositions, relations between propositions, etc.—we may say that the logic of classes and the logic of propositions have, formally, the same fundamental notions to deal with, namely: (1) terms, represented by letters of the alphabet; (2) two special terms, o and ∞ ; (3) three functions of terms: negations (x'), sums ($x+y$), and products (xy , or $x \times y$); and (4) the primitive relation between terms, expressed by $x \prec y$, which may itself (in its non-assertive form) be a term of a compound proposition; moreover, the theorems 1-26 are true formulæ in the one theory as well as in the other.

The theorems 1-26 are therefore capable of at least two interpretations: first, in the theory of classes, and secondly, in the theory of propositions; and there are doubtless many other theories also in which these formal statements can be given a concrete significance. It therefore becomes a natural inquiry to investigate this body of theorems in their abstract form (that is, without specifying any interpretation for the symbols), to study the logical relations that exist among them, and to select certain of them as fundamental, from which all the others can be deduced as formal consequences. The body of theorems so con-

sidered, with their consequences, forms a mathematical algebra, called (in distinction from the algebra of quantity, the algebra of complex numbers, the algebra of abstract groups, etc.) the *algebra of logic*. The algebra of logic bears the same relation to the ordinary algebra of quantity that the non-Euclidean geometries bear to the ordinary geometry of space; and it has been the analogy between the algebra of logic and the algebra of quantity that has led to the importation of several mathematical terms into the study of symbolic logic (as "zero," "sum," "product," etc.). The study of the algebra in this abstract form has brought out relations between the propositions of logic which might perhaps otherwise have remained unnoticed. As an example, it has been shown that the six fundamental notions: ∞ , o , x' , xy , $x+y$, $x \prec y$ are not independent of one another, but that all may be defined in terms of any one of the last three; thus, theorems 15, 16, 17, and 12 may be used as definitions of ∞ , o , x' , and $\prec$ in terms of $+$ and $\times$; while theorems 9 and 10 show how ab and $a+b$ can be defined in terms of $\prec$. Indeed it is hard to see how questions of the independence of the fundamental notions could have been discussed at all without the aid of the abstract algebraic method.—The most readable expositions of the algebra of logic from its mathematical side are given by Whitehead and Couturat (see bibliography). A searching inquiry into the nature of the algebra, and its relation to other branches of mathematics, was begun by Kempe in 1890, and has recently been carried farther by Royce (1905).

The Logic of Relations.—The Logic of Relations, or the Logic of Relatives, was founded, as regards first principles, by De Morgan ('Trans. Camb. Phil. Soc.,' vol. 10, 1864), developed by Peirce, carried further by Schröder, and has now met with what is possibly a farther important development in the hands of Russell (1903). We can give, in this space, only a cursory account of the principal terms which are employed.

In many inquiries we are concerned with the relation in which some term stands to some other term; for example, a number x may be less than a number y ; a person A may be a debtor of a person B ; a circle M may lie within another circle N ; the notions "less than," "debtor of," "within," are *relations*. Every relation has a *converse* relation. For example, if x is less than y , then y is greater than x ; if A is a debtor of B , then B is a creditor of A ; if M lies within N , then N includes M . It is customary to represent a relation by a capital letter, as R , and the inverse relation by the same letter with a curved dash above it, as $\bar{R}$. Thus, if R stands for "less than," and $x=3$ and $y=5$, we have: xRy and $y\bar{R}x$. Again, if R stands for "parent of," $\bar{R}$ will stand for "child of."

If xRy and ySz , then x stands in a certain relation to z , called the *relative product* of the relations R and S and denoted by RS . Thus if xRy stands for " x is brother of y ," and ySz for " y is father of z ," then $xRSz$ will signify " x is uncle of z "; or again, $xRSz$ may mean " x is an agent of a landlord of z "; etc.

If a relation R is such that xRy always im-

plies γRx , then R is called a *symmetrical* relation. For example, the relations "equal to," "different from," "spouse of," are symmetrical relations. If R is such that γRx is false whenever xRy is true, then R is called an *asymmetrical* relation; as "less than," "father of," etc. Relations like "sister of," which are neither symmetrical nor asymmetrical, are called simply not-symmetrical.

A relation R which is such that xRx for every value of x is called a *reflexive* relation, like the relation of equality, or the relation which we have denoted by $\prec$ in the preceding part of this article (see theorems 1 and 2).

Again, if a relation R is such that xRy and γRz together always imply xRz , then R is called a *transitive* relation. For example, "less than," "less than or equal to," "ancestor of," etc., are transitive relations. The asymmetrical transitive relations are more important than any other relations in the exact sciences; for example, "less than," "below," "before," "prior to," are relations of this type. The recent paper by Royce, however, shows how the theory of these asymmetrical relations can be made to depend on the theory of a certain more fundamental symmetrical relation.

In conclusion, we may notice that the whole theory of arithmetical operations, like addition and multiplication, may be regarded as a part of the theory of relations; for, as M. Bôcher has pointed out, instead of saying: "two numbers a and b determine a third number c , called their sum," we may say: "the three numbers a , b , and c satisfy a certain relation, say $R(a, b, c)$." Relations of this type are more complicated than those described above, since they hold not between two terms, but between three or more terms.

Bibliography.—The most extensive treatise on this subject is E. Schröder's 'Algebra der Logik,' in four volumes, begun in 1890; the last volume is being published posthumously by E. Müller. J. Venn's 'Symbolic Logic' (1881, 2d edition 1894) is especially valuable for its historical references. The forthcoming 'Manuel de Logistique,' by L. Couturat, may be expected to contain the clearest exposition of the whole subject, with an account of the most recent progress. A. N. Whitehead's 'Universal Algebra' (1898), and L. Couturat's 'L'Algèbre de la logique' (1905) treat the algebra of logic from the mathematical point of view. J. N. Keynes, in his 'Studies and Exercises in Formal Logic' (1894), has developed the subject without mathematical formulation, but in a very useful way for one who approaches it from the point of view of the logician. Other references are the following: 'Opusculs et fragments inédits de Leibniz,' ed. L. Couturat (1905); J. H. Lambert, 'Neues Organon' (1764); A. De Morgan, 'Formal Logic' (1847); G. Boole, 'Laws of Thought' (1854; see above); A. Macfarlane, 'Algebra of Logic' (1879); W. E. Johnson, 'Mind' (new series, vol. 1, 1892); H. McColl, 'Proc. Lond. Math. Soc.' (vol. 9, 1877), and later papers; C. S. Peirce, 'Amer. Journ. of Math.' (vols. 3, 4, 7), 'Proc. Amer. Acad. of Arts and Sci.' EDWARD V. HUNTINGTON,
Assistant Professor of Mathematics, Harvard
University; with the cooperation of

CHRISTINE LADD-FRANKLIN,
Lecturer at Johns Hopkins University.

Log'os (Greek λόγος, from λέγειν, to speak), word, language, speech in general. Language being peculiar to man as a reasonable being, and speech presupposing thought, *logos* signifies reason, the faculty of thinking in general. Thus *logos* has the meaning both of thought and utterance. In Christian theology this term, as used in certain passages of the Scriptures, has been the source of continual disputes ever since the 3d century of our era. The passage in the Bible which gives rise to this discussion is the opening of the Gospel of St. John: 'In the beginning was the Word, and the Word was with God, and the Word was God. The same was in the beginning with God. All things were made by him, and without him was not anything made that was made,' etc. In the Greek text the expression here translated "Word" is *logos*. What is here to be understood by *logos*, what is its essential character, whether it is a person of the Deity or not, the creative intellect of God, or the Son, through whom he created, or the divine truth which was to be revealed, etc., this is not the proper place to examine, nor will our limits permit us even to enumerate the different opinions which have been entertained on this interesting point of Christian metaphysics. We can refer the reader to no better source of information than Neander's 'General History of Christianity and the Church.' The generally received doctrine of the *logos* makes it a person and not a mere name, and maintains that the Word is called *God*, not by catachresis, but in the strict and rigorous meaning of the term; that the most ancient Fathers of the Church always taught the divinity of the Word, and that they derived the idea from the Holy Scriptures alone, and not from the Platonic philosophy as many have asserted. On the contrary, it is held that the Hebrew conception of the *logos* is of independent origin, though it was natural that in the New Testament the Greek word should be adopted to express it. Some of the opinions of modern theologians on the meaning of the *logos* are as follows: It is necessary, some say, in order to understand the true meaning of *logos*, to begin with the examination of Wisdom (*sophia*), which was previously used to express the same notion. (See the Book of Proverbs, viii. 1, seq., and the Book of Wisdom, vii. 22, seq.) The poetical author of the Proverbs does not imagine a person separate from God, but only an interior power of God, because in his time there could be no idea of a being proceeding from God, the Jews having borrowed this notion at a later period from the oriental doctrine of emanations. The author of the Book of Sirach (xxiv. 3) first uses 'The Word' (*logos*)

of God as equivalent to "Wisdom" (*sophia*), to signify the almighty power of God. The Word being an act of wisdom gave rise to the symbol. John speaks of the *logos* in the beginning of his Gospel only, and afterward uses the expression *pneuma tou theou*. From his representation, the following positions have been deduced: the *logos* was (a) from the beginning of all things (comp. Proverbs viii. 22; Sirach xxiv. 9); (b) from the beginning with God (comp. Sir. i. 1; Wisd. Sol. x. 16; ii. 14; Sir. xxiv. 12). St. John, therefore, says those who thus interpret him, had the same idea of the *logos* as the apocryphal writers; for the circumstance that the latter ascribe to the *logos* the creation of all things, while St. John leaves this point undecided in his *en archē en* (in the beginning was), does not amount to a contradiction. Others, particularly the earlier commentators, understand by *logos* the Deity himself, that is, the second person of the Deity (according to St. John viii. 58). But those who adhere to the former opinion maintain that this is in contradiction to John xiv. 28; xii. 49, 50; v. 19, 20; and that he understood by *logos* only a power of God, which was communicated to Jesus, on account of which he could claim divine attributes and yet call the Father, as the source of this power, greater than himself. Others, as Herder, Paulus, Eckermann, understand by *logos* the Word of God, which, in the Old Testament, as the expression of the will of God, is the symbol of his creative power (Gen. i, et seq.). The later Jews represented the divine omnipotence by the Word of God. But it is maintained, on the other hand, from the manner in which John speaks of the *logos*, that he understood by it not merely omnipotence, but the Omnipotent. Others following the Fathers of the Church, particularly Eusebius, understand by *logos* an independent substance, external from God, like the *nous* (intellect) of Plato. But this again, it is said, involves an error, because Plato means by *nous* only a power of God. Still others, as Mosheim, Schlegel, Jerusalem, declare with Irenæus the *logos* of St. John to be identical with the *logos* of the Gnostics; but it is objected that John did not conceive of a plurality like that in the doctrine of æons. Lange considered *logos* equivalent to the *sophia* of the Old Testament, and that to the *logos* of Philo, and as a distinct person from God; but, say the others, *sophia* is not something distinct from God. Paulus, in his Commentary, also identifies the *logos* of Philo with that of St. John. But it is said, on the other hand, that John cannot be supposed to have been acquainted with Philo's notion, as it was not an opinion current at the time, and that the view of the apocryphal writers is more in harmony with his; moreover, that if St. John means anything more than an original, external power in God, his "was God" (St. John i. 1) would imply dualism. Döderlein and Storr translated the word *logos* by *doctrina*, the abstract being put for the concrete, *doctrine* for *teacher*, as in Gen. xlii. 38; 2 Sam. xxii. 23; Luke iv. 36. According to others, *ho logos* means *ho legomenos* (the promised). The ancient philosophers often distinguish two *logoi* an interior in God or man which merely thinks (*logos endiathetos*), and an exterior or uttered (*logos prophorikos*).

Log'wood, the heart-wood of the *Hamatoxylon Campechianum*, a leguminous tree which

grows wild, in moist places, along the eastern shores of Mexico and Central America. From its abundance in some parts near the Bay of Campeachy it is sometimes called *Campeachy-wood*. The leaves are pinnate; the flowers small, yellowish, and disposed in axillary racemes at the extremity of the usually spinous branches. The wood is red, tinged with orange and black, so heavy as to sink in water, and susceptible of receiving a good polish; and it yields an extract much used in dyeing. (See DYES.) Though cultivated to some extent in Jamaica, the logwood of commerce is chiefly obtained from Honduras, where the cutting of it forms an extensive but unhealthy branch of business. Haiti and San Domingo also produce much. The finest kind comes from Campeachy, the inferior qualities from Honduras and Jamaica, to which island it is not indigenous, but where it grows abundantly since its introduction. In the preparation of this wood for use, the trees, which are from 20 to 50 feet high, are cut down, the bark and alburnum removed, and the hard centre parts cut up into 3-foot-long logs. It is afterward hewn into much smaller pieces, and ground or rasped to small chips. The aqueous extract is muddy and of a reddish-brown color. By acids the red color is made paler; by alkalis it is converted to purple. Salts of iron, aluminum, and lead give precipitates of a blue, violet, or purple color. Logwood is chiefly consumed in dyeing cotton cloth, silk, wool, and leather; by mordanting the fabric with iron, black is produced; with alumina, violet and lilac; with copper, blue; and with chromium, a black or green—the exact tint depending on the composition of the mordants and logwood liquors, and the mode of application. The coloring power of logwood depends chiefly on a crystalline ingredient called *hamatoxylum* (q.v.). In medicine both the extract and the decoction of logwood are used to some extent. The former is prepared by exhausting the wood with boiling water, filtering, and evaporating to a thickish syrup; the latter is the watery extract of the wood along with some cinnamon. Both are used as astringents in diarrhoea and dysentery.

Lohengrin, lō'ēn-grīn, the hero of an old German poem, written in the end of the 13th century. Rückert's edition (1857) of the poem is the best. The poem is a continuation of Wolfram von Eschenbach's 'Parzival.' Wagner made it the subject of his great opera, 'Lohengrin' (1848).

Loire, lwâr (anc. *Liger*), France, the largest river of the country, dividing it into two nearly equal portions. It rises on the western slope of the Cévennes, in the department of Ardèche, and flows generally northwest and west to its outlet in the Bay of Biscay below Nantes. Its principal affluents on the right are the Arroux, Nièvre, Maine, etc.; on the left the Allier, Vienne, Cher, Indre, etc. Below Nantes, it is more a tidal estuary than a river, and is studded with islets. Above Nantes navigation is much impeded by shallows. Its whole course is about 645 miles, of which about 450 miles are navigable. The river is subject to disastrous inundations, and dikes (levées) have been constructed along its course. It is connected by canals with the Saône, Seine, and Vilaine.

Loki, lō'ke, in mythology, the god of strife and spirit of evil. He artfully contrived the

death of Balder, when Odin had forbidden everything that springs "from fire, air, earth, and water" to injure him. The mistletoe not being included, was made into an arrow, given to the blind Höder, and shot at random; but it struck the beautiful Balder and killed him. This evil being was subsequently chained with 10 chains, and will so continue till the twilight of the gods appears, when he will break his bonds; then will the heavens disappear, the earth be swallowed up by the sea, fire shall consume the elements, and even Odin, with all his kindred deities, shall perish.

Lokman, lók-mán', a name that figures in the proverbs and traditions of the Arabians. According to tradition Lokman was a scion from the stock of Ad, and was once sent with a caravan from Ethiopia to Mecca to pray for rain in a time of great drought. But God's anger destroyed the whole family of Ad except Lokman, the only righteous one, whereupon the Creator of the world gave him his choice to live as long as the dung of seven gazelles, which lay in an inaccessible hole in a mountain, should last, or for a period equal to the lives of seven successive vultures. Lokman chose the last, and lived for an almost incalculable length of time. The fables bearing the name of Lokman were for the first time made known to Europe through the press in 1615. They were first published in Arabic, with a Latin translation, were afterward appended to an Arabic grammar, published by Erpenius at Leyden, and have since gone through many editions. The most complete manuscript of the fables of Lokman is in the library of the Vatican, in Persian.

Lola Montez. See MONTEZ, LOLA.

Lolach. See LEPIDOSIREN.

Lollardism, löl'ar-dizm, in Great Britain, the tenets of the followers of John Wyclif. The views of Wyclif underwent a process of development as his researches and experience extended, and were by no means the same at all periods of his life. In so far as they departed from Roman Catholicism, they approached and, in some cases, went beyond what subsequently became the doctrine and discipline of Calvinism or Puritanism, commingled with an antagonistic element, Erastianism. Among the articles pronounced "heretical" by an assembly of ecclesiastical notables, convened in London in 1382 by Wm. Courtnay, archbishop of Canterbury, were these:

"1. That the substance of material bread and wine doth remain in the Sacrament of the Altar after consecration.

"3. That Christ is not in the Sacrament of the Altar truly and really in His proper corporeal person.

"5. That if a man be only contrite, all exterior confession is to him superfluous and invalid.

"7. That it hath no foundation in the Gospel that Christ did ordain the mass.

"8. That if the Pope be a reprobate and an evil man, and consequently a member of the devil, he hath no power over the faithful of Christ given to him by any, unless, peradventure, it be given him by the emperor.

"9. That after Urban VI. none other is to be received as Pope, but that Christendom ought to live after the manner of the Greeks under its own laws.

"10. That it is against the sacred Scriptures that ecclesiastical persons should have any temporal position."

Among 14 articles adjudged to be "erroneous" were the following:

"13. That a prelate or bishop excommunicating a cleric who hath appealed to the king or the council of

the realm, in doing so is a traitor to the king and the realm.

"15. That it is lawful for any deacon or presbyter to preach the Word of God, without the authority or license of the Apostolic See, or of a Catholic bishop or of any other recognized authority.

"17. Also that temporal lords may at will take away their temporal goods from churches habitually delinquent.

"18. That tithes are pure alms, and that parishioners may for the offenses of their curates detain them, and bestow them on others at pleasure, and that tenants may correct delinquent landlords at will.

"24. That friars are bound to get their living by the labor of their hands, and not by begging.

See also DOLLARDS.

Lollards, löl'ardz, a name which arose in the Netherlands in the 14th century, and which during that and the following century was applied somewhat indiscriminately as a term of contempt to various sects or fraternities deemed heretical by the Roman Catholic Church. Different accounts are given of the derivation of the name. According to one opinion the name was first applied to a fraternity formed about the year 1300 at Antwerp, the members of which devoted themselves to the care of the sick and the burial of the dead, and were called Lollards from the Low German *lollen* or *lullen*, meaning to sing in a low tone, from the subdued and plaintive dirges that they were in the practice of singing while accompanying dead bodies to the grave. According to another opinion the name was first bestowed upon the followers of one Walter Lollard, who preached peculiar doctrines both in England and on the Continent between 1315 and 1322, till in the latter year he was burned as a heretic. Whatever may have been the origin of the name, it became well known in England about the end of the 14th century, when it was applied to the followers of Wyclif. See LOLLARDISM.

Lolos, löl'lož, an aboriginal fair-complexioned people of China, inhabiting the Ta-liang-shan mountainous country, lying between the Yangtse River on the east and the Kien ch'ang valley on the southwest in Sze-chuen, and also found scattered on the Burmese and Tibetan frontiers. They are divided into tribes governed by hereditary chieftains, and maintain an independent position, frequently warring on their peaceable Chinese neighbors, and making slaves of them. They are descendants of aborigines who were driven southward by the immigration and increase of the Chinese.

Lomami, lō-mä'mē, Kongo Free State, a navigable river of Central Africa which rises near Kazaidi (Msoa), and after flowing almost parallel with the upper course of the Kongo River, enters the latter at Isangui several miles below Stanley Falls.

Lom'ax, Lindsay Lunsford, American soldier: b. Newport, R. I., 4 Nov. 1835. He was graduated from the United States Military Academy in 1856, entered the 2d cavalry, but later resigned from the United States army, became a captain in the Virginia State troops, and 29 April 1861 was made captain in the army of the Confederate States and assistant adjutant-general to General J. E. Johnston. In February 1863 he was appointed colonel of the 11th Virginia cavalry, in July 1863 brigadier-general, and in August 1864 major-general. He commanded a brigade under Fitzhugh Lee, a division under Early, and 1865 was made commander of the valley district. He took part in

all the battles in which his portion of the Army of Northern Virginia fought, and surrendered with Johnston at Greensboro, N. C. After the War he was employed in the war records office at Washington, D. C.

Lombard, lŏm'bard, **Peter**, also known under his Latinized name, **PETRUS LOMBARDUS**, Italian theologian: b. Lugelogno, near Novara, Lombardy, about 1100; d. Paris 20 July 1164. He was a scholar of Abelard, and traditionally the first doctor of the University of Paris. He then became a teacher of theology, and in 1159, bishop of Paris. In his 'Sententiarum Libri Quatuor,' which became the subject of almost countless commentaries, and until the Reformation had almost classical authority among theologians, he placed the opinions of the Fathers, particularly Augustine, in regard to doctrines under certain titles, and then stated the objections made to them and the answers given by church authorities, but without offering any judgment of his own. The name of his work has given him the surname of Master of Sentences. Consult 'Life' by Protois (1881).

Lombard Architecture. See **ARCHITECTURE**.

Lombard College, a coeducational institution founded, in 1851, in Galesburg, Ill., under the auspices of the Universalists. In 1903 there were connected with the school 24 instructors and 204 students. The library contains about 8,000 volumes. It has a preparatory department and a classical department. The degree A. B. is conferred on those completing the classical course.

Lombard Street, a short street in London, which received its name from having been the residence of the Lombards, the money-lenders of former times, whose usurious transactions caused their expulsion from the kingdom in the reign of Elizabeth. It is now chiefly occupied by bankers, and is a place of much importance in the London commercial world. It is the English equivalent of Wall Street.

Lombards, Longobardi, or Langobardi, a Germanic or Teutonic people who at the beginning of the Christian era were dwelling on the lower Elbe. They make little appearance in history till the 6th century, when, under their king Alboin, they entered Italy in April 568, and, with the help of Saxons and others, conquered the northern portion, which hence received the name of Lombardy. From 713 to 744 the Lombards had a powerful king in the person of Liutprant, who extended his sway, at least temporarily, over the whole of Italy. From that time the power of the Lombards gradually declined, and finally Charlemagne captured Pavia after a six months' siege, and put an end to the Lombard kingdom (773 or 774), the last monarch being Desiderius.

Lombardy, lŏm'bar-dĭ, Italy, an ancient kingdom, now a northern compartimento embracing the eight provinces of Bergamo, Brescia, Como, Cremona, Mantua, Milan, Pavia, and Sondrio, with an aggregate area of 9,297 square miles and a population in 1901 of 4,282,728, or 460.66 to the square mile. It comprises that portion of Upper Italy which took its name from the Longobardi or Lombards. (See **LOMBARDS**.) After the fall of the Lombard kingdom this territory remained attached to the empire of Charlemagne and his successors till

843, when an independent kingdom of Italy arose, out of which in process of time a number of independent duchies and marquisates (Friuli, Mantua, Susa, etc.) or republics (Venice, Genoa, Milan, etc.) were formed. When Austria acquired the duchies of Mantua and Milan these provinces were called Austrian Lombardy, a name which they retained till Napoleon formed in 1797 out of them and other districts the Cisalpine, afterward the Italian Republic, and at last, in 1805, the kingdom of Italy. By the Peace of Paris, 1814, and the act of the Congress of Vienna, 1815, Austria received back its old Lombard possessions; but in consequence of the war of 1859 was compelled to cede them to Victor Emmanuel, king of Sardinia, by the Peace of Zürich, and in the following year they became part of the kingdom of Italy.

Lombok, East Indian Archipelago, one of the Lesser Sunda islands, east of Java, between Bali on the west and Sumbawa on the east. Area 3,136 square miles. The island is mountainous and of volcanic origin. Between the two ranges which traverse the island, one of them rising to the height of 11,800 feet, there is a plain fertile in rice, cotton, maize, coffee, and tobacco. The upper and former ruling class are Brahmans, and the mass of the people, Mohammedans. The capital, Mataram on the west coast, was bombarded in 1894 by a Dutch expedition, since when the island is administered by a Dutch resident. Pop. 370,000.

Lombroso, Cesare, chă'ză-rě lŏm-brŏ'zŏ, Italian scientist: b. Verona 1836. In 1862 he became professor of psychiatry at Pavia, and later of medical jurisprudence and psychiatry at Turin. He became widely known through his investigations of the abnormal human being, and through his theories deduced therefrom; theories which encountered great opposition and are not yet entirely accepted, but which formed in part the basis for the present criminal anthropology. He published numerous works, such as: 'The Criminal' (1887-95); 'The Man of Genius' (1890; Eng. trans. 1891); 'The Anarchists' (1895); 'The Causes of, and Contest against, Crime' (1902). Consult the study by Kurella (1892).

Lomond, Loch, lŏh lŏ-mŏnd, Scotland, a beautiful lake in the counties of Stirling and Dumbarton. Its length is about 24 miles; the breadth at the lower or southern end, 7 miles, at the upper end less than half a mile. For 14 miles from the head the breadth does not exceed 1½ miles. The lake is almost entirely surrounded with ranges of hills; and its surface is studded with numerous islands. The principal hills are on the eastern side, where a branch of the Grampians culminates in Ben Lomond, 3,192 feet high, on the very border of the lake. Through the glens intersecting the surrounding hills, the drainage of the district flows into the lake by the Falloch, Endrick, Fruin, Luss, and other streams; and the river Leven at the southwestern extremity conveys the overflow to the Clyde. The greatest depth is in the narrower part of the lake, where in some parts it reaches 600 feet. Fish, including salmon, salmon-trout, pike, perch, eels, and pawns, usually called fresh-water herrings, are abundant. Steamboats in connection with the North British and the Caledonian Railway ply on the loch.

LONDON

London, Jack, American author: b. San Francisco, Cal., 12 Jan. 1876. He was educated at the University of California, which he left to go to the Klondike region, and in 1892 went to sea before the mast. He has tramped throughout Canada and the United States for sociological study, and spent some time in seal fishing in 1893. He has published: 'The Son of the Wolf: Tales of the Far North' (1900); 'The God of his Fathers' (1901); 'A Daughter of the Snows' (1902); 'The Children of the Frost' (1902); 'The Cruise of the Dazzler' (1902); 'The People of the Abyss' (1903); 'Kempton-Wace Letters' (1903); 'The Call of the Wild' (1903); 'The Faith of Men' (1904); 'The Sea Wolf' (1904); 'The Game' (1905); 'War of the Classes' (1905); 'Tales of the Fish Patrol' (1905); etc.

London, England, the largest city in the world, the capital of the United Kingdom of Great Britain and Ireland, and of the British Empire, situated on both banks of the Thames River, about 40 miles from its mouth, the latitude and longitude of Saint Paul's Cathedral being respectively 51° 30' 48" N. and 0° 5' 48" W. Modern London consists of the city of London as the nucleus, and the occupied surrounding parts of about 120 square miles taken from the counties of Middlesex, Surrey, and Kent. In 1855 the Metropolis Management Act was passed, defining for sanitary purposes, outside the nucleate city of London with 673 acres, 85 parishes, the whole, including the city, covering an area of 75,379 acres, 31,422 acres being the county of Middlesex, 23,893 acres in Surrey, and 20,064 acres in Kent. By the Local Government Act of 1888 this area was constituted the administrative county of London. In 1899, by the London Government Act of that year, the boundaries of the county were slightly altered, and the whole, with the exception of the city of London, was divided into 28 metropolitan boroughs, including the city of Westminster. The area of the administrative county is now 74,817 acres, including 31,652 acres formerly in Middlesex, 23,101 formerly in Surrey, and 20,064 formerly in Kent. See **LONDON CITIES AND BOROUGHS**.

The name London is therefore legally and properly applicable to the entire area within the county boundaries. But outside the county limits the urban aggregation extends, with numerous large and connected towns, to 15 miles around Charing Cross. These are embraced in the boundaries of the metropolitan and city police districts and constitute Greater London, bringing the total area to 443,419 acres with a population (1891) 5,633,806, (1901) 6,581,402, and in certain directions, notably in Essex this area of occupation is still extending.

Climate.—London is one of the healthiest of the large cities of Europe. The death rate per 1,000 living in 1841-50 was 24.8; 1851-60, 23.7; 1861-70, 24.4; 1871-80, 22.5; 1881-90, 20.5; 1891-1900, 19.1. The death rate for 1904 was 16.1 (or, including the deaths of Londoners in the metropolitan workhouses, hospitals, and lunatic asylums outside the county, 16.6), considerably lower than the rate (18.19) for all England and Wales. The mean annual temperature is about 50° and the general range of the thermometer is from 20° to 81°; the highest

* Since 1901 an alteration of the county boundary has reduced the area of the borough of Wandsworth and of the county by 22 acres.

and lowest markings being, for the most part, in August and January respectively. The figures for 1904 were: average air temperature 49°.8; maximum (4 August) 91°; minimum (31 December) 17°.1 The prevailing wind is the southwest, and there are few places in the kingdom where less rain falls. In the beginning of winter London is occasionally enveloped in fogs, which are especially dense in the lower parts, and greatly aggravated by the perpetual pall of smoke-laden air overhanging the metropolis. This pall is occasioned by the general domestic and industrial use of bituminous coal. Even when this smoke-cloud does not take the unpleasant form of fogs it keeps the sunshine away to quite a considerable extent, in winter robbing London of fully half the sunshine it ought to enjoy, and giving to the metropolis that general gloom and begrimed aspect of buildings which are so depressing to visitors.

General Aspect, River, Bridges, Main Thoroughfares, etc.—London stands on alluvial deposits consisting of beds of clay and gravel, below which is the hard clay stratum known to geologists by the name of the "London clay," in the middle of the great chalk basin extending from Berkshire to the east coast. On the north bank of the Thames, where the principal part of London stands, the site rises gradually at the rate of 36 feet per mile, while on the opposite bank the houses cover a nearly uniform and extensive flat, lying in some places several feet below the highest tides. Within the limits of London the Thames varies considerably in width. At Putney it is 550 feet, at Battersea 960, at Vauxhall 630, at Westminster 275 feet,

LONDON

at Waterloo 1,140 feet, while at Blackfriars it narrows down to 830 feet. At London Bridge, it is 800 feet wide, and at Woolwich 1,470 feet wide. The bridge farthest down the river is Tower Bridge, just below the Tower of London—a bascule bridge, which allows the passage of large vessels. London Bridge connects the city at King William Street with Southwark at the junction of Wellington Street and Tooley Street. About 500 yards further up the river stands Southwark Bridge, connecting the city and Southwark. About half a mile further west Blackfriars Bridge connects the city at Bridge Street with Southwark at Blackfriars road. Waterloo Bridge, nearly half a mile above the former, is a granite structure of 9 elliptical spans, and is 1,240 feet long between the abutments. It is perfectly level, and connects the Strand with the Waterloo road. Westminster Bridge crosses the river at the north end of the Houses of Parliament from Westminster to Lambeth. Further up the river Westminster and Lambeth are again connected by Lambeth and Vauxhall bridges. The Chelsea Suspension bridge connects Chelsea and Pimlico on the north side with Battersea to the west of Battersea Park; and the Battersea Bridge unites Chelsea and Battersea a little further west. Putney Bridge, a magnificent structure of granite, connects Fulham and Putney; and Hammersmith Bridge, the last in London, connects Hammersmith with Barnes. There are also six railway bridges across the Thames. One of them, at Charing Cross, displaced the old Hungerford Suspension Bridge, but is provided with a footway on one side. The two railway bridges at Pimlico, which look like one, belong to the London, Brighton, and South Coast Railway Company, and the London, Chatham, and Dover. The latter company owns a bridge close to Blackfriars Bridge. The new bridge at Vauxhall is said to be as notable a combination of art and utility as the famous Alexander III. bridge in Paris. The once famous Thames tunnel, two miles below London Bridge, opened in 1843 as a roadway under the river, now serves as a railway tunnel. A subway under the river, lined with iron hoops, connects Tower Hill and Tooley Street, Southwark, but is not opened to the public; and there is a great tunnel for foot-passengers and vehicles between Blackwell and East Greenwich and one for foot-passengers only between the Isle of Dogs and Greenwich. A tunnel for both vehicular and pedestrian traffic is in course of construction between Shadwell and Rotherhithe. Three underground electric railways pass under the river. There is a free steamboat ferry between North and South Woolwich.

Since the passing of the Metropolis Management Act of 1855 great changes have been made in the condition of London. The gigantic operations connected with the sewerage of London and the embankment of the Thames, from Blackfriars to Chelsea on the north side, and from Westminster Bridge to Vauxhall on the south, have produced great changes, while important lines of streets have opened up districts formerly almost inaccessible. These operations have also absorbed the former little rivers and rills, leaving only a corner, an alley, or a street—for example, Fleet Street—with their name for a

monument. Further extensive main drainage works are being carried on which are estimated to cost £4,000,000, and extensive street improvements, sanctioned by Parliament, are in progress. In all the districts of London, and particularly in the City and West End, there has latterly been great improvement in the quality of architectural decoration and in public buildings, and stone has to a considerable extent replaced brick and plaster, though not so far as to change the aspect of some localities. Though some of the leading streets are wide, others are narrow and irregular. The decorative character of the streets about Lombard Street, and the Mansion House in the City, has been fostered by the growth of numerous banking and insurance companies, while the new office and store buildings in various quarters, especially the one opposite St. Mary-le-Strand, the hotels and apartment houses on the American steel structure plan, have added an entirely new style of brick architecture.

"The City"—the historic centre of London—is bounded south by the Thames; it extends north to Charterhouse Square, east to Middlesex Street, and west to the New Law Courts. Till 1878 this last boundary was marked by Temple Bar, an old gateway crossing Fleet Street near the Temple; but in that year this structure was removed, and a memorial was erected on the site. The portion of the City inside the area of the former mediæval walls is known as "London within the walls"; and all the wards are bounded by the site of the old walls; the portion outside extends irregularly all around and is known as "London without the walls."

Of the streets that run through modern London the most important from west to east is that which enters from Kew into Hammersmith, and passing through Kensington, forms the finest of all the approaches to London. It stretches on through Brompton, Knightsbridge, and Piccadilly, past fashionable Belgravia, with Kensington Gardens, Hyde Park, and Paddington on the north, and with Apsley House and numerous other palatial edifices facing the Green Park, which constitutes its south boundary for about half the length of Piccadilly. This line is broken at the east end of Piccadilly, but passes by Regent Street (or by the Haymarket) and Trafalgar Square into the Strand, which continues it farther east and much nearer the river, and it stretches on past the Temple, along Fleet Street, Ludgate Hill, St. Paul's Churchyard, where it runs into Cannon Street, leading to the Tower on one side, and on the other into Cheapside, Poultry, Lombard Street, Fenchurch Street, Aldgate, and by Whitechapel road, and Mile-end road through the congested poorer districts to the county boundary at Bow. The next great artery between the west and east extends along the Uxbridge road from Acton, entering the county boundary at Shepherd's Bush and passing through Notting Hill, along Oxford Street, through Holborn and Newgate Street, where it joins the more south line above described, at the west end of Cheapside. Farther north is a third line, extending from near Kensington Gardens, through Oxford and Cambridge Terrace along the Marylebone, Euston, Pentonville road, to Islington, and thence by the City road

LONDON

to Finsbury Square. Among the leading thoroughfares running north and south the extreme west is Edgeware road, which enters the county at Kilburn, terminating at its south extremity in Oxford Street, from which it runs northwest, but communicating through Park lane with Piccadilly, a little to the west of which, from Hyde Park Corner Place, Grosvenor Place leads down to Buckingham Palace road, from which Vauxhall road forms a connecting line with the river. Park lane and Grosvenor Place on this line contain many of the most select residences of the aristocracy. East of the Edgeware road Regent Street with Portland Place, Tottenham Court road with Charing Cross road, and other connecting lines leading to Westminster, Pimlico, and Chelsea, Gray's Inn road, and the line of Chancery lane, Farringdon Street, etc., leading to Fleet Street and Blackfriars Bridge, form some of the most important communications in this direction. Piccadilly and Pall Mall, running east and west, Bond Street, Regent Street, and St. James' Street, north and south, are among the most fashionable streets in the West End, each with its own distinctive character. Bond Street contains the shops most patronized by the aristocracy; Regent Street, according to some tastes the handsomest street in London, is the fashionable promenade and has some of the finest shops. It unites by Portland Place in the north with Regent's Park and Primrose Hill Park, and intersects Oxford Street and Piccadilly, and reaches south to Waterloo Place, by which it communicates with St. James' Park. The greatest and most picturesque thoroughfare in London, not of an exclusive mercantile character, is the line of the Strand and Fleet Street.

The Thames Embankments belong to the modern features of London. The Victoria Embankment on the north side consists of a wide roadway, with a granite retaining wall, surmounted by a parapet broken by pedestals for lamps. There are well contrived landing-stages and recesses, these features of the Embankment being rendered highly ornamental by balustrades, pedestals for sculpture, etc. From the Temple to Charing Cross portions of land reclaimed from the Thames have been laid out in public gardens. The Chelsea Embankment extends from the Albert Suspension Bridge eastward past Chelsea Hospital. From the fine building of St. Thomas' Hospital next Westminster Bridge, on the south side of the river, extends the Albert Embankment, continuous with the old quay at Lambeth. A very valuable improvement in the City was the Holborn Valley Viaduct, extending from Newgate Street to the end of Hatton Garden. Broad roads also lead to the Central Meat Market, and to the lower level of Farringdon Street, which is crossed by the viaduct obliquely, with three Gothic arches supported on 12 hexagonal columns of polished red granite. The estimated length of streets in London is over 2,000 miles.

Public Buildings in the City.—A number of the most important buildings are situated within the ancient city. The nucleus of the whole is formed by the Bank of England, the Royal Exchange, and the Mansion House, which all face toward an open area; the centre of bustle and business, near the middle of the city, adorned

with the handsome offices of several assurance companies. The Bank of England, in Threadneedle Street, was built in 1732-4 and now forms a low flat, insulated, irregular parallelogram covering four acres of ground. The Royal Exchange is an extensive and ornate building, having a portico surmounted by a pediment enriched by sculpture. It surrounds an open interior quadrangle, in the centre of which is a marble statue of Queen Victoria. In this court, which is surrounded by covered arcades, the meetings of the merchants on Change are held. An equestrian statue by Chantrey of the Duke of Wellington occupies the area in front of the building. The Royal Exchange, originally founded by Sir Thomas Gresham in 1566, was burned down in 1666, rebuilt, and again burned down in 1838, the present edifice being erected on its site. The exchanges for special purposes are: The Stock Exchange in Capel Court; the Coal Exchange, Lower Thames Street, a sumptuous though rather incongruous building, the great hall of which is circular, 60 feet in diameter, and 74 feet to the apex of the glazed dome; the Corn Exchange, in Mark Lane, opened in 1747, enlarged and partly rebuilt in 1827, and now again almost entirely rebuilt. The Mansion House, the official residence of the lord-mayor, was built in 1739-53. The Guildhall, at the north end of King Street, Cheapside, is where the principal business of the corporation of the city of London is conducted. The civic banquets are given here. A splendid new council chamber was completed in 1885. The hall itself is now covered with a decorative open timber roof of the Perpendicular Gothic style; the old front has been replaced by a new Gothic front. The hall is capable of seating 3,000 persons, and contains some monuments of ordinary sculpture; and at the west end, raised on pedestals, are colossal figures of Gog and Magog. In 1872 a handsome suite of rooms was added to the Guildhall for the Corporation Library and Museum. The library consists of upward of 40,000 volumes. Of late years some of the city companies have remodeled or rebuilt their halls. Of these the Clothworkers' Company have produced the most elaborate street façade, but its confined situation in Mincing Lane does not permit it to be seen to advantage. The Goldsmiths' Hall behind the post-office; the Fishmongers' Hall near London Bridge; and the Ironmongers' Hall, in Fenchurch Street, are the principal structures. In the city many old and familiar landmarks have been removed. The once famous East India House in Leadenhall Street, and the Excise Office in Broad Street, have been replaced by immense piles of offices; Doctors' Commons has been cleared away for the new street to the Mansion House; Sir C. Wren's College of Physicians is supplanted by meaner buildings; the site of the Steel-yard, memorable in the history of old London, is absorbed by the city terminus of the South Eastern railway; old churches have been leveled, and old inns, hostleries, and streets, replete with great historic and literary associations, have disappeared; while outside the city a whole region full of good and bad memories has been cleared away for the new Law Courts; the Statepaper Office is displaced by the Foreign Office; Tattersall's is

LONDON

crossed by streets; chambers occupy the ground of the Old Thatched House; and a gymnasium has supplanted the British Institution.

The Tower.—This celebrated fortress, which formed the dominating feature of Norman London, stands on the north bank of the Thames, immediately adjoining the boundary of the city. Besides its use as a fortress the Tower was the temporary residence of several kings and queens of England, but is now only used as a storage for armor and as headquarters for certain military matters. It occupies an area of 12 acres, enclosed within a wall surrounded by a ditch, now dry, and laid out as a garden. On the south side is an archway called the "Traitors' Gate," through which state prisoners were brought from the river. The whole region of the Tower abounds with reminiscences of English history, conjured up by such names as Raleigh, Algernon Sidney, Anne Boleyn, Catherine Howard, etc. The most ancient part is the keep, now known as the White Tower, which was erected about 1078 for William the Conqueror by Fundulph, bishop of Rochester. It stands near the centre of the quadrangle, around which are placed several other towers, each having its distinctive name. The Tower contains the Wellington Barracks, erected on the site of the grand storehouse, burned down in 1841; the jewel room, a modern edifice, in which are preserved the regalia of Great Britain; the horse armory, Queen Elizabeth's armory, and the Church of St. Peter-ad-Vincula.

Church Buildings.—Saint Paul's Cathedral stands on the summit of Ludgate Hill, on a site which was formerly used for pagan worship, and has been occupied by a church from early Saxon times. Old Saint Paul's, a vast Gothic building, was destroyed by the great fire of 1666, and only a few columns of the chapter house now remain to view. The present church, on the same site, the greatest and most conspicuous architectural ornament of London, planned and carried out by Sir Christopher Wren, was begun in 1675, and completed in 1710. It is 510 feet in length from east to west, while the transept is 250 feet long, exclusive of the semi-circular portico at each end; the breadth of the west front is 180 feet, and the height of the walls 110 feet. The building is crowned with an immense dome, surmounted by a lantern with ball and cross, the height of the latter being 404 feet from the ground. It is built of Portland stone, and cost £747,954, which was paid by levying a tax on coal. The interior has been decorated at great cost by voluntary means, according to the original intentions of Wren. Among the monuments it contains are those of Wellington, Nelson, Sir Ralph Abercromby, Sir John Moore, Dr. Johnson, Howard, Sir Joshua Reynolds, and eminent men of more modern times. Near together, under the centre of the dome, lie interred Lord Nelson and the Duke of Wellington. Westminster Abbey, one of the finest specimens of the Pointed style in Great Britain, dates from the reign of Henry III., and Edward I., when it was erected on the site of the Saxon minster founded by Sebert. The beautiful chapel at the east end was added by Henry VII., and at the beginning of the 18th century the upper parts of the two towers at the west end were erected from designs of Sir

Christopher Wren. It is 360 feet long, and 195 feet wide, within the walls. Here kings and queens have been crowned, from Edward the Confessor to Edward VII., and here many of them are buried, some with and others without monuments. In the south transept are the tombs and honorary monuments of great poets, from Chaucer down to Tennyson, whence it is called "Poets' Corner," and in other parts are numerous sculptured monuments to statesmen, warriors, philosophers, divines, patriots, and eminent individuals generally, many of whom are interred within its walls. Of the other sacred edifices in London the most remarkable are: Saint Bartholomew's in West Smithfield, which consists of the chancel and lady-chapel only of the original church, and contains some beautiful specimens of Norman, Early English, and later styles of architecture; Saint Saviour's in Southwark, now a cathedral, boasts of the best Early English architecture in London in its choir and lady-chapel, the principal portions of the old church which remain; Saint Giles, Cripplegate, a beautiful pre-Reformation church; Saint Stephen's, Walbrook, the interior of which is extremely fine and generally regarded as one of Wren's best works; and the Temple Church, which is one of the very few round churches now remaining in England, and combines transition Norman architecture with Early English, the latter in the choir, which was founded in 1240. Besides these there are very few of the older churches left, among the most interesting of which is Bow Church. Of the remainder, Wren's churches are very beautiful, and perhaps Saint Bride's in Fleet Street, and Saint Martin's-in-the-Fields, may also be specified. During the Georgian period hideous specimens of architecture were erected, and these still predominate. Among Roman Catholic churches in London are Saint George's Cathedral, in Southwark, finished in 1848, and the magnificent new cathedral of Byzantine architecture at Westminster, with an imposing campanile 300 feet high. The largest arch over any known church doorway admits 10,000 worshippers to ample accommodation under a central dome 120 feet high. The plan dispenses with stained-glass windows,—a wise arrangement in dark London. Twenty-nine marble columns support aisles, galleries, and arches of transepts, with bases of Norwegian granite and capitals of white Carrara elaborately carved. Many of the Nonconformist churches are handsome structures. Among the finest of them are the City Temple on the Viaduct, opened in 1874; Christ-church in Westminster Bridge road; the Apostolic (or Irvingite) church in Gordon Square; and the Tabernacle, Newington Butts; while the site of the former Royal Aquarium at Westminster is to be occupied by a mammoth connective building, built by the Wesleyan Methodists.

The Houses of Parliament.—These consist of the House of Peers and the House of Commons, with the connected apartments and offices, the whole practically forming one structure. It is a highly decorated structure in the Tudor Gothic style, after designs by Sir Charles Barry. It stands on the left bank of the Thames, between the river and Westminster Abbey, and extends over an area of about 8

LONDON.

1. Trafalgar Square.

2. Houses of Parliament.

acres. The façade which overlooks the river is 900 feet in length. The walls are of brick, faced externally with magnesian limestone, and the whole edifice is separated from the river by a terrace of Aberdeen granite. It is paneled with rich tracery, and profusely decorated with statues and shields of arms of the kings and queens of England from the Conquest to the present time. In the southwest angle is the Victoria Tower, supported on four pointed arches 60 feet in height; it is 75 feet square and 340 feet in height. There is also a tower in the centre, 300 feet high by 60 feet, surmounted by a lantern; and the clock tower, at the north end of the edifice, with its richly decorated spire, rises 320 feet. The House of Peers is an apartment 97 feet long, 54 feet wide, and 45 feet high; magnificently decorated throughout with carved oak paneling, a profusion of gilding, paintings in fresco, and richly stained glass windows. The House of Commons is a somewhat smaller apartment, fitted up in a much plainer style. Paintings in fresco and the water-glass medium, and statues of great statesmen have been added to the internal decorations; and a statue of the architect has been placed on the staircase leading up to the committee rooms. Westminster Hall, the most magnificent hall in the kingdom, 290 feet long, was built by William Rufus and improved by Richard II. The hall is not now used except as a members' entrance to the House of Commons.

Palaces.—Saint James', erected by Henry VIII., from a design by Holbein, at the foot of Saint James' Street, is an irregular and picturesque brick building. It is well adapted internally for royal levees and drawing rooms, which are held here during the fashionable season. Buckingham Palace, facing the west end of Saint James' Park, was built by George IV., and consists, since the erection of the east front, of a quadrangular range of buildings. In the gallery, which is 160 feet long, are some good pictures. The king resides here occasionally in the spring and summer. Whitehall—the Banqueting House—designed by Inigo Jones in the Paladian style, is the only remnant of the ancient palace of Whitehall; the ceiling, painted by Rubens, is the most extensive work of that artist existing in the country. Kensington Palace, in Kensington Gardens, is a brick building of the Jacobean period, and was thrown open to the public by Queen Victoria shortly before her death. It was the birthright of Her Majesty. Lambeth Palace on the Surrey side of the river, opposite the Houses of Parliament, has been for many centuries the residence of the archbishops of Canterbury. It is a brick edifice, and comprises a great variety of styles in architecture, from Early English downward, and contains a library of 30,000 volumes. Fulham Palace, the residence of the bishops of London, is a building of no architectural pretension. It is pleasantly situated on the Thames, and at one time had extensive and well-timbered grounds. Greenwich Palace, once the home of the Tudor and Stuart sovereigns, is a stone building of considerable beauty, now used as a training school for the navy. Eltham Palace, once a residence of Henry VIII., is now a picturesque and well-preserved ruin.

Government Offices.—These are mostly

situated in and near Whitehall. The Treasury, Home Office, and Education Department occupy one range of buildings, which have been improved by a uniform and handsome façade. The India Office and the Local Government Board face Saint James' Park. The Horse Guards, which are somewhat nearer Charing Cross, have little to admire in their external appearance, but opposite, and next to the Banquet Hall of the old Whitehall Palace, from the window of which Charles I. stepped to his execution, rises the New War Office, and farther on the New Admiralty Office. An extensive pile of government offices, for the Foreign Office and the Colonial Office, has been erected in Downing Street. The style is Italian and the building exhibits a large amount of decorative detail, part of it in red and other colored marbles and granites. Some of the public offices are in Somerset House, once a royal palace of Charles II. It has a spacious and handsome quadrangle, finished in 1782, from designs by Sir W. Chambers; its north façade, 200 feet in length, faces the Strand; and its south front, 800 feet long, overlooks the river. The Post-Office, near Saint Paul's, is a spacious and handsome building. It is 390 feet long, 130 feet wide, and 64 feet high. Its façade, which is toward Saint Martin's-le-Grand, has three Ionic porticoes. A supplemental building for telegraph and other business occupies the opposite side of Saint Martin's-le-Grand. The Mint, a stone building of the ordinary Georgian architecture, finished in 1810, stands on Tower Hill, and occupies about 10,000 square yards. The royal arsenal and dockyard for military stores is at Woolwich.

Courts of Law.—London is the seat of the supreme courts of the kingdom. Several of these were long accommodated at Westminster Hall, but in 1883 were removed to the New Law Courts at the junction of the Strand and Fleet Street. This great building occupies an area of nearly four acres. It is of a somewhat heavy mediæval character, a large western tower being its chief feature. The Old Bailey, adjoining the famous Newgate Prison, has, with the latter, been demolished to make way for the palatial Sessions House of the City of London. It is the central criminal court for the trial of prisoners who have committed serious offenses in the metropolitan district. One or more of the judges of the law courts sit here also in the old court, while the new court is presided over by the recorder and common sergeant of the City of London. There are numerous county courts within London for the trial of small debt cases. Besides the above there are also the Clerkenwell Session House; the city police courts, which are held at the Mansion House and Guildhall, and are presided over by the lord-mayor and one of the aldermen; and numerous police courts, each of which is presided over by a barrister of at least seven years' standing. The Inns of Court, as they are called, are four, the Inner Temple, Middle Temple, Lincoln's Inn, and Gray's Inn. Every law student, before he can be called to the bar, has to be entered as a member of one of these inns, and to dine a certain number of times in the common hall. The Inner and Middle Temple are close to Temple Bar, between Fleet Street and the river. The roof of Middle Temple Hall, built in 1572, is con-

LONDON

sidered the best specimen of Elizabethan architecture in London. Lincoln's Inn is situated between Chancery Lane and the extensive square called Lincoln's Inn Fields, now open as a public garden. A handsome hall and library in the Tudor style, from the designs of Hardwick, have been erected in the gardens. Gray's Inn stands on the north side of Holborn. The other "Inns," Staple Inn, New Inn, Sergeant's Inn, are now in private hands and not connected with the law.

Clubs.—Many of these establishments, having most elaborate and ornate buildings, are among the principal architectural features of West London. They are situated chiefly in and near Pall Mall and vie with each other in elegance and luxury. The principal are: the Athenæum, possessed of a fine library, and having a great many artists and men of science and letters among its members; the Army and Navy, the United Service, the Guards', and the Junior United Service; the Carlton, the great Tory Club, standing side by side with the Reform Club in Pall Mall, the former numbering 1,800 and the latter 1,400 members; the Junior Carlton; the Oriental; the Travelers'; Brooks, one of the oldest of the clubs; White's, a still older club, much frequented by the Conservative nobility; the Conservative; the Devonshire; the Oxford and Cambridge; the Garrick, frequented by lovers of the drama; and four political clubs, which have the largest numbers of members, the Constitutional having 6,500, the National Liberal 7,000, the Junior Conservative 5,500, and the Junior Constitutional 5,000.

Hotels.—The Grand Hotel, Trafalgar Square, occupying part of the site of old Northumberland House; the Victoria Hotel and Hotel Metropole in Northumberland Avenue; the Hotel Cecil in the Strand; the Savoy Hotel on the Embankment; the Carlton Hotel at the corner of the Haymarket; the Russell Hotel, occupying the greater part of the east side of Russell Square, recently built; and De Keyser's immense hotel at Blackfriars, are the most important and attractive. There are large hotels at Charing Cross and Cannon Street in connection with the South Eastern railway, at St. Pancras in connection with the Midland railway, the last named being the largest and one of the handsomest in London; and at Marylebone in connection with the Great Central railway. Also associated with railways are the Great Western Hotel at Paddington; the Great Northern Hotel in King's Cross; the Grosvenor Hotel at Pimlico. Other large hotels are the Langham Hotel, Portland Place; the Westminster Palace Hotel in Victoria Street; the Salisbury Hotel, in Salisbury Square, Fleet Street; the First Avenue near Gray's Inn; and the famous Ship Hotel at Greenwich.

Theatres, Public Halls, etc.—The principal theatres are Covent Garden (the Royal Opera House), opened in 1858; His Majesty's, the historic Drury Lane, the Haymarket, the Strand, the Adelphi, the Surrey, the Gaiety (recently demolished and rebuilt), the Vaudeville, Saint James', the Savoy, the Avenue, the Comedy, Criterion, Terry's, the Lyric, the Garrick, the Shaftesbury, the Duke of York, the Prince of Wales, Wyndham's, and the Court. There are also many new erections, whose

names are not so familiar as those just named. Local theatres have been built in many of the outlying parts of London. Saint James' Hall, remarkable almost entirely for its interior and chiefly devoted to musical entertainments of a high class, has recently been demolished. The Queen's Hall in Portland Place, and the Albert Hall at Kensington, are devoted to high-class music. Hanover Square Rooms were once famous as concert rooms. Exeter Hall, in the Strand, is occupied by the Young Men's Christian Association, and is used also for the annual May meetings of the different religious societies. The Freemasons' Hall in Great Queen Street, is well known, and Olympia, at West Kensington, is a large and imposing hall in an extensive area. The Congregational Memorial Hall, and the Agricultural Hall, Islington, the largest covered area in London, are also important buildings of this kind. The Empire and the Alhambra in Leicester Square are the chief of numerous music halls in London.

Markets.—These are numerous, but have generally little to attract either in external beauty or in internal arrangement. The principal ones are: Billingsgate for fish; the Borough Market, Southwark, and the famous Covent Garden for vegetables, fruit, flowers, and plants; Leadenhall for poultry, game, etc.; Deptford for foreign cattle; Smithfield for fresh meat, poultry, and fish; the Islington cattle market, in the Caledonian road. The Spitalfields market and the Woolwich market, for vegetable products, are included in the public markets. But London is inadequately provided. The city corporation owns all the largest markets, and exercises charter rights to prevent others being erected. The result is that all retail markets are in the hands of costermongers.

Museums, Galleries, Libraries.—The British Museum (q.v.), founded in 1753, in Great Russell Street, is a spacious and imposing edifice, with a classical façade and sculpture in the pediment, built between 1823 and 1857. It contains an immense collection of books, manuscripts, engravings, drawings, sculptures, coins, minerals, stuffed animals, fossils, preserved plants, etc., and a magnificent collection of ethnographical objects, Egyptian, Assyrian, Etruscan, Greek, and other antiquities. An extensive building (about 650 feet long) has been erected in the South Kensington quarter for the accommodation of the natural history collections. The museum of the Royal College of Surgeons, on the south side of Lincoln's Inn Fields, a rather handsome building, contains a magnificent collection of human skulls from all parts of the world, and many curious surgical preparations. The Sloane Museum, on the north side of Lincoln's Inn Fields, possesses many valuable objects, consisting of books, paintings, prints, MSS., drawings, maps, models, plans, etc. The Dulwich College gallery contains many interesting pictures left by Alleyne, a contemporary actor of Shakespeare's age. The great South Kensington or Victoria and Albert Museum contains most valuable collections, carefully arranged for purposes of instruction, in connection with which are the Schools and headquarters of the Department of Science and Art. Museums have also been established at Bethnal Green and in South and

LONDON

North London, and quite recently Hertford House, with its priceless art treasures, the gift of Sir Richard Wallace, and the Horniman Museum at Forest Hill, the gift of the late Mr. F. J. Horniman, have been added to the London museums. The chief picture gallery in London is the National Gallery, on the north side of Trafalgar Square. It contains about 1,200 paintings, acquired partly from donations, partly by purchase. The National Portrait Gallery is a collection of over 1,100 portraits, busts, and medallions, brought together since 1858. For this collection a new building beside the National Gallery has been provided by private munificence; and the Tate Gallery of British Art, on the Thames Embankment, has been similarly acquired. The Royal Albert Hall of Arts and Sciences, a memorial to the late prince consort, is a huge building between the Horticultural Gardens and Kensington road. It was erected for the purposes of science and art, musical performances, exhibitions, etc. It is chiefly used for concerts and is capable of accommodating an audience of 8,000, while the orchestra itself accommodates 1,000 performers. The building also contains a picture gallery. In Hyde Park, immediately opposite this building, is the Albert Memorial. The north wing of Burlington House, Piccadilly, has been granted to the Royal Academy and a suite of rooms built in the rear of it for exhibitions. The east and west wings of Burlington House are occupied by various learned societies, the Royal Society, the Society of Antiquaries, and others. Near the South Kensington Museum and the Albert Hall is the splendid block of buildings of the Imperial Institute, with its various permanent collections, and exhibitions, and institutions. Besides the British Museum library the chief libraries are Lambeth Palace library, the Guildhall library, Sion College library, the London Library (subscription), London Institute library, and in addition large circulating libraries and many free public libraries supported by taxes.

Educational Institutions.—At the head of these stands the London University (q.v.), which promises to become the foremost scientific university in the kingdom. Other institutions are denominational colleges for theology (in some combined with general education), the Royal Naval College, Greenwich; the Royal Military Academy, Woolwich; the Royal College of Science; the medical schools attached to the hospitals; Royal Academy of Music; Royal College of Music; Trinity College, chiefly for music; several colleges for ladies, etc. Among the grammar and secondary schools are Saint Paul's School, founded in 1509, which provides a free education for 153 boys, with scholarships to Oxford and Cambridge; the Merchant Taylors'; Westminster School, founded by Queen Elizabeth in 1560; University College School, King's College School, City of London School, Mercers' School, and schools of the several other city companies. Besides the above and numberless private schools, there are the City and guild institutions for technical education, many high schools for girls, many free schools, numerous schools of the National Society, and more than 500 schools of the London county council. Several polytechnics and centres of technical education have been equipped and sup-

ported by the London county council, who have also established a system of county scholarships for students.

Scientific Associations, etc.—Associations for promoting science, art, learning, etc., are exceedingly numerous. The chief are the Royal Society, Burlington House, founded in 1660; the Society of Antiquaries, in the same building, originally founded in 1572; the Royal Academy (of painting, etc.), in Trafalgar Square, founded in 1768; the Royal College of Physicians, founded by Linacre, physician to Henry VIII., in 1518; the Royal College of Surgeons; the Royal Geographical Society, with a choice geographical library and large collection of maps; the Institution of Civil Engineers; the Royal Institute of British Architects, possessing a good library of architectural works; the Royal Institution of Great Britain, established in 1799; the Royal Horticultural Society, which possesses the botanic gardens in Regent's Park, as also at South Kensington and at Chiswick; the Royal Astronomical Society; the Royal Asiatic Society; the British Association; the Zoological Society, with its collection of animals in Regent's Park; the Geological Society, and the Anthropological Institute.

Hospitals and Charitable Institutions.—Besides the three great endowed hospitals: Saint Bartholomew's, in West Smithfield; Guy's, Southwark; and Saint Thomas, Lambeth, occupying a large and splendid range of buildings on the Thames Embankment opposite the Houses of Parliament; there are the London Hospital, Saint George's Hospital, the Middlesex Hospital, Westminster Hospital, Charing Cross Hospital, King's College Hospital, University College Hospital, Saint Mary's Hospital, and Royal Free Hospital, all with medical schools attached. Other general hospitals are: The Great Northern Hospital, the West London Hospital, and the Metropolitan Hospital; besides the German Hospital, Dalston; hospitals for special diseases, as consumption, fever, cancer; hospitals for women, for children, etc. Bethlehem Hospital (Bedlam), in Saint George's Fields, south of the river, is the chief hospital for lunatics; Saint Luke's Hospital is also for insane patients. The Foundling Hospital (see FOUNDLING) is rather an asylum for illegitimate children generally than a hospital for foundlings. Chelsea Hospital and Greenwich Hospital are institutions by themselves.

Prisons.—There are altogether about a dozen criminal prisons. The most celebrated of these, Newgate, near Saint Sepulchre's Church, a gloomy and massive structure, the scene of a great many executions, was pulled down in 1903. Millbank penitentiary, or prison, an immense brick edifice with external walls enclosing upward of 16 acres has been demolished, and the site utilized partly for workmen's dwellings, and partly for the Tate picture gallery. The chief existing prisons are the Wandsworth prison, Holloway prison (for females); the model prison, Pentonville, containing 1,000 cells, in which the inmates are taught useful trades; Wormwood Scrubs prison, a large building standing on the borders of London.

Squares and Public Monuments.—The squares of London are characteristic; many of them are of great beauty and extent, and planted

LONDON

with shrubbery. Among them are: Saint James' Square, north of Pall Mall; Eaton, Belgrave (10 acres), Grosvenor, Portman, Cavendish Squares, all in the West End; Russell Square (10 acres), Bedford, Bloomsbury, Tavistock, and Euston Squares, in the west central part of the town; Trafalgar Square, at Charing Cross, fronting one of the principal thoroughfares, and adorned with public buildings, fountains, the Nelson Column, and statues of Charles I., George IV., and others. "The most conspicuous public monuments are: 'the Monument' on Fish Street Hill, London Bridge, a fluted Doric column, 202 feet high, erected in 1677, in commemoration of the great fire of London; the York Column, at the south end of Waterloo Place, a plain Doric pillar of granite, 124 feet high, surmounted by a bronze statue of the Duke of York; a fluted Corinthian column in Trafalgar Square, 176½ feet high, raised in honor of Nelson, and surmounted with a colossal bronze statue of the hero, having the pedestal decorated with bronze sculptures in high relief, and four magnificent lions, by Sir E. Landseer, at the angles; the Albert Memorial, Hyde Park, the most splendid and costly monument of recent times, being a Gothic structure, 176 feet high, with a colossal seated statue of the prince under a magnificent canopy elaborately sculptured and adorned; and the projected magnificent memorial to Queen Victoria with its beautiful surroundings in front of Buckingham Palace. There is a statue of the Duke of Wellington in front of the Exchange, and a statue of Sir Robert Peel at the top of Cheapside. Statues of Sir Charles J. Napier, Sir Henry Havelock, and General Gordon stand in Trafalgar Square. On the Thames Embankment, not far from the Temple, now stands the Egyptian obelisk known as Cleopatra's Needle; and west of it are statues of Robert Raikes, the founder of Sunday schools, General Outram, John Stuart Mill, and others. In Waterloo Place is a memorial to the Guards who fell in the Crimea, and here is also a statue of Sir John Franklin. An equestrian statue of the Duke of Wellington at Hyde Park Corner was erected in 1888. A monument to Sir Hugh Middleton, who brought the New River water to London, has been erected on Islington Green. Among other memorials are: The Westminster Crimean Memorial, in the open space at the west of the Abbey; the Peabody statue behind the Royal Exchange; an equestrian statue of Prince Albert in Holborn Circus, a statue of Carlyle on Chelsea Embankment, and of Lord Beaconsfield in Westminster Palace Yard.

The Parks.—Of these the finest and most fashionable is Hyde Park (q.v.), which lies between the Uxbridge and Kensington Roads, and contains about 364 acres. Kensington Gardens (275 acres), with which Hyde Park communicates at several points, are beautifully wooded and finely laid out. Here carriages are not admitted. Saint James' Park (93 acres) extends from Buckingham Palace to the Horse Guards, and in its centre is an ornamental sheet of water, studded with islets covered with trees and shrubs, and around which swim a great variety of aquatic fowls. The Green Park, 53 acres in extent, lies between Saint James' Park on the south and Piccadilly on the north. Re-

gent's Park, on the north side of London, covers an area of 472 acres. Round the park is a drive nearly three miles long, and an inner circular drive encloses the Botanic Gardens. At the north end are the Zoological Gardens, to which a fine broad avenue leads along the centre of the park. Battersea Park (200 acres) is on the south bank of the Thames, opposite to Chelsea Hospital. Victoria Park (217 acres) is in the northeast of London, laid out and planted as a place of recreation for the poorer inhabitants of this part of London. Southwark Park (63 acres) is another artificially formed recreation ground. Greenwich Park (185 acres) is one of the most delightful features of South London, and has great natural beauties; the famous Greenwich Observatory is situated here. There are many other parks acquired for use of the public during late years. Brockwell Park and Dulwich Park in the south; Avery Hill in the southeast; Finsbury Park and Clissold Park, on the north borders of London, are the most extensive. But even more typically a part of modern London are the numerous and beautiful heaths and commons preserved for the public: Hampstead Heath on the north, Hackney Marsh on the northeast, Blackheath and Plumstead Common on the southeast, and Totting and Streatham commons on the south.

Places of Popular Resort.—There are various places of popular resort in London. The Exhibition at Earl's Court, a vast open-air entertainment accompanied by exhibits of special descriptions arranged in courts and buildings within the grounds, is the largest. Olympia at Kensington is of less magnitude. The Zoological Gardens and the Botanical Gardens, both in Regent's Park, are very largely frequented. The People's Palace, established by contributions of the benevolent, in the East End of London (Mile-end road), and opened in 1887, provides a hall for concerts and other entertainments, a library and reading rooms, swimming baths, gymnasiums, social meeting rooms, winter garden, technical schools, etc. Outside London there are other places of this description. The most important is the Crystal Palace (q.v.), at Sydenham, formed to a considerable extent of the materials of the exhibition building of 1851, removed from Hyde Park. It was originally designed as a great educational museum of art, natural history, and ethnology; and its gardens and fountains were to rival or surpass those of Versailles. For years music has taken an important place in the arrangements of the palace. Entertainments of merely amusing character have also been largely introduced. A somewhat similar building is the Alexandra Palace, occupying a conspicuous site on Muswell Hill on the north. Kew Gardens (q.v.) on the west and Hampton Court Place (q.v.) and grounds, built by Cardinal Wolsey and enlarged by William III., are situated further out toward the southwest.

Lighting, Sewerage, and Water.—London is supplied with gas by seven separate companies. These companies include in their area of supply a considerable district outside London. Since 1886 a large number of electric lighting companies have come into existence; in 1905, 13 companies and 16 local administrations possessing statutory powers to supply electricity. The sewerage

works with which the Metropolitan Board was charged, were formally opened in 1865. The system consists of lines of intercepting sewers on both side of the Thames intersecting the old outlets, which are retained for service during heavy rainfalls. It consists of three main lines on the north of the river, at different levels, called respectively the High Level, Low Level, and Middle Level Sewers; and of three on the south side, called the High, the Effra, and Low Level Sewers. The lines on the north side converge at Lea river, whence, after the Low Level sewage has been pumped to the higher level, the whole flows in five parallel brick culverts, built in an embankment upward of 5 miles in length, on to the Northern Outfall and reservoir, about 14 miles below London Bridge. On the south side the Low Level sewage is pumped to the higher level at Deptford, whence the whole is conveyed to a point near the mouth of the river. The total length of main and intercepting sewerage is 288 miles, and the area drained is 140 square miles. Considerable extensions are in progress. Works have been established for precipitating the sewage; the deposit after precipitation, amounting to 5,000 tons daily, is carried out to sea and deposited several miles from land. There were formerly eight companies supplying London and an extensive area around extending into Essex, Hertfordshire, Kent, Middlesex, and Surrey. In June and July, 1904, the undertakings of these companies were transferred to the Metropolitan Water Board. The total quantity of water supplied amounts to nearly 220,000,000 of gallons daily. Rather more than 122,000,000 of gallons of this is supplied from the Thames, 53,000,000, from the Lea, and 44,000,000 from springs and wells. By an act passed in 1852 all the companies making use of the Thames are obliged to draw from above the limit of the tidal flow. Even above this point the water is not free from pollution by the sewage of numerous populous towns and by the drainage of richly-manured land. Means are adopted for storing the water, and it is all filtered through layers of gravel and sand before entering the mains; but the system of supply is liable to various objections, and the total quantity is inadequate to meet the entire wants of the population. Commission after commission, and committee after committee, have examined and reported on this important subject, but in 1896, 1897, and 1898, the whole east end of London and much of the south suffered from want of proper water supply.

Cemeteries.—The provision of cemeteries for London is in the hands of the metropolitan borough councils and of private companies. Many of those provided by the borough councils and most of those under private management are situated outside the county. Amongst the latter may be mentioned Kensal Green Cemetery, in which several royal personages have been buried. It was opened in 1832, occupies about 70 acres of ground, and is tastefully planted and laid out. Kensal Green Roman Catholic Cemetery occupies 30 acres. Interments are permitted in St. Paul's Cathedral and Westminster Abbey. The City of London Cemetery is at Ilford, in Essex.

Communications.—The London population commands two systems of locomotion, namely,

internal and external. The former has reference to the purely London requirements, and is by means of omnibuses, cabs, tramways, steamboats, and railways; the latter has reference to the connection of London with the rest of the kingdom and the Continent, and is by canals, railways, and the Thames. The internal traffic of London has become almost overwhelming. There were over 11,000 cabs, 3,500 omnibuses, and 1,700 tram cars licensed during the year 1904. There are also available the Metropolitan, the Metropolitan District, and the Electric Railway systems, and the local systems on other lines. These are extending in all directions. The great English railways long ago reached the limit of their ability to cope with suburban traffic in and out of London. The old underground railway was designed to be complete in an inner and outer circle, but the outer circle was found to be insufficient before it was built, while the inner circle does not even touch what might be called suburbs. Yet so long as it was without competition the two companies owning this system drew great dividends and ignored the demands of their dependent patrons for better service. Not until competition arose in the shape of the Central London electric tube railway did the directors of the District and Metropolitan Lines bestir themselves. American enterprise in acquiring control of the District Underground brought a flood of underground railway schemes forward, and parliamentary committees have been kept busy deciding between rival schemes. They have been careful to reserve all manner of rights to the government, refusing, for instance, to grant any route unless the proposed company agreed to provide and maintain a subway for pipes and wires along its lines. This is an effort to unravel the tangle of such things which the least upturning of the streets shows. These lines are also refused complete independence of each other, and are compelled to arrange transfers and joint time tables. In March 1906 there were 20½ miles of deep railways open for traffic in the county, while 41½ miles were authorized to be constructed in Greater London. The cost of such railways varies from £377,200 to £907,680 per mile of double line of rails, including stations. The great objection in London to shallow tram-subways, such as are now used in Paris and in New York, is the necessity of torn-up streets for a long period, as well as the difficulty of disposing of the soil so near the surface. The tubes, after the fashion of burrowing animals, must necessarily dispose of their soil at the end of their tunnel only. It is safe to predict that in ten years it will actually be possible to traverse London by public conveyance more quickly than one could walk or go in a cab. Now, for lack of means, or of co-operation when there is means, the task is hopeless. The number of passengers who traveled in 1904 on the cars owned by the two principal omnibus companies amounted to nearly 289,000,000 and passengers by tramways amounted to nearly 434,000,000. Previously to 1905 the Thames had almost been allowed to drop out of existence as a local traveler's route. By the Thames River Steamboat Service Act, 1904, however, the London County Council obtained powers to run steamboats on the Thames

LONDON

and the service was inaugurated by H. H. H. the Prince of Wales on 17 June 1905. The total number of passengers carried from that date to 31 March 1906 was 3,683,912, and by tramways nearly 300,000,000. The principal railway stations are: The Great Eastern, Liverpool Street, Fenchurch Street; the London, Tilbury, and Southend, Fenchurch Street; the London and North Western, Euston; North London, Broad Street; Great Western, Paddington; the Great Northern, King's Cross; Midland, St. Pancras; Great Central, Marylebone; South Eastern, London Bridge, where there is a congeries of stations, Charing Cross and Cannon Street; London, Chatham, and Dover, Ludgate Hill and Victoria; the London, Brighton, and South Coast railway, Victoria and London Bridge; the South Western, Waterloo. Many of these stations communicate by the Metropolitan and District railways, distinct systems, but both popularly known as the "underground," affording means of internal communication within the city. Many of the termini are elaborate piles of costly architecture, and have associated with them large and handsome hotels. The Thames affords communication by steam vessels with the most important points on the British and Continental coasts, as well as with all parts of the world.

Manufactures.—It is impossible within the limits of this article to specify the different kinds of articles manufactured in London. It contains the largest breweries, distilleries, and sugar refineries in the kingdom; was long the principal seat of silk weaving; has extensive manufactures in metal, including machinery of all kinds, plate jewelry, watches, and brass work, and an enormous production of books and prints. Millinery, the making of clothes and of boots and shoes, are also extensive branches of industry. Besides these, there are cabinet making, coopering, coach building, rope making, leather working, hat making, ship building, mast making, etc., all of which are departments of manufacture conducted on a large scale; and there are numerous extensive chemical works, soap manufactories, and dye works. It is not generally known that London is a very large manufacturing centre.

Commerce, Docks, etc.—The port of London extends from London Bridge to the Nore and is divided into the Pool, Limehouse Reach, Greenwich Reach, Blackwall Reach, etc. It is under the care of the corporation of the city for sanitary purposes, under the Thames Conservancy for navigation, and under all sorts of other authorities for various other purposes. It is probably the worst managed port in the world. The docks, some of which are of great extent, are surrounded by wharves, sheds, storehouses, vaults, and warehouses of the most spacious kind. St. Katherine's docks, London docks, the West India docks, the East India docks, and the Millwall docks (in the Isle of Dogs) extend along the north side of the river at intervals from the Tower to Blackwall; and on the south side, between Rotherhithe and Deptford, are the Surrey Commercial docks. The tide rises 18 feet at springs and 14 feet at neaps at the London docks; and the depth at low water, spring tides, on the outer sill of St. Katherine's docks is 10

feet. The largest of these older docks is the West India import dock, 2,600 feet long and 500 broad. The dock accommodation of the port was greatly increased by the construction of the Victoria and Albert docks, which follow next in order on the north side of the river (opposite Woolwich) and have a combined length of $2\frac{1}{2}$ miles, with a water area of 177 acres. The Victoria dock was opened in 1855, the Albert dock in 1880. The depth over the sill of the east entrance of the latter at high water is 30 feet. Besides these, there are now the splendid docks at Tilbury, on the Essex shore opposite Gravesend, constructed for the purpose of admitting the largest vessels at any state of the tide. Here there are a tidal harbor, graving dock, 3 miles of quays, sheds covering 20 acres, etc. The vessels belonging to the port in 1904, numbered 1,404 sailing and 1,840 steam; aggregate tonnage, 2,111,107. Its exports of British and foreign produce in 1904 amounted to £94,996,101; the imports to £174,475,656. Out of 11,092 vessels that entered in the foreign and colonial trade in 1904, 6,034 were British, 1,403 Dutch, 893 Norwegian, 1,011 German, 401 Swedish, 289 Danish, 354 Belgian, 287 French, 214 Russian, 103 Spanish, 29 Italian, 31 Austro-Hungarian, 22 Greek, 8 United States, and 13 of other nationalities, the total of all foreign vessels being 5,058. For East and West India produce London is the great port; tea, sugar, tobacco, wine, corn, timber, tallow, hides, wool, and drugs form large items.

The amount of customs revenue received in 1904 was £14,638,707. The value of the imports is about one-third, of the customs revenue forty per cent. of the whole amount for the United Kingdom.

The following table gives particulars for 1904 of the shipping entering and clearing at the port of London from and to foreign countries and British colonies and coastwise:

1904.	Sailing.	Steam.	Tonnage.
Entered.			
Foreign.....	1,360	7,876	7,652,574
Colonial.....	312	1,544	3,135,698
Coasting.....	4,060	11,946	6,285,640
Total.....	5,732	21,366	17,073,852
Cleared.			
Foreign.....	995	6,250	6,007,098
Colonial.....	136	665	1,843,849
Coasting.....	5,300	14,016	8,400,587
Total.....	6,431	21,040	16,251,474

Administration.—London is governed by the county council with the city corporation and 28 metropolitan boroughs administering local matters. The most ancient civic officer of London is the lord-mayor of the city of London. He is annually elected from among the aldermen who have been sheriffs of the city, on 29 September, and installed in office on 9 November, when a procession takes place, called the lord-mayor's show. The court of aldermen consists of 26 members, including the lord-mayor. They are chosen for life by the taxpayers of the wards. There are 27 wards. One alderman is elected for each of 24 wards, one for 2 wards,

LONDON

and one serves (*is not elected*) for a nominal ward. They are properly the subordinate governors of their respective wards, under the jurisdiction of the lord-mayor, and preside over the business in the courts of Wardmote. The civic sheriffs, two in number, are annually chosen by the livery or general assembly of the freemen of London. The common council is a court consisting of 206 representatives returned by 26 of the wards in proportion to their relative extent; the 27th, or Bridge Ward Without, being represented by an alderman. The general business of this court is to legislate for the internal government of the city, its police, revenue, etc. The recorder is generally a barrister of eminence, appointed for life by the lord-mayor and aldermen as principal assistant and adviser to the civic magistracy and one of the justices of oyer and terminer. The "livery" of London is the aggregate of the members of the several city companies, of which there are 75. Of these 12 are termed great companies, and from one or other of them the lord-mayor was formerly chosen. In order of precedence they are: The Mercers, Grocers, Drapers, Fishmongers, Goldsmiths, Skinners, Merchant Tailors, Haberdashers, Salters, Ironmongers, Vintners, Clothworkers. Many of the companies are very rich and possess large halls. Besides the ancient city of London there are under the act of 1899, the 28 metropolitan boroughs, already enumerated, each of which for local purposes is governed by a mayor, aldermen, and council. The county council consists of the chairman of the council, 19 aldermen, and 118 councillors, the latter being elected by the taxpayers of the several divisions, which are, however, not coincident with the boroughs. Other London authorities are 31 Boards of Guardians, dealing principally with poor relief; 4 Boards of School District Managers and 2 Boards of Sick Asylum District Managers, appointed from among their own number by the guardians of those unions which are combined into districts; the Metropolitan Asylum Board, partly elected by the guardians and partly nominated by the Local Government Board, and whose chief duty is provision for infectious sick and harmless insane; the Central (unemployed) Body and 29 Distress Committees, for the provision for distress from lack of employment, the latter appointed by the City of London Corporation and the metropolitan borough councils, the former (with the exception of 8 members) appointed by the London County Council, the Distress Committees, and the Local Government Board; the Metropolitan Water Board, appointed by the London County Council and the local authorities in the area supplied by the Board.

The Police.—The city police, confined to the city proper, is administered by the city corporation as a municipal force, and numbers about 1,150 men. The metropolitan police is not municipal. It is administered by a commissioner appointed by the Home Office. It consists of nearly 17,000 men, whose central offices are New Scotland Yard, a massive building on the Embankment near Westminster Bridge. Its area of jurisdiction extends for 15 miles from Charing Cross.

For postal purposes the authorities divide the major portion of Greater London into dis-

tricts designated by their initial letters, E. C., W. C., W., S. W., S. E., E., N., N. W., signifying East Central, West Central, etc.

Sociology.—The population of the county of London in 1901 was 4,536,541. Of this number 1,202,072 were born in England (outside London), 56,605 in Scotland, 60,211 in Ireland, and 38,899 in other parts of the British empire. The alien population numbered 79,804 males and 55,573 females. The average birth-rate per 1,000 of population in 1904 was 27.9, as compared with 29 in 1901, 30.3 in 1891-1900, 33.2 in 1881-90, 35.4 in 1871-80, 35.4 in 1861-70, and 33.6 in 1851-60. There are 1,118 females for every 1,000 males. Out of every 1,000 persons of marriageable age, 367 males and 372 females are unmarried. In 1903, 36,672 bachelors were married, 37,413 spinsters, 3,590 widowers, and 2,849 widows. Of the total number of marriages 68.6 per cent. took place in the Established Church, 19.1 per cent. in the registry office, and 4.7 per cent. in the Nonconformist churches. Of the 135,377 foreigners, not naturalized British subjects, natives of Russia are the most numerous; Germany stands second, Russian Poland follows, France is fourth, and Italy fifth. The Russians in London have increased since the last census from 12,034 to 38,117—fully three-fold, that is—while Italy has doubled her contribution toward the population, now accounting for a round 10,000. Natives of the United States numbered 5,561.

History.—Though, by the evidence of its name and by archaeological remains, London was occupied by the Celtic Britons before the arrival of the Romans, it was not till the Roman era that it became a place of importance. There were probably two Roman Londons: the first destroyed by Boadicea and probably consisting of the area extending from near the Tower on the east by the course of the Langbourne (now preserved in Langbourne ward; on the north, by the course of the Walbrook on the west and the Thames on the south; the second probably coincident with the mediæval walled city. The Roman walls were destroyed by the Danes and were restored by King Alfred. After the Romans left Britain, London assumed a certain amount of independence, and throughout the Anglo-Saxon period it appears to have supported the monarch who was acceptable to the rest of the kingdom. Alfred was the first king of the Anglo-Saxons who thoroughly understood the importance of its military position. It suffered by fire in 764, 798, and 801. It was sacked by the Danes, who obtained a considerable settlement in Southwark and on the western boundary of the city beyond the Ludgate. At the Conquest London treated with and finally submitted to William. William's first act was to dominate the city by building his military stronghold, the beginnings of the Tower of London. He then granted the city its ancient rights by a charter, which is still preserved; on the accession of Henry I. a new charter was granted, and the charter grants increased considerably under the Plantagenets, while its municipal privileges were made the standard for governing many of the municipal boroughs in the provinces. London sided with Stephen against Matilda, took part in the struggle against John for Magna Charta, was severely

LONDON

oppressed by Henry III., strongly supported Edward IV. and the Yorkist party in the wars of the Roses, and was faithful to Richard III.; it equipped and dispatched ships to the navy collected to fight the Spanish Armada, and its citizens, officered by the aldermen of the city, fought for the Parliamentarian side against Charles I. Under the later Stuarts and the Georges it became more political than municipal and lost much of its ancient power. In the reign of Henry II. the walls on both sides of the river are described in a contemporary account as supplied with numerous towers; London Bridge, erected instead of a wooden one, was begun in 1176 and finished in 1209. This was to a great extent the same that was taken down in 1832. In 1218 the forest of Middlesex was cleared, and that portion of London north of the city began to be built. In the year 1328 the village of Southwark was incorporated with the city, as it had previously served as a place of refuge for malefactors. In 1349 and 1361 London was visited by the plague. In 1381 broke out the rebellion of Wat Tyler, who fell by the hands of the lord-mayor, hence the dagger on the city arms. In 1416 street lamps were introduced; in the same century some of the principal streets were paved, and wooden houses began to be replaced by others of brick. In the next century improvements were continued, and Westminster was connected with the city by a row of noblemen's mansions along the river, the last of which, Northumberland House, has made way for the road leading from Trafalgar Square to the Embankment. In the 17th century, Spitalfields was covered with houses, and the space north of the Strand as far as Holborn, and from Temple Bar to St. Martin's Lane, was extensively built on, as well as the neighborhoods of Charing Cross and Pall Mall. The New River was completed and many houses were supplied with water; sewers were dug; smooth pavements were laid down for passengers, and hackney coaches came into general use. But the streets were so narrow and dirty and the houses in so filthy a state that the city was scarcely ever exempt from the plague, which sometimes committed great ravages. In 1666 the great fire broke out and spread over 336 acres, destroying 13,200 houses, 90 churches, and many public buildings. In rebuilding, considerable improvements were introduced, and a fire in Southwark 10 years after gave a similar opportunity of improving that district. Population and trade now rapidly increased, partly from the immigration of French Protestants driven from their country by the revocation of the Edict of Nantes. In the 18th century London steadily advanced in extent, prosperity, and splendor. In 1780 took place the Gordon Riots, when the mob was in possession of London for two days and committed frightful havoc. Since that disgraceful outbreak the peace, of London has never been seriously endangered, and the troops stationed in and around the capital, together with the effective police force that now exists, seem quite adequate to insure it against any similar disturbance. The extension and improvements which took place during the 19th century are greater than in any former period, and further changes of great importance are in operation. The most re-

markable event of the century in the history of London was the carrying into effect in 1851 of the first great truly international industrial exhibition, which has since led to numerous exhibitions of a similar kind both there and abroad. In 1862 took place the second great international exhibition, and since that time various exhibitions of an international character and largely representing the colonies have been held in specially constructed buildings at South Kensington. The history of London contains many episodes of vast importance to the nation as well as to London itself. As now united for government, it will have to face problems of vast moment. The largest, most populous, and richest city that civilization has ever produced, the study of its history and its development must ever be of great importance and interest.

G. L. GOMME, F. S. A.,
Clerk to the London County Council.

London Cities and Boroughs. The County of London, nearly 120 square miles in area, is split up into 29 districts for local administrative purposes. Of these, two are cities, those of London and Westminster; one is a Royal Borough—Kensington—and 26 are boroughs. Each is self-contained and self-governing for all purely local matters, and the different districts are clearly defined and recognized. There are other areas for other purposes—for instance, the Poor Law is administered by 31 duly elected Boards of Guardians, but the districts controlled by these Boards do not exactly correspond with those governed by the Borough or City Councils. It is expected that future legislation may do away with this anomaly and make the Poor Law areas the same as those of the boroughs, possibly also abolishing the Boards of Guardians and transferring their duties to the Borough Councils. On the other hand there are those who predict the abolition of the Borough Councils also, and the unification of London under one central authority. The present system leaves much to be desired, if only for the equalization of rates, each borough differing from the others in the amount annually required—the inhabitants of the poorer districts, with their smaller rateable value, having as a rule to pay much higher rates than their more fortunate fellow citizens in districts where better conditions prevail.

Up to 1855 there was no uniformity of any sort for local administration. The City of London, the "one square mile," had from time immemorial of course been a recognized unit, with well-defined duties and responsibilities, but round it had grown up a number of districts, north and south of the river, each with different forms of administration, obtained in most cases by special Acts of Parliament. In 1855 the Metropolis Management Act attempted to reduce chaos to cosmos. It created 23 administrative vestries and 15 Boards of Works elected by the smaller vestries, in addition to the City Corporation. These bodies again elected representatives to serve on the Metropolitan

LONDON

Board of Works. The latter gave place to a directly elected body—the London County Council—in 1889. In 1899 the London Government Act was passed and came into force on 9 Nov. 1900. This Act left the London County Council and City Corporation untouched, but abolished all the vestries and local Boards of Works (of which there were 29 and 12 respectively at the date of the Act), setting up in their places 28 Borough Councils, of various sizes, rateable values, and population. The smallest one is Holborn, with 405 acres, and the largest Wandsworth, with 9,285. In point of view of population, Stoke Newington is the smallest with 52,353, and Islington the largest with 334,991.

Each borough is governed by a mayor, aldermen, and councillors, the numbers of the two latter being fixed by an Order in Council. The maximum number of members of the councils are 10 aldermen and 60 councillors in addition to the mayor, who need not previously have been a member of the council, but must be qualified to be one. The mayor may receive any remuneration the council may think reasonable. He is also, by virtue of his office, a justice of the peace for the county borough for the year of his mayoralty and the succeeding one. No one can be elected to any council unless he is either a parochial elector, or has resided in the borough for 12 months preceding his election. It is noticeable that by a special provision in the Act no woman is eligible to hold any of the above offices, although this was not the intention when the Bill was introduced. Once elected the councils remain in office for three years. The first councils took office on 9 Nov. 1900.

In the following series of short notices the principal features of these municipal districts are detailed, the statistics in most cases being compiled from the latest issued by the London County Council. Space does not allow of any additional facts to be given, but the most important local histories are mentioned, to which the reader is referred for further information.

City of London.—The City of London contains an area of about 673 acres, a rateable value of £5,360,197, and an estimated population of 25,523. The day population is estimated at considerably over a quarter of a million, and it is calculated that over a million people enter the City daily. The birth-rate is 13.8 per 1,000, and the death-rate 16.0. The City Corporation consists of a Lord Mayor, 25 other aldermen (one for each ward of the city, and one for the Ward of Bridge Without, *i.e.*, Southwark), and 206 common councillors. The Lord Mayor is usually the senior alderman who has not held the office previously. He must have served as sheriff, to which dignity he has to be elected by the liverymen of the City Companies. Each year two names are selected by the livery to be submitted to the Court of Aldermen, with whom the final choice rests. The Lord Mayor has an official residence (The Mansion House) and an allowance of £10,000 a year. He usually is obliged to spend a considerably larger sum from his private purse, and is generally the recipient of some mark of Royal favor, the close of his year of office as a rule finding him a baronet. The aldermen are elected for life by the ratepayers of the various wards which each represents. The members of

the Common Council are reappointed annually. The Lord Mayor is assisted in the ceremonial and other functions by two sheriffs, who also have many special duties of their own. They are elected by the liverymen, receive no allowance, but make considerable outlay from their private purses. One sheriff is always an alderman. Whilst the Lord Mayor is as a rule rewarded by being created a baronet, the sheriffs often receive the honor of knighthood, particularly if a Royal visit is paid to the City during their year of office.

As an administrative body the City Corporation has much fuller powers than any other corporation. It owns markets (receipts for 1903 £267,281; expenditure, including repayment of loans, £240,868) and controls its own police (independent of the Home Office, which is the ultimate head of every other police force in the country) at an annual cost of £179,060. Through the Bridge House Estate it keeps in repair the bridges connecting the City and South London (Tower, London, Southwark, and Blackfriars), and from this fund it has built the Tower Bridge and recently widened London Bridge. The charges under this head amounted in 1903 to £51,475. From it also will be provided the funds necessary to widen Blackfriars Bridge in order to allow trams to pass across it. As an educational authority it supports and controls the Guildhall School of Music (expenditure £30,505), the City of London School (£20,784), the City of London Girls' School (£3,930), and the Freeman's Orphan School (£6,883). The Guildhall Library (120,000 volumes) Museum (400,000 visitors, cost £6,610) and the Corporation Art Gallery (226,000 visitors, cost £3,208) also belong to the City.

Outside the "one square mile" the City Corporation controls and finds the money for the upkeep of a number of splendid open spaces and parks, the principal being Epping Forest, 5,347 acres; Burnham Beeches, 375 acres; and Wandstead Park, 212 acres. The total cost is £15,873 per annum. The total income of the City Corporation for 1903 was £1,279,897 and the expenditure £1,336,002. For 1904-5 the average rate made for the whole county of London was 7s. 3.8d. The lowest rate made in any one district was 6s. 2d. and the highest 10s. 2d. That of the city was 6s. 6.5d. The number of works published on London is legion. The following are typical: Knight, 'Old and New London' (1841-1844); Maitland, 'History of London' (1739); Sharpe, 'London and the Kingdom' (1894 and 1895); Welch, 'Modern History of the City of London' (1896); Wheatly, 'London, Past and Present' (1891).

Battersea has an area of 2,160 acres, a rateable value of £1,065,099, and an estimated population of 169,770. At the 1901 census it had 23,462 inhabited houses and 38,987 tenements. The birth-rate is 28.7 and the death-rate 15.3 per 1,000. The borough has many open spaces, notably Battersea Park (200 acres) and parts of Clapham and Wandsworth Commons. The council consists of a mayor, 9 aldermen, and 54 councillors. It controls three libraries with a stock of 54,384 volumes, has its own electricity supply and a municipal milk depot, as well as being a strong believer in its own works department, which was established in 1898. It has two buildings for public baths and one public wash-

LONDON

house. The district is mainly a working-class residential one and is famous as the home of the only labor member of the present (1907) Liberal Cabinet, the Right Hon. John Burns, M. P., President of the Local Government Board, who is also member of Parliament for the borough. Consult: Browning and Kirk, 'Early History of Battersea,' which is reprinted from the 'Collections of the Surrey Archaeological Society' (1891); Green and Damer, 'Clapham Junction and its People' (1889); Hammond, 'Bygone Battersea' (1897); Simmonds, 'All about Battersea' (1882).

Bermondsey was created, as it now exists, by the London Government Act of 1899, and is made up of several districts, principally the two parishes of Bermondsey and Rotherhithe. The borough has an area of 1,500 acres, a rateable value of £941,247, and an estimated population of 129,856. At the 1901 census it had 15,817 inhabited houses and 29,073 tenements. The birth-rate is 32.5, and the death-rate 19.0 per 1,000. There is only one large open space, called Southwark Park, but there are several small ones. The total area of all the open spaces of the borough is 75 acres. The council consists of a mayor, 9 aldermen, and 52 councillors. The borough possesses three libraries, with a total stock of 36,760 volumes. It also has its own electricity works, and a dust destructor in connection with them; two public baths and wash-houses. The district is very poor, and is the headquarters of the leather trade. Consult: Bell, 'History of Bermondsey' (1880); Besant, 'South London' (1899); Cassell's 'Old and New London'; Clarke, 'History of Bermondsey' (1901); Phillips, 'Bermondsey' (1841).

Bethnal Green, one of the poorest and smallest of all the London boroughs, has an area of 759 acres, a rateable value of £549,987, and an estimated population of 129,118. There is a great amount of overcrowding and a fairly high death-rate (18.4 per 1,000) as well as a high birth-rate (35.7 per 1,000), in fact, the third highest in London, being surpassed only by Finsbury and Stepney. At the 1901 census there were 14,005 inhabited houses and 28,209 tenements. There are six small open spaces and a portion of Victoria Park (about 70 acres). The council consists of a mayor, 5 aldermen, and 29 councillors. The borough possesses no public swimming bath, but has a set of ordinary baths and public wash-houses. There is no rate-supported public library, but there is a voluntary library, attached to which is a branch of the South Kensington Museum. Consult: Allgood, 'History of Bethnal Green' (1894); Gavin, 'Sanitary Ramblings—Sketches and Illustrations of Bethnal Green' (1848).

Camberwell is one of the largest of the London boroughs. It has an area of 4,480 acres, a rateable value of £1,364,397 and an estimated population of 263,611. Certain portions of the borough are thickly populated, while in others the opposite is the case. At the 1901 census there were 36,671 inhabited houses and 56,985 tenements. New houses are rapidly springing up in the outer fringe of the borough, and these figures have been largely increased. The birth-rate is 27.6 per 1,000, and the death-rate 14.2. There are several public open spaces, the two largest being Peckham Rye (112 acres) and Dulwich Park (72 acres), but in some of the districts,

particularly Dulwich, large tracts of land are not built upon, and are used for recreative purposes. The council consists of a mayor, 10 aldermen, and 59 councillors. There are six libraries, with a total stock of 60,671 volumes, and an art gallery, one of two in London controlled by Borough Councils. The borough possesses three public baths and two wash-houses. Consult: Allport, 'Collections Illustrative of the Geology, History, Antiquities and Associations of Camberwell and Neighborhood' (1841); Blanch, 'Ye Parish of Camerwell: a Brief Account of the Parish of Camberwell, its History and Antiquities' (1875).

Chelsea has an area of about 660 acres, a rateable value of £888,133, and an estimated population of 71,332. Chelsea is mainly inhabited by the well-to-do class; at the census of 1901, there were 8,641 inhabited houses and 17,467 tenements. The birth-rate is 20.5 per 1,000 and the death-rate 15.8. The council consists of a mayor, 6 aldermen, and 30 councillors. There is one public library with a stock of 44,617 volumes, and also one building for public baths. Consult: Beaver, 'Memorials of Old Chelsea' (1892); Blunt, 'A Historical Handbook to Chelsea' (1900); Davies, 'Chelsea Old Church' (1904); L'Estrange, 'The Village of Palaces: Chronicles of Chelsea' (1880); Martin, 'Old Chelsea' (1889).

Deptford (Det'ford) has an area of about 1,563 acres, a rateable value of £629,695, and an estimated population of 111,060. At the 1901 census there were 15,823 inhabited houses and 24,615 tenements. The birth-rate is 30.1 per 1,000 and the death-rate 15.7. The borough contains but little in the way of open spaces, although it is within easy access of others. The council consists of a mayor, 6 aldermen, and 36 councillors. There is a public library recently erected (stock 15,600), and also an institution for public baths and wash-houses. Consult: Dews, 'History of Deptford' (1884).

Finsbury.—With the exception of Holborn, Finsbury is the smallest of the London boroughs in point of size, as it only contains 589 acres. Its rateable value is £1,022,302, and its estimated population 102,025. The borough is densely populated; at the 1901 census there were 9,280 inhabited houses and 24,097 tenements. It is badly off for open spaces, of which it has but 16 acres. The death-rate is very high, 21.2 per 1,000, and the birth-rate 37.1. The population is a decreasing one, owing to the proximity of the borough to the City of London; and the taking over of private houses for offices. The Baths and Wash-houses Acts have recently been adopted for the borough, which also possesses one central and two branch libraries, with a total stock of 29,300 volumes. The council consists of a mayor, 9 aldermen, and 53 councillors. The Clerkenwell district is the centre of the watch and jewelry trade. Consult: Cromwell, 'History and Description of the Parish of Clerkenwell' (1828); Mitton, 'Fascination of London' (1906); Pink, 'History of Clerkenwell' (1865).

Fulham has an area of 1,703 acres, a rateable value of £902,442, and an estimated population of 149,090. Although rapidly increasing in population there is still very little overcrowding. There are only five small open spaces, containing in all about 68 acres. At the 1901 census there were 18,534 inhabited houses and 32,137

tenements. The birth-rate is 32.5 per 1,000 and the death-rate 14.5. The council consists of a mayor, 6 aldermen, and 35 councillors. There are three public libraries (total stock, 39,000 volumes), baths and wash-houses. The council also controls the electric lighting of the borough, which was inaugurated in 1901. Consult: Feret, 'Fulham, Old and New' (1900). Volume 3 of this work also contains an exhaustive bibliography.

Greenwich (Gren-itch) has an area of 3,852 acres, a rateable value of £643,406, and an estimated population of 99,383. It is, as a whole, very thinly populated, although in some parts of the borough the reverse is the case. Some districts are practically in the country, and there the population is small. In West Greenwich, on the other hand, there are about 86 persons to the acre. At the 1901 census there were 14,240 inhabited houses and 19,702 tenements. The birth-rate is 27.3 and the death-rate 13.6 per 1,000. The borough has many open spaces, containing the Greenwich Park (in which is situated the famous Observatory), parts of Woolwich and Blackheath Commons, and other places, about 390 acres in all. The council consists of a mayor, 5 aldermen, and 30 councillors. At present there is only one public library, recently opened, with a stock of 9,700 volumes in the lending library (the reference library is not yet stocked), but another is in course of erection. There are public baths and wash-houses. Consult: Howarth, 'Greenwich' (1886); L'Estrange, 'The Palace and the Hospital' (1886).

Hackney has an area of 3,289 acres, a rateable value of £1,231,108, and an estimated population of 220,773. At the 1901 census there were 30,634 inhabited houses and 48,794 tenements. The birth-rate is 27.7 per 1,000, and the death-rate 14.5. There are 618 acres of open spaces in the borough, including Hackney Common and Hackney Marsh. The council consists of a mayor, 10 aldermen, and 60 councillors. At present there is no public library, but a grant of £25,000 has been received from Andrew Carnegie for buildings. There will be a central and two branch libraries, and it is planned to open the former at the end of 1907. The foundation stone was laid by Princess Christian in the early part of the year. The public baths are amongst the finest in London. The council also controls the electricity supply. Recent county council improvements have greatly widened the main thoroughfare of the borough—Mare Street, Up to 1894 Stoke Newington formed part of Hackney. Consult: Robinson, 'History and Antiquities of Hackney' (1842).

Hammersmith has an area of 2,286 acres, a rateable value of £801,488, and an estimated population of 114,765. The latter is rapidly increasing. At the 1901 census there were 15,198 inhabited houses and 25,810 tenements in the borough. The birth-rate is 25.9 and the death-rate 14.7 per 1,000. The principal open spaces are Ravenscourt Park and Shepherds Bush Green. There are three public libraries with a total stock of 41,984 volumes; a new central library has recently been opened, provided by Andrew Carnegie. Up to the present there are no public baths and wash-houses, but a site has been acquired on which a building will be shortly erected. The electric light is under the control

of the corporation, which consists of a mayor, 6 aldermen, and 36 councillors. Consult: Atwood, 'Endowed Charities of Hammersmith' (1856); Bowack, 'Antiquities of Middlesex' (1705); Burt, 'Historical Notices of Hammersmith' (1871); Faulkner, 'History and Antiquities of Hammersmith' (1839).

Hampstead (Ham-sted) has an area of 2,265 acres and a rateable value of £1,088,075. The population is mainly residential, of a well-to-do class, and is now estimated to be 84,895. The birth-rate is 17.1 per 1,000 and the death-rate 11.2, the latter being the lowest in any London district. At the 1901 census there were 11,294 inhabited houses and 16,998 tenements. The borough is managed by a council consisting of a mayor, 7 aldermen, and 42 councillors. There are 350 acres of open spaces, the principal one being the famous Hampstead Heath. There are five libraries, with a total stock of 69,000 volumes; public baths and wash-houses. The council also has its own electric light installation. Consult: Baine, 'Records of Hampstead' (1890); Howitt, 'Northern Heights' (1869); Park, 'Hampstead' (1814); White, 'Sweet Hampstead' (1900 and 1904).

Holborn (Ho-burn) is the smallest of the metropolitan boroughs in size, for it only possesses an acreage of 405. Its rateable value is £1,037,700, and its population 56,612. The borough links into one many small districts, and includes Lincoln's Inn, Grays Inn, Staple Inn, and part of Furnivals Inn. The birth-rate is 28.3 per 1,000 and the death-rate 20.6. At the 1901 census there were 4,703 inhabited houses and 13,790 tenements. There is considerable overcrowding, and, as has been seen, the death-rate is very high. The only open space is Lincoln's Inn Fields, containing 9 acres. The council consists of a mayor, 7 aldermen, and 41 councillors. There are two public libraries, with a total stock of 24,700 volumes, and public baths and wash-houses. Consult: Mitton, 'Holborn,' in the 'Fascination of London' series.

Islington has an area of 3,091 acres, a rateable value of £1,935,223, and an estimated population of 334,991, the largest of any London borough. The borough is almost entirely built on and only has about 40 acres of open spaces, the largest being Highbury Fields. The birth-rate is 26.6 per 1,000 and the death-rate 14.8. At the 1901 census there were 38,645 inhabited houses and 79,129 tenements. The council consists of a mayor, 10 aldermen, and 60 councillors. Through the generosity of Andrew Carnegie, who gave £40,000, there will soon be a fine system of public libraries, five in all. Up to the present only one has been opened to the public. It contains 25,000 volumes. Islington has three public baths and wash-houses. Consult: Coull, 'History and Traditions of Islington' (1864); Cromwell, 'Walks through Islington' (1835); Lewis, 'History and Topography of the Parish of St. Mary, Islington' (1842); Nelson, 'History and Antiquities of the Parish of Islington' (1823); Tomlins, 'A Perambulation of Islington' (1858).

Kensington contains Kensington Palace, the birthplace of Queen Victoria, and is called the Royal Borough of Kensington in consequence. It has an area of 2,291 acres, a rateable value of £2,395,590, and an estimated population of

179,026. The birth-rate is 20.0 per 1,000 and the death-rate 14.8. At the 1901 census there were 22,131 inhabited houses and 38,349 tenements. There are practically no open spaces, but on the western side of the Borough are Kensington Gardens, Hyde Park, Green Park, and Saint James's Park. The council consists of a mayor, 9 aldermen, and 60 councillors. There are three libraries, with a total stock of 54,558 volumes, and public baths and wash-houses. There is a certain amount of overcrowding, but the Borough contains some fine thoroughfares and a wealthy residential population. Consult: Burt, 'Historical Notices of Kensington' (1871); Faulkner, 'Kensington' (1820); Leigh Hunt, 'Old Court Suburb' (1855); Loftie, 'Kensington' (1888).

Lambeth is a long, narrow borough, extending from Waterloo Bridge to the London County boundary on the south, and contains 4,070 acres. It has a rateable value of £1,947,645 and an estimated population of 305,029. The birth-rate is 29.6 per 1,000 and the death-rate 15.7. At the 1901 census there were 41,511 inhabited houses and 70,887 tenements. There are 186 acres of open spaces, the chief being Brockwell Park. The council consists of a mayor, 9 aldermen, and 60 councillors. There are six libraries, with a total stock of 146,000 volumes; on this subject the borough owes much to the generosity of the late Sir Henry Tate and Andrew Carnegie. The public baths are among the finest of their kind, and were opened by the King in 1897. Consult: Allen, 'History of Lambeth' (1826); Hill, 'Electoral History of the Borough of Lambeth' (1879); Honey, 'Origin and Duties of Overseers of Lambeth for 300 Years' (1900); Tanswell, 'History of Lambeth' (1858).

Lewisham is the third largest of the London boroughs, containing 7,014 acres. It is very sparsely populated, only about 20 to the acre. The estimated population is 148,419 and the rateable value £1,061,059. The birth-rate is 26.2 per 1,000 and the death-rate 11.4. At the 1901 census there were 22,750 inhabited houses and 27,701 tenements. The borough is well off for open spaces, of which there are 266 acres, the principal being a portion of Blackheath (144 acres) and the Hilly Fields. The council consists of a mayor, 7 aldermen, and 38 councillors. There are five public libraries, with a stock of 51,886 volumes; and public baths. Consult: Hasted, 'History of Kent and the Hundred of Blackheath.'

Paddington has an area of 1,356 acres, a rateable value of £1,540,140, and an estimated population of 150,367. The birth-rate is 22.7 per 1,000 and the death-rate 14.0. At the 1901 census there were 17,624 inhabited houses and 33,661 tenements. There are 132 acres of open spaces, principally taken up in Kensington Gardens, of which 102 acres are in the borough. The council consists of a mayor, 9 aldermen, and 58 councillors. Before the London Government Act the district of Queen's Park was a detached part of Chelsea, but since then it has become part of the borough of Paddington. A small branch public library was established there and kept up by Chelsea. It is now maintained by the Paddington Council, but the Libraries Acts have not been adopted for the whole of the borough, so that Paddington is

without a public library system under the Acts. In this respect it has as companions only two other London boroughs. Bethnal Green and Saint Mary-le-bone. There are two sets of public baths and one public wash-house. Consult: Bates, 'The Playground of Paddington' (1902); Robins, 'Paddington, Past and Present' (1853).

Poplar is a borough made up of the old districts of Poplar, Bromley, and Bow. It has an area of 2,328 acres, a rateable value of £839,779, and an estimated population of 169,227. The latter is very poor, and the death-rate very high. This has been reduced of recent years, but at one time the Bromley district had a death-rate of over 28 per 1,000; now it is 18.8, and the birth-rate is 34.5. The Isle of Dogs is in the borough, and this (part of the old Poplar district) is mainly occupied by docks. There is a considerable amount of overcrowding; at the census of 1901 there were 22,613 inhabited houses and 35,787 tenements. Except for a portion of Victoria Park there are only a few small open spaces. The council consists of a mayor, 7 aldermen, and 41 councillors. There are five public libraries, with a total stock of 34,351 volumes; three public baths and two public wash-houses. The borough has had its own electric lighting supply since 1900. Consult: Cowper, 'A Descriptive Account of Millwall, Limehouse, Poplar, Blackwall, and Stepney' (1853); Forrow, 'The Thames and its Docks' (1877); Simmonds, 'History of Poplar' (1870); also the publications of the Committee for the survey of the memorials of greater London.

Saint Mary-le-bone (Marry-le-bun) has an area of 1,473 acres, a rateable value of £1,957,505, and an estimated population of 130,589. The latter is gradually decreasing, a fact due to the constant taking over of dwelling houses in some of the main streets, such as Edgware Road, Oxford Street, Regent Street, etc., for other than domestic purposes. The birth-rate is 30.4 per 1,000, and the death-rate 17.6. At the 1901 census there were 13,536 inhabited houses and 31,623 tenements. There are about 372 acres of open spaces in the borough, of which 362 acres are comprised in that portion of Regent's Park and Primrose Hill which is in the borough. The council consists of a mayor, 9 aldermen, and 60 councillors. Several unsuccessful attempts have been made for the adoption of the Public Libraries Acts, in spite of an offer from Andrew Carnegie. Marylebone is one of three London boroughs in the same category, the others being Paddington and Bethnal Green. There is one building with public baths and wash-houses. The council has its own electric lighting undertaking, concerning which it has been recently involved in considerable litigation. Consult: Clinch, 'Marylebone and Saint Pancras' (1890); Smith, 'Account of the Parish of Saint Marylebone' (1833).

Saint Pancras has an area of 2,694 acres, a rateable value of £1,803,749, and an estimated population of 233,099. The class of population varies, and in some of the poorer quarters, notably Somers Town, there is considerable overcrowding. The birth-rate is 27.0 per 1,000, and the death-rate 16.9. At the 1901 census there were 23,715 inhabited houses and 57,045 tenements. There are 340 acres in open spaces, including portions of Parliament Hill, Waterlow Park, and Regent's Park. The council consists

LONDON

of a mayor, 10 aldermen, and 59 councillors. The Public Libraries Acts have been adopted, and a very fine system of libraries will shortly be inaugurated. Andrew Carnegie has promised £40,000 for buildings, and a central library and 4 branches will be erected. There are three public baths and wash-houses. The council controls its own electric light undertaking, being the first body in London to act in this direction. Consult: Clinch, 'Marylebone and Saint Pancras' (1890); Coull, 'History of Saint Pancras' (1861); Miller, 'Saint Pancras Past and Present' (1874); Palmer, 'Saint Pancras' (1870); Roffe, 'Perambulating Survey of Saint Pancras' (1865).

Shoreditch has an area of only 658 acres, and is the third smallest of all the London boroughs, the others being Finsbury and Holborn. The rateable value is £813,880, and the estimated population 116,608. Here again a gradual decrease is to be noted, owing to the proximity of the borough to the City of London. In 1861 the population was 129,364. The number of inhabited houses has also declined; in 1861 there were 17,072, while at the 1901 census there were only 12,743, and 27,031 tenements. The birth-rate is 33.3 per 1,000 and the death-rate 20.4. The district is a very poor one, there is considerable overcrowding, and a high rate of infant mortality. There are only 6½ acres of open spaces. The council consists of a mayor, 7 aldermen, and 41 councillors. Its municipal enterprise is very great. There are two libraries, with a total stock of 40,228 volumes, baths and wash-houses, dust destructor and electric light undertaking. The council has also instituted municipal costermonger's stalls. Consult: Ellis, 'History and Antiquities of the Parish of Saint Leonard Shoreditch and Liberty of Norton Folgate' (1798).

Southwark (South'wark, sometimes Suth'erk) is, as its name implies, the south town. It was formed by the London Government Act, 1899, from the districts of Saint Saviour's, Saint George-the-Martyr, Christ Church, and Newington. In olden times the main road from the south to the City passed through it. Locally the northern part is called the "Borough." This particular portion of the old Saint Saviour's district is remarkably rich in historical and literary associations. Southwark has an area of 1,141 acres, a rateable value of £1,305,548, and an estimated population of 202,144. Taken as a whole the district is a very poor one, and the overcrowding in the northern districts is terrible. There are huge blocks of tenement dwellings which help to give a total of 177 persons to the acre. At the 1901 census there were 20,878 inhabited houses and 47,808 tenements. The birth-rate is 32.5 per 1,000 and the death-rate 18.9. There are only 12 acres of open spaces, although Kennington Park is on the south border. The council consists of a mayor, 10 aldermen, and 58 councillors. There are 4 public libraries, and a fifth one, the gift of Andrew Carnegie, is in process of erection. The total stock of volumes is 72,000. There are two public baths and wash-houses. The electricity supply is in the hands of the council, but it has been the cause of much criticism. There is a market, known as the Borough Market, formerly owned by the Saint Saviour's district, the profits of which (£5,000 per annum) go to the relief of the rates in that

part of the Borough. In like manner £8,000 per annum goes to the relief of the Newington district, from the Walworth Common Estate. The borough contains two cathedrals—one Church of England, and one Roman Catholic. The former was the ancient parish church of Saint Saviour's, and is situated near London Bridge. It contains a fine window presented by Mr. Choate. John Harvard was born in the Saint Saviour's district—the house has been recently demolished. Consult: Besant, 'South London' (1899); Boger, 'Bygone Southwark' (1895); Bowers, 'Sketches of Southwark, Old and New' (1903); Manning and Bray, 'History of Surrey' (1804-1805); Rendell, 'Old Southwark and its People' (1878); Rendell and Norman, 'The Inns of Old Southwark' (1888); Thompson, 'Southwark Cathedral: Its History and Antiquities' (1907).

Stepney was formed from the districts of Mile End, Limehouse, Saint George-in-the-East, Whitechapel, and Stepney. It has an area of 1,766 acres, a rateable value of £1,501,782, and an estimated population of 293,318. The overcrowding is very great, there being on an average 170 people to the acre. At the 1901 census there were 31,462 inhabited houses, and 61,113 tenements. The neighborhood is extremely poor, and is the headquarters of the Jewish and other aliens, many of whom are engaged in the tailoring trades. The population is increasing, although the number of houses is decreasing. The birth-rate is 37.6 per 1,000 and the death-rate 18.8. There are only 48 acres of open spaces altogether in the borough. The council consists of a mayor, 9 aldermen, and 60 councillors. There are 4 libraries, and a handsome addition has recently been made to that at Mile End, by the generosity of Andrew Carnegie. The total stock is 64,038 volumes. There are public baths and wash-houses. The history of Stepney has not been written separately. It will be found in the general histories of London.

Stoke Newington was, until 1894, a part of Hackney. In that year a separate vestry was created. As a result of the London Government Act of 1899, a portion of South Hornsey was added to it. Even now, though, it only has an area of 863 acres. The rateable value is £352,976, and the population estimated at 52,353, the smallest of any London borough. The birth-rate is 21.0 per 1,000, and the death-rate 13.2. At the 1901 census there were 7,717 inhabited houses and 11,824 tenements. There is very little overcrowding. The borough contains a large area of open spaces, including Clissold Park (57 acres). Finsbury Park (115 acres) is on its borders. The council consists of a mayor, 4 aldermen, and 30 councillors. There is one public library, with a total stock of 30,200 volumes. Public baths are in process of erection. There is no separate history of this borough.

Wandsworth is the largest borough in London, but later on it may be divided. There are 9,108 acres in the borough, nearly 14½ square miles. The district includes Putney, Wandsworth, Clapham, and Streatham. It has a rateable value of £2,024,307 and an estimated population of 275,000. Speaking generally the inhabitants are well-to-do, there is little or no overcrowding, and a low death-rate. The latter is 13.0 per 1,000, while the birth-rate is 27.0. At

LONDON

the 1901 census there were 37,764 inhabited houses and 49,756 tenements. The borough contains a large area of open spaces, the total being 1,163 acres, including parts of Clapham and Wandsworth Commons, all Tooting and Streatham Commons, and Putney Heath. The council consists of a mayor, 10 aldermen, and 59 councillors. There are six public libraries, with a total stock of 50,448 volumes. In the Wandsworth section of the borough, there are public baths, which cost £40,000, and were opened in 1901. Consult: Arnold, 'History of Streatham' (1886); Grover, 'Old Clapham' (1887); Coward, 'Wandsworth and Putney'; with a 'Chapter on Pre-Historic Age' by G. F. Lawrence (1893); Hammond, 'Bygone Wandsworth' (1896), and 'Bygone Putney' (1898); Jackson, 'Putney: Past and Present' (1883); Mitton and Geikie, 'Putney, Hammersmith and Fulham' in 'Fascination of London' Series (1903); Morden, 'History of Tooting Graveney' (1897); Rudolf, 'Clapham before 1700 A.D.' (1904).

Westminster has the highest rateable value of any municipality in London, not excepting the City of London itself. It contains 2,503 acres, the rateable value is £5,960,099, and the estimated population is 174,271. By a special Royal Charter, granted by the late Queen, Westminster is a city. It was formed, by the London Government Act of 1899, from several other districts—Westminster, Saint George-Hanover Square, Saint Martin-in-the-Fields, etc. The birth-rate is 16.9 per 1,000 and the death-rate is 15.5. At the 1901 census there were 18,366 inhabited houses and 41,244 tenements. There are 723 acres of open spaces, nearly one-third of the whole city, including Hyde Park, Saint James's Park, the Green Park, and part of Kensington Gardens. In the city are also situated all the Government offices, Buckingham and Saint James's Palaces, Marlborough House, the Imperial Institute, the South Kensington Museums, Westminster Abbey, the Houses of Parliament, etc. One of the finest houses in the most fashionable part of London—Park Lane—is that rented by the present American Ambassador, Mr. Whitelaw Reid.—Dorchester House. The council consists of a mayor, 9 aldermen, and 59 councillors. There are five public libraries, with a total stock of 116,000 volumes. There are also five public baths. Consult: Besant, 'Westminster' (1895); Terry, 'Greater Westminster' (1899); Walcott, 'Westminster' (1849), in addition to the general history of London.

Woolwich (Wool-itch) is composed of three districts—Woolwich, Plumstead, and Eltham. It has an area of 8,277 acres (second only in size to Wandsworth), a rateable value of £782,901, and an estimated population of 127,345. Large districts are not yet built upon, the average being only 15 persons to the acre. The birth-rate is 30.4 per 1,000 and the death-rate 14.4. At the 1901 census there were 18,086 inhabited houses and 24,585 tenements. There are 355 acres of open spaces, the principal being Plumstead Common, Borstal Heath and Woods, Woolwich Common, and Eltham Common. The council consists of a mayor, 6 aldermen, and 35 councillors. There are three public libraries. The total stock of books is 75,000. The public baths are well patronized. Consult: Larking,

'The Domesday Book of Kent' (1859); Vincent, 'Records of Woolwich' (1890).

HENRY D. ROBERTS,
Geographical Editor for Great Britain.

London, Ohio, village, county-seat of Madison County; on the Pittsburg, C., C. & St. L. and the Cleveland, C., C. & St. L. R. R.'s; about 26 miles southwest of Columbus and 65 miles northeast of Cincinnati. It is situated in an agricultural region. The manufactures are agricultural implements, lumber, shoes, and cigars. The village owns and operates the electric-light plant. Pop. (1900) 3,511.

London, Canada, city in the County of Middlesex, Ontario, at the junction of the north and south branches of the Thames River, midway between Niagara Falls and Windsor, about 23 miles north of Lake Erie; and on the Grand Trunk, the Canadian Pacific, the Michigan Central, and the Père Marquette R. R.'s. The principal manufactures are stoves, church furniture, car works, lumber products, chewing gum, featherbone for corsets, cigars (about 20 factories), clothing, agricultural implements, carriages, electrical machinery and supplies, shoes, iron rolling mills, flour mills, cigar boxes, printing and lithographing plants, and cement products, such as brick, tile, etc.

The principal institutions are the Western University, the Academy of the Sacred Heart, the Provincial Asylum for the Insane, Victoria and Saint Joseph's Hospitals, two orphanages (Protestant and Catholic), the Children's Aid Society Shelter for Friendless Children, the Aged People's Home, Home for Incurables, Y. M. C. A., Public Library, Conservatory of Music, and Harding Hall, a college for young ladies. London is the diocesan headquarters of the Roman Catholic Church and the Church of England. It has two cathedrals—Saint Paul's (Anglican) and Saint Peter's (Roman Catholic)—and 32 churches of various denominations.

There are branches of 10 chartered banks and several loan companies in the city. About 30 public and separate (Catholic) schools, and a Collegiate Institute, accommodate a school population of about 8,000. The city is governed by a mayor and twelve aldermen, elected for one year. Pop. (1906) 43,000.

London Bridge, A celebrated bridge connecting the city of London with the Borough. It was designed by John Rennie and built by his sons (1825-31). Its dimensions are as follows: length, 928 feet; width, 54 feet; height above the river, 56 feet. An immense traffic passes over the bridge daily. The present structure took the place of a stone bridge (completed 1209), which was a short distance farther down the river.

London Clay, in geology and paleontology, a formation of the Lower Eocene Age; so called from its existing at or near London, England. It consists of a tenacious brown and bluish-gray clay, with layers of concretions called septaria. It has a maximum thickness of 600 to 700 feet.

London, Treaties and Conventions of. The following are the most important of the treaties and conventions concluded in London in modern times. The Quadruple Alliance, formed 2 Aug. 1718. On 6 July 1827, a treaty

LONDON UNIVERSITY — LONDONDERRY

was signed between England, France, and Russia for regulating the affairs of Turkey and Greece, which led to the establishment of the Kingdom of Greece. On 22 April 1834, a quadruple alliance was formed between England, France, Spain, and Portugal against the claims of Don Carlos and Don Miguel to the crowns of Spain and Portugal. On 15 July 1840, a treaty was concluded between England, Russia, Austria, and Prussia to compel Mehemet Ali to restore Candia and Syria to the Porte; and on 27 November, at the conclusion of a short campaign by an Anglo-Austrian army in Syria, Mehemet Ali agreed to the terms of the treaty. A convention to close the Dardanelles against ships of war was signed on 13 July 1841; and a co-vetention between France and England for suppression of the slave-trade, 29 May 1845. Austria, France, England, Prussia, Russia, and Sweden were parties to a treaty signed 8 May 1852, for settling the succession to the Danish crown, and guaranteeing the integrity of its dominions in relation to the duchies of Schleswig-Holstein. The rights of the German Confederation were reserved and the claims of the Duke of Augustenburg on the duchies relinquished on satisfaction. On 13 March 1871, at a conference of the great powers, the neutralization of the Black Sea, effected by the treaty of 1856, was abrogated. The neutralization of Luxemburg was guaranteed by the five powers at the conference of London, 11 May 1867. The Convention of London, which was concluded on 27 Feb. 1884, between the Transvaal and Great Britain, abrogated the Pretoria Convention of 3 Aug. 1881, and instead gave the Transvaal (thenceforward to be known as the South African Republic) independence in regard to its internal affairs, but reserved to the queen the right of veto over all treaties concluded "with any state or nation other than the Orange Free State," or "any native tribe to the eastward or the westward of the Republic."

London University, England, established as a joint-stock company in 1825, received in 1836 two charters, one for an association retaining the name of London University, and having power to examine candidates and grant degrees, and the other for a teaching body—the University College—entitling it to prepare students for the degrees conferred by the university. The object was to render academic honors accessible to all classes and denominations without distinction. The university became purely an examining body, granting degrees to all who passed the prescribed examinations, but not undertaking any teaching functions. An influential movement in favor of the establishment of a teaching university in the metropolis arose, however, and from 1888 commissions had the matter in hand, and in 1898 the London University Act was passed to give effect to their recommendations. A commission appointed to draw up statutes and regulations for the university in accordance with the act had its work formally ratified 29 June 1900, and the newly constituted university was established, the government granting the eastern and central portions of the Imperial Institute building to the university for its accommodation.

The eight faculties comprise arts, science, law, medicine, theology, music, engineering, and economics and political science, and the degrees

conferred are LL.D., LL.B., M.D., M.B., M.S., B.S., D.Sc., B.Sc., D.Lit., M.A., B.A., D.Mus., B.Mus. Candidates for any degree must first pass the matriculation examination, for which the subjects are Latin, English, mathematics, general elementary science, and one other subject selected from a prescribed list, including Greek, French, German, Sanskrit, Arabic, elementary mechanics, chemistry, sound, heat and light, magnetism and electricity and botany. For the ordinary degrees of B.A. and B.Sc. two other examinations must be taken. In the faculty of arts the highest degree is Doctor of Literature. Examinations are held at provincial centres as well as in London. The schools of the University, or institutions in which instruction is given, are: University College and King's College in all faculties; Hackney College, New College, Regent's Park College, Cheshunt College, Wesleyan College (Richmond), London College of Divinity in theology; Royal Holloway and Bedford Colleges in arts and science; the Royal College of Science; the South-Eastern Agricultural College, Wye; the medical schools of St. Bartholomew's, the London, St. Thomas's, St. George's, the Middlesex, St. Mary's, Charing Cross, and Westminster Hospitals, the London School of Medicine for Women; the Central Technical College of the City and Guilds Institute; and the London School of Economics and Political Science.

The supreme governing body is the Senate, consisting of the chancellor, 4 members appointed by the crown, 17 members elected by Convocation, 1 of them being the chairman of Convocation, 2 each elected by the Royal Colleges of Physicians and of Surgeons, 1 appointed by each of the four Inns of Court, and 2 by the Incorporated Law Society, 2 each chosen by University and King's Colleges, 1 representing the Corporation of London, 2 appointed by the London County Council, 1 representing the City and Guilds Institute, and 16 elected by the faculties. The Senate is debarred from imposing any religious test, or from imposing any disability on the ground of sex. There are three standing committees of the Senate, namely, the Academic Council, the Council for External Students, and a board to promote the extension of university teaching. The Chancellor, Vice-Chancellor, and Chairman of Convocation are *ex-officio* members of all three committees. Convocation consists of the Chancellor, the Vice-Chancellor, the members of the three standing committees, and the registered graduates of the university of prescribed standing. The parliamentary representative of the university is elected by the duly qualified male members of Convocation.

Londonderry, Charles William Stewart Vane, 3d MARQUIS OF, British military officer and diplomat: b. Dublin, Ireland, 18 May 1778; d. London 6 March 1854. He served under Sir John Moore and Sir A. Wellesley, in the Peninsula, distinguishing himself there at Talavera and other battles, and was English ambassador to Berlin in 1813. He was ambassador to Vienna the next year, and minister-plenipotentiary at its Congress in 1815. By his marriage with Miss Vane he succeeded to immense estates in the county of Durham, and devoted himself to their improvement and to the welfare of his tenantry. Under his original name of Stewart

LONDONDERRY — LONG

he wrote the 'History of the Peninsular War' (1808-13); 'Narrative of the War in Germany and France, 1813-4' (1830); and edited the 'Correspondence' of Viscount Castlereagh, his brother (1850).

Londonderry, Ireland, a city, seaport, county borough, and assize town, in the county of the same name, province of Ulster, on the Foyle, 23 miles from its mouth and 124 miles by rail north-northwest of Dublin. Waterside, a suburb on the opposite river bank, is united to the city by the iron Carlisle Bridge, 1,200 feet long. The houses of the town rise on the hill tier upon tier, while the summit is crowned by the cathedral. The ancient portion of the city is surrounded by a wall 1,708 yards long. It contains a small square, called the Diamond, from which four main streets diverge. The walls are pierced by seven gates, giving communication with other parts of the town, the greater part of which lies outside the walls. The most important public buildings are the guildhall, the county court-house, the post-office, the custom-house, the harbor offices, the jail, Gwynn's Institution, the model school, Magee College, Foyle College, St. Columb's College, the school of science and art, the lunatic asylum, and Ebrington Barracks. The harbor is commodious, and vessels of large tonnage can discharge at the quay, which extends for nearly two miles along the river, and is provided with a graving-dock. An extensive foreign, colonial, and coasting trade is carried on with English and Scotch ports, while Glasgow transatlantic steamers call three or four times a week at the mouth of the river. The principal export is agricultural produce; the chief imports are timber, grain, iron, coal, flax-seed, flour, and guano. Shirt factories employ thousands of workers, and there are timber-mills, grain-mills, foundries, coach-factories, bread and biscuit factories, distilleries, and a ship-building yard. Intermediate education is supplied by Foyle College, founded in 1677, and by St. Columb's Catholic College. Magee College opened in 1865, besides teaching secular subjects, has a theological course adapted to young men studying for the Presbyterian ministry. The Protestant cathedral is inferior to many parish churches in England. The Roman Catholic cathedral is a massive and magnificent structure, opened in 1873. The population is about equally divided into Roman Catholics and Protestants. Derry originated in a monastic establishment founded by St. Columba in the 6th century. It remained an ecclesiastical settlement until 1566, when it was occupied by the English in their wars with the O'Neills of Ulster. In 1608 the place was burned and the English governor slain by Sir Cahir O'Dogherty, one of the Irish chiefs of Donegal. During the 20 years that followed, the corporation of London, who obtained a grant of the place from James I., rebuilt the city, surrounded it with a wall, fortified it with cannon, and gave it a new name. Henceforth it was known as Londonderry. Here the Protestants of Ulster took refuge at the revolution, and held the fortress against the forces of James II., the siege lasting from April till August 1689; the defense by untrained men against superior numbers being regarded as one of the most heroic and successful military actions of modern times. Pop. (1901) 39,873.

Lone Star State, **The**, a name given to Texas from the device on its coat of arms: one star, or a "lone star" in the centre of a wreath.

Lone Wolf (GUIPAGO), a noted Indian chieftain of the Kiowa tribe: d. 1879. He became head chieftain of his tribe in 1866 but refused to bring the tribe into a reservation, in accordance with the Medicine Lodge treaty which he had refused to sign in 1867. General Custer after the battle of Washita had secured possession of Lone Wolf and Satanta and threatened to hang them both unless they consented to bring in their tribe, and this they finally consented to do in the spring of 1869. Lone Wolf, however, continued to maintain an attitude of defiance and in 1872 headed a delegation of his tribesmen to Washington to adjust their difference, but about this time his son and nephew were killed in Mexico while raiding and Lone Wolf immediately set out for Mexico at the head of a small party to secure their bodies and inflict vengeance on their slayers. Upon his return he headed the warlike portion of his tribe in the southern outbreak of 1874, the first battle with the troops taking place at the agency at Anadarko on 22 August. The outbreak was finally quelled by General MacKenzie in the spring of 1875; Lone Wolf, with the other chiefs one by one surrendered and were held prisoners at Fort Marion, Fla., from 1875 until May 1878, when those surviving were returned to their tribes.

Long, Charles Chaillé. See CHAILLÉ-LONG, CHARLES.

Long, Crawford W., American physician: b. Danielsenville, Madison County, Ga., 1 Nov. 1815; d. Athens, Ga., 16 June 1878. He was graduated from Franklin College, Pa., in 1835, and from the Medical School of the University of Pennsylvania in 1839, and after practising a short time in Jefferson, Ga., removed to Athens, Ga., in 1851. He claimed to have performed on 30 March 1842 the first surgical operation ever made while the patient was unconscious from inhaling ether. This appears to have been done in accordance with careful reasoning upon the subject, but although he repeated the experiment successfully in three other cases not far from that time the facts did not then become generally known. In December 1844 Dr. Horace Wells in Boston demonstrated practically the principle of anaesthesia by the use of nitrous-oxide gas, and in 1846 W. T. G. Morton followed him in a similar discovery, and publicly demonstrated the feasibility of employing anaesthetics in surgical operations. In 1902 the Georgia Medical Association proposed to place a statue of Long in the National Capitol as the discoverer of anaesthesia. See ANAESTHESIA.

Long, Eli, American general: b. Woodford County, Ky., 16 June 1837; d. New York 1903. He was graduated from the military academy at Frankfort, Ky., in 1855, and received an appointment as 2d lieutenant in the 1st United States cavalry, serving in the Cheyenne expedition in 1857. During the Civil War he was in active service in the Federal army, was several times wounded, and was brevetted brigadier-general of volunteers in August 1864. He captured Selma, Ala., in April 1865. He was mustered out of the volunteer service in 1866 and retired as major-general. For many years previous to his death he had lived in Plainfield, N. J.

LONG—LONG ISLAND

Long, George, English classical scholar: b. Poulton, Lancashire, 1800; d. 10 Aug. 1879. He was educated at Cambridge and was professor of classical literature in the Brighton Proprietary College 1849-71. He was famous for his thorough knowledge of Latin and Greek literature. He published admirable translations of 'Thoughts of the Emperor M. Aurelius Antoninus' (1862-79) and 'Discourses of Epicuretus' (1877); as well as editions of Cæsar, Salust and Cicero.

Long, John Davis, American lawyer and politician: b. Buckfield, Oxford County, Maine, 27 Oct. 1838. He was graduated from Harvard in 1857; taught in Westford Academy for two years; then studied law at Harvard law school and was admitted to the bar in 1861. He built up a large practice and became senior member of his firm, Long & Hemenway. He has been an active member of the Republican party; served in the Massachusetts legislature 1875-8, being speaker of the House from 1876-8, and was elected lieutenant-governor of the State in 1879; the next year he was elected governor, and re-elected in 1881. He was also for several years on the state house construction commission of the State. In 1883 he was elected to Congress, serving there till 1889; he was then a candidate for the Senate but was defeated, and did not hold public office till appointed secretary of the navy by President McKinley in 1897. He held this office through the Spanish War, conducting its affairs with marked ability, and resigned in March 1902. He published in 1879 a translation of the 'Æneid' of Virgil.

Long, Stephen Harriman, American engineer: b. Hopkinton, N. H., 30 Dec. 1784; d. Alton, Ill., 4 Sept. 1864. He was graduated at Dartmouth College in 1809, and after teaching school entered the United States engineer corps in 1814. He taught mathematics at West Point 1814-16, and was subsequently engaged for several years in surveys of the country west of the Mississippi River, as well as of the Upper Mississippi. Long's Peak in the Rocky Mountains was named in his honor. When the construction of the Baltimore & Ohio railroad was commenced in 1827 Long became chief engineer of surveys and introduced many improvements in wooden bridges, to adapt them for railroad purposes. In the construction of railroads he established a system of curves in locating roads. He served for some years on the board for the improvement of the Mississippi, and in 1856 was placed in charge of that work. He was appointed colonel of engineers in 1863, retiring the same year.

Long, William Joseph, American Congregational clergyman and author: b. North Attleboro, Mass., 3 April 1867. He was graduated from Harvard in 1892 and from the Andover Theological Seminary in 1895. He is the author of: 'The Making of Zimri Bunker' (1898); 'Ways of Wood Folk' (1899); 'Wilderness Ways' (1900); 'Beasts of the Field' (1901); 'Fowls of the Air' (1901); 'Secrets of the Woods' (1901); 'School of the Woods' (1902); 'Following the Deer' (1903); 'A Little Brother to the Bear' (1903).

Long Branch, N. J., city, in Monmouth County; on the Atlantic Ocean, and on the

Pennsylvania, the New Jersey S., and the Central of New Jersey R.R.'s; about 35 miles by water, 45 miles by rail, and 30 miles in direct line south of New York city. During the summer season steamers run regularly several times a day between New York and Long Branch, and electric lines connect the nearby cities and towns with this famous summer resort. Long Branch is made up of large hotels, boarding houses, cottages, bathing houses, parks, stores, and places of amusement. It is well prepared to take care of the thousands of people who visit the place in the hot summer months. It has 16 churches, the Star of the Sea Academy, public schools, the Monmouth Memorial Hospital, a circulating library, and public reading rooms. The avenue along the bluff is a favorite walk. The long beach affords excellent bathing facilities. Large bulkheads have been erected to prevent destructions of the bluff by the action of the waves. The government is vested in a commission composed of seven members, who choose the mayor from among the number. Four of the commissioners are elected by wards, three at large, and all are elected annually. There are three banks with a combined capital of \$200,000.

Long Branch is one of the oldest summer resorts in the United States. As early as 1670 settlements had been made along the coast. Colonel White of the British army, who owned the land where Long Branch is located and in the vicinity, about 1770, used to spend his summer months at this place. After the Revolution people from Philadelphia began to visit the place during the hot months, and in the last of the 18th century it had quite a reputation as a summer resort. Prior to its occupancy during the summer by people from New York and Philadelphia, it was frequented by fishermen and wreckers. Its proximity to New York, Philadelphia, and other cities gives it a large number of guests during the season. Pop. (1900) 8,872.

CHAS. L. EDMONDS,
Editor of Long Branch 'Record.'

Long Island, New York, the southeasternmost portion of the State, connected by three bridges and several ferries across East River with Manhattan Island; is bounded on the north by Long Island Sound (q.v.), separating it mainly from the south shore of Connecticut. The Atlantic Ocean bounds it on the east and south, while The Narrows, New York Bay, and East River, already mentioned, connecting the ocean with the Sound, complete the boundaries on the west and northwest. Several small islands around the coasts are included in its political boundaries, the best known being Coney, Rikers, Berrian, South Brother, Fire, Barren, Shelter, Gardiner, Fisher, and Plum. Long Island has a maximum length of about 120 miles, varies in width from 12 to 23 miles, and has an area of 1682 square miles. It is divided into four counties, Nassau, Suffolk, Queens, and Kings, the last two metropolitan boroughs of New York city, occupying a considerable portion of the western end of the island. Queens County embraces the populous centres of Long Island City (q.v.), Maspeth, Corona, Flushing, Jamaica, Woodhaven, and Far Rockaway, while the boundaries of Kings County are those also of the former city, now the metropolitan borough, of Brooklyn (q.v.).

LONG ISLAND

The 280 miles of coast line are indented with numerous bays and inlets. A deep bay, 30 miles long, divided into Great and Little Peconic, and Gardiner's bays, splits the eastern end of the island into two long narrow peninsulas, the southern terminating at Montauk Point, and the northern at Orient Point, with Plum and Fishers islands extending beyond. Great South Bay, from two to five miles broad, extends along the southern coast for nearly half the length; it is separated from the Atlantic Ocean by Fire Island or Great South Beach, a sandy strip from a quarter of a mile to one mile wide, communicating with the ocean by several openings. Jamaica Bay is on the south coast also, New York Bay on the west, while along the north coast are Flushing, Little Neck, Manhasset, Hempstead, Oyster, Huntington and Smithtown bays. A government system of lighthouses, life-saving stations, fortifications, and masked batteries extends around the coast.

The level seacoast of the south side, with its extended views of bay and the broad ocean, contrasts sharply with the hilly north side and its deep indentations, looking out upon the landlocked Sound. The rolling stretches of Montauk Point and Shelter Island afford another contrast to the many square miles of scrub oak and level sandy plains in the centre of the island. The island reaches a height of over 380 feet in West Hill, Suffolk County, and in Harbor Hill at Roslyn, the loftiest points in the range of glacial hills that extends along the northern coast. The island is well watered by several small streams, the Peconic, 15 miles long, flowing into Great Peconic Bay, being the largest. Natural ponds or lakes abound, and there are about 116 square miles of salt marsh throughout the island. The eastern portion especially is well wooded and noted for its pine forests well stocked with deer and other game. Like other insular positions the climate is milder than that of the adjacent continent, the average temperature being several degrees below that of the metropolis, while the hottest days are tempered by cool and refreshing breezes from ocean or Sound. The soil generally is productive and under a high state of cultivation. In the southern flat lands it is of a light, sandy nature, well calculated for raising grain, especially Indian corn; in the hilly north the soil is strong and adapted to the culture of grain, hay, and fruits. Market gardening for metropolitan demands constitutes the principal portion of the agricultural industry of Kings and Queens counties. Oyster, clam, and other fisheries are important sources of food supply.

The Long Island and other railroads give easy access from New York city to the remotest parts, Montauk Point, the southeastermost point, being only three hours away. Long Island is noted especially for exceptional opportunities, embracing all sorts of summer recreation. The roadways are admirably adapted to all forms of locomotion, and riding, driving, automobiling, and wheeling, are equally desirable methods for enjoying the region. In the numerous villages and towns along Jamaica Bay, Great South Bay, Peconic Bay and the Sound, there are ample facilities for sailing, rowing, fishing, and bathing, which are fully utilized. For golfing, lawn tennis, and all other forms of outdoor sport and recreation, every possible fa-

cility is found, and the golf courses, especially at Garden City and Shinnecock, are notable. The chief seaside resorts along the south coast are Bath Beach, Bensonhurst, Coney Island, Brighton, Manhattan, Rockaway Beach, Far Rockaway, Long Beach, Fire Island, Patchogue, and Montauk Point; along the north coast are Greenport, Port Jefferson, Coldspring Harbor, Oyster Bay, Glen Cove, Seacliff, College Point and North Beach. The population of Long Island in 1900 was 1,452,611, 1,166,582 of this number residing in Brooklyn borough.

When discovered in 1609 by Hudson, Long Island was inhabited by 13 tribes of Algonquin Indians, by whom the island was variously called Panmancke, Wamponomon, Mautowacks, and Sewanhacky. A few descendants mixed with negro blood, and retaining no knowledge of their ancient language, dwell near Montauk Point and Shinnecock Neck. French Protestants from near the river Waal, in the Netherlands, made the first settlement in 1625 under Dutch protection, and immigrants from New England established themselves in different localities shortly afterward. Lange Eylandt, the Dutch name, was changed by the colonial legislature to that of Nassau, a name which survives in one of the counties, but was never adopted by the people for the island. Long Island was a busy base of military movements during the Revolutionary War, and the Battle of Long Island (q.v.) is the principal event in its history.

Long Island, Battle of, one of the early American defeats in the Revolutionary War, was fought 27 Aug. 1776, in Brooklyn, N. Y., mainly within the present limits of Prospect Park, the column in Battle Pass to the memory of the 400 Maryland troops who fell in the battle, and the foundation remains of the redoubt on Lookout Hill, marking the central point of defense and attack. After the evacuation of Boston by the British, Washington made strenuous efforts to fortify New York and its approaches. General Greene, in command of a considerable body of troops, mostly raw recruits, was entrusted with the defense of Long Island, and constructed a line of intrenchments and redoubts from Wallabout Bay to Gowanus Cove. The main works at the Wallabout end were on the hill afterward known as Fort Greene, now marked by Washington Park. At Gowanus Cove, a battery was erected at Red Hook, and a fort on Governor's Island, nearly opposite. About two and a half miles from the intrenchments, between them and the southwest side of the island, the range of low hills in this section was then densely wooded and crossed by three roads; one on the right of the works passing near the Narrows to Gravesend Bay, the central one through Flatbush, and the third far to the left through Bedford to Jamaica. In the midst of his preparations, General Greene fell ill, and the command devolved upon General Sullivan, then just returned from Lake Champlain. Unacquainted with the ground and with Greene's plans the change of command caused considerable confusion. Nine thousand British troops landed in Gravesend Bay on 22 August without resistance; they were commanded by Sir Henry Clinton, assisted by Lords Cornwallis and Percy, General Grant and Sir William Erskine. Lord Cornwallis, rapidly advancing to the central pass, found it occupied by the rifle regiment of Colonel Hand, and without risking

LONG ISLAND CITY—LONG PARLIAMENT

an encounter, took up a position at Flatbush. Washington inspected the American lines on the 24th, and placed General Putnam in command. The following day the British were reinforced by two brigades of Hessian troops, under General De Heister, and on the 26th began to carry out their plan of operations. The road through Bedford to Jamaica unfortunately had been comparatively neglected by the Americans, and eluding the patrol, the British contingent under General Clinton, accompanied by General Howe, the commander-in-chief, and by Lords Percy and Cornwallis, guided by a local tory, gained possession of the road and neighboring heights undiscovered during the night of 26-7 August. In the morning General Grant, with the left wing of the British army, advanced along the road by Gravesend and the Narrows, and was resisted by Colonel Atlee with a guard of Pennsylvania and New York militia, who retired fighting until he had fallen back upon General William Alexander (Lord Stirling), whose two regiments had hastened to his assistance. Here active firing was kept up by both sides without an attempt at a general action. At the same time, as diversions, De Heister opened up a cannonade from Flatbush upon Colonel Hand and his riflemen, while the guns of the British war-vessels were trained upon the Red Hook battery. Meanwhile on the right Clinton opened his guns upon the Americans, and at this signal De Heister advanced to storm the central pass and the redoubt of which General Sullivan had taken command. The latter, who found his left flank engaged and himself in danger of being surrounded, ordered a retreat, but not soon enough to escape the British light infantry, who drove him back upon De Heister and his Hessians. The Americans fought with desperate valor, a large body cutting their way through the intrenchments, the rest who were not killed either escaping among the hills or surrendering as prisoners, among the latter being General Sullivan. On the left Colonel Atlee and Lord Stirling, who had maintained their position in front of General Grant, found themselves cut off by Cornwallis. They gallantly attacked the enemy with such determination that the British held their ground only by the assistance of reinforcements, when Stirling seeing the uselessness of further resistance surrendered. Having forced all the approaches the British proceeded to invest the American works.

Washington arrived in the evening and took command, the following day bringing over additional troops. But with the formidable British force opposed to him, and indications that the British fleet intended moving up the river so as to cut the force in Brooklyn entirely off, Washington, on the night of 29-30, favored by a thick mist, made a strategic and masterly retreat to Manhattan, greatly to the discomfiture of the British, who were unaware of the movement until some time after the last American had crossed in safety. The Americans lost over 900 men in the battle, while the British loss in killed wounded and missing was 400. Consult: Carington, 'Battles of the American Revolution' (1876); Dawson, 'Battles of the United States' (1858); Field, 'Battle of Long Island' (1869).

Long Island City, N. Y., formerly a city in Queens County, and second in size on Long Island, now in the borough of Queens, in New

York city. It became a part of New York 1 Jan. 1898. As early as 1640 Dutch settlers had taken possession of the land in this vicinity, and gradually a number of little villages were formed on the western end of the island, on the East River and the Sound. In 1870 a number of the little villages, Astoria, Blissville, Dutch Kills, Hunter's Point, Middletown, Ravenswood, and Steinway, were united into one municipality and called Long Island City. Newtown Creek separates this section from the borough of Brooklyn. Ferries connect it with the borough of Manhattan. It has extensive manufacturing interests, several hospitals, a large number of churches, and schools. Consult: Kelsey, 'History of Long Island City.'

Long Island Sound, a body of water which separates Long Island, in New York State, from the mainland. It is an arm of the Atlantic Ocean, extending northeast and southwest; about 110 miles long and from 10 to 25 miles wide. It is connected with the Atlantic on the east by The Race, a narrow passage south of Fishers Island; and on the west by a strait called the East River, which enters New York Bay and through the Narrows to the ocean. The coast on the north is irregular, and has a number of small bays and capes. The south or Long Island coast is irregular from East River to near Port Jefferson; and from Port Jefferson to Orient Point the coast line has few indentations. The largest indentations on the north side are New Haven Harbor and Pelham Bay. There are several good harbors at the mouths of rivers and in places sheltered by small islands. On the south shore the principal indentations are Smithtown, Northport, Oyster, Manhasset, Little Neck, and Flushing bays. The north coast is fringed by small rocky islands or reefs. In the western part of the Sound there are a number of small islands, which have been improved so as to be desirable resorts or residential locations. Chief among these are Glen Island and City Island. At the entrance to East River there are a number of islands used chiefly by the health department of New York city. At the east entrance is a group of islands which extend diagonally from Long Island to the State of Rhode Island. The largest of this group is Fishers Island. (See NEW YORK CITY.) The chief rivers which flow into the Sound, all from the north; are Connecticut, Mystic, Thames, and Housatonic.

Since the improvements made (1865) at Hell Gate (q.v.), Long Island Sound is an available route for ocean steamers. The large passenger steamers which ply daily between New York and New England ports pass through the Sound. A large number of forts with modern equipment are located along the shores, thus guarding most carefully the entrance to New York city by this route.

Long Parliament, in English history, a Parliament summoned by Charles I. in 1640. Largely liberal and anti-royal, thanks to the campaigning efforts of John Pym, it declared ship-money illegal, claimed the right of taxation as belonging solely to the Commons and not to the Crown, passed the Triennial Bill, and, attacking the King's favorites put Laud in prison and Strafford to death. In November 1641, passing successfully a reactionary crisis, it adopted the Great Remonstrance, and in January

LONG-TAILED DUCK—LONGEVITY

of the next year refused to obey the king's order to surrender "the five members," its leaders, Hampden, Pym, Hollis, Haselrigg and Strode. Thus it brought on the Civil War, through which it continued in power, losing however many members upon the introduction of Presbyterianism, and nearly 100 Presbyterians in 1648 after its attempted compromise with the king, which aroused the anger of the Parliamentary army. The handful of members left composed the "Rump," which was nominally in power until dissolved in 1653 by Cromwell, after whose death it briefly reconvened in 1659 and 1660. See CROMWELL.

Long-tailed Duck. See OLD SQUAW.

Long Tom, (1) the name given a 42-pound gun captured by the British in 1798 from the French battleship *Hoche*. It was afterward purchased by the Americans and used in the attack on Haiti by the French in 1804, and remained idle till 1812, when it was placed on the General Armstrong. This vessel ran the British blockade at New Orleans 9 Sept. 1814, and put into the bay near Horta, Fayal, being disabled in an encounter with a British squadron. Here the gun was dismantled and remained till Colonel Reid, son of the commander of the General Armstrong, had it brought back to New York 18 April 1893. (2) An apparatus for washing gold from the earth or gravel in which it is found. It consists of a wooden trough, from 12 to 25 feet long and about a foot wide. At its lower end it widens, and its floor there is of sheet-iron pierced with holes half an inch in diameter, under which is placed a flat box a couple of inches deep. A stream of water is kept running through it by means of a hose; the dirt is shoveled in, and stirred at the lower end, where the earth and gravel fall through the sieve into another box, where they are again sifted. The machine, like the "rocker," was cheap and wasteful; and both were soon displaced by the sluice.

Longacre, James Barton, American engraver: b. Delaware County, Pa., 11 Aug. 1794; d. Philadelphia 1 Jan. 1869. He was apprenticed in Philadelphia, and in 1819-31 was employed in the illustration of many of the foremost American works then published. At first with James Herring, and later independently, he published the 'National Portrait Gallery of Distinguished Americans' (1834-9), many of whose engravings were from sketches by himself. In 1844 he was appointed engraver to the United States mint, and from that time until his death designed all new coins. He also remodeled the coinage of Chile.

Lon'gan, a tree and its fruit. See LITCHI.

Longard de Longgarde, Dorothea. See GERARD DOROTHEA.

Longchamps, lôn-shôn, Paris, France, a celebrated racecourse on the southwest side of the Bois de Boulogne, where the race for the "Grand Prix" is run. Prior to its suppression in 1792, part of the site was occupied by the Convent of Longchamps, founded in 1260, a not too rigid retreat for ladies of the higher classes. It was a popular resort for carriage driving, especially during the week preceding Easter.

Longe, a local name (Vermont) for the lake trout (q.v.).

Longevity, lôn-jév'i-ti. The duration of life varies greatly in the same group of plants and animals, and great age in animals is by no means confined to the few higher vertebrates, such as the elephant, crocodile or parrot. Even so lowly an organism as the sea-anemone has been kept alive for 55 years. Low herbaceous annual plants in the temperate zone, have co-species in the tropics which grow to be trees and are perennial. Not only are individuals of a species long-lived, but certain species and genera exhibit wonderful vitality and have persisted throughout many geological ages, such are *Lingulella*, *Limulus*, *Ceratodus*, and certain foraminifers which have persisted since the Silurian period.

Causes of Longevity.—They have to do with the nature of the physical surroundings, and also depend on slow growth and late reproduction. Botanists find that great age in plants is dependent on slow growth, gradual propagation carried on late in life, on the solidity and hardness of the tissues, etc. Examples of great age in plants are the Sequoias or "big trees" of California, which are supposed to be over 3,000 years old; in fact, they are survivors of Tertiary times, since they occur in a fossil state in the polar regions in British Columbia and in Europe.

The longevity of certain species of animals has been attributed by Weismann to favorable environment, including temperature. He considers that the duration of life depends first upon the length of time which is required for the animal to mature, and upon the length of the period of fertility, the latter point being determined by external conditions. Undoubtedly another factor is heredity, since longevity is directly transmissible from parent to offspring, and great age runs in families.

As to longevity in the lower animals little is known. As a rule, they live but a few weeks, months, or years. The crayfish is said to attain an age of 20 years, and possibly the lobster may live to be as old as that. Lampreys preserved in Roman fish-ponds are said to have lived to be nearly 60. The crocodile, which never stops growing through life, lives 100 years. Pike and carp reach the age of 150 years. A gigantic salamander of Japan lived at least 52 years in confinement in Germany. As to the age of birds a writer in the British ornithological journal 'Ibis,' states that the following records of birds in captivity are authentic: raven 50, gray parrot 40 and 50, blue macaw 64, eagle-owls 53, and one was then still alive at 68 years. Certain aquatic birds are very long-lived, as a heron of 60, goose 80, mute swan 70. A goose still living in Rhode Island in 1903 is known to be 50 years of age. To what age in free nature these birds may reach is unknown. The elephant is known to live a century and the whale is supposed to be equally long-lived. The horse rarely reaches the age of 40, though according to Lawrence "Old Billy" of Manchester was known to have lived 59 years, and died at the age of 61, while Albertus, an old veterinarian, writes that he knew a soldier actually serving upon a horse which was 70 years of age.

Man sometimes reaches the age of 100 years, and in rare instances even exceeds that age; while heredity undoubtedly has most to do with great age, it may be promoted in those of medium height by quiet, regular habits, moderation in eating and abstinence from or moderation in

LONGFELLOW

the use of stimulants and tobacco. Women attain a greater age than men. To show that in man the mean duration of life may be extended by good sanitation and improvement in the general conditions of life, the mean duration of life in France has risen from 20 years at the close of the 18th century to 40 years. The United States census report for 1900 on deaths that occurred in 271 cities of 5,000 population or more shows that 18.6 persons died in 1900 out of every 1,000, whereas in 1890 the number who died in the same cities was 21 out of every 1,000. The average age at death in 1890 was 31.1 years; in 1900 it was 35.2 years. If these statistics be accurate the saving of human life that has been achieved in a decade is enormous. Consult: Weismann, 'Essays upon Heredity, etc.' (Oxford 1889); Lankester, 'On Comparative Longevity in Man and the Lower Animals' (London 1870); Lolaville, 'The Duration of Human Life,' in the 'Popular Science Monthly,' Vol. XX., November 1881.

Longfellow, Ernest Wadsworth, American artist; b. Cambridge, Mass., 1845. He studied under Couture in Paris, and among paintings by him may be named: 'Italian Pines'; 'Misty Morning'; 'John and Priscilla'; 'Old Mill at Manchester'; and a portrait of his father, Henry W. Longfellow, the poet.

Longfellow, Henry Wadsworth, American poet; b. Portland, Maine, 27 Feb. 1807; d. Cambridge, Mass., 24 March 1882. He was the second son of Stephen Longfellow, lawyer and congressman, and Zilpah, daughter of Gen. Peleg Wadsworth—thus coming from excellent stock on both sides. He seems to have combined the best characteristics of both parents and to have passed an ideal kind of childhood in the beautiful seaport town. His disposition was gentle, sympathetic, and studious, and his education was such as to bring out his finest qualities. He was encouraged to read the best English poetry and early began to write verses on his own account, doubtless finding in the success of his favorite volume, Irving's 'Sketch-Book,' encouragement to believe that a bright future lay in store for American writers.

In 1822 he entered Bowdoin College, of which his father was a trustee. He continued to lead much the same wholesome life he had led at home, avoiding rough sports, showing a chivalrous regard for women, especially his mother, reading and writing poetry, and performing faithfully his academic duties. Some of his poems were published in *The United States Literary Gazette*, of Boston, and brought him in a tiny sum of money besides an amount of notice altogether out of proportion to their merits. He also gave much thought to the choice of a profession, and, rejecting the law and, despite his piety and attachment to his faith, the Unitarian ministry, he fixed his mind upon the calling of a man of letters. His father prudently did not altogether thwart him, and soon another but not alien calling offered itself. He stood so well in his class—of which Nathaniel Hawthorne (q.v.) was a member—that the trustees proposed to him that he should go to Europe to fit himself to be the first incumbent of a chair of modern languages they had determined to establish. Their offer was

accepted, and after a few months of study at home he sailed for Havre, landing there on 15 June 1826.

His friend George Ticknor (q.v.) had advised him to get all he could from the systematized scholarship of Germany, but Ticknor was in advance of his fellow countrymen, and Longfellow wisely followed his own instinct to steep himself in the color and movement and romance of the old world's life and literature. He was not idle—for in France, Spain, Italy, and Germany he cultivated his exceptional linguistic gifts and prepared himself for the main duties of his chair; but the end he proposed to himself was plainly culture, not scholarship. It was old-world culture and romance that the new world needed, and these Longfellow later showed that he could transmit even better than Irving had done, and much better than his light-hearted contemporary N. P. Willis (q.v.) was to do. Although his popular reputation will always be that of a poet, Longfellow's important place in the history of American literature is partly due to his eminent services as a translator and a transmitter of culture.

Although very young, the traveller made friends everywhere, both with natives and with fellow Americans, and although his precocious Muse was singularly silent for some years, he laid up a valuable stock of poetic impressions. There was a slight hitch with regard to his professorship, but this was overcome and he returned to America in August 1829 and entered upon his duties at Bowdoin. These he fulfilled with great success, acting also as librarian. He translated and edited textbooks for his students, with whom he always stood in friendly relations, he prepared his lectures carefully, he wrote articles for *The North American Review* on topics of foreign literature, and he published, in another magazine, sketches of travel, which were collected in 1835 under the title of 'Outre-Mer.' It was a quiet and useful life and one that was rendered still happier by his marriage in September 1831 to Miss Mary Storer Potter, of Portland.

A little over three years later he was invited to succeed Ticknor as Smith Professor of Modern Languages at Harvard, with the intimation that he would do well to spend some months in Germany before beginning his work. He sailed with his wife in April 1835, and spent the summer in Sweden and Denmark, studying the Scandinavian literatures, which were destined to have a strong influence upon his writings. In the autumn Holland was visited, and there at Rotterdam, after a protracted illness, his young wife died. Much affected, Longfellow went to Heidelberg and settled down for study, yielding his bereaved spirit all the more willingly to the influence of German sentiment and the not yet outworn romanticism of the epoch. Then, after some pleasant travelling in Switzerland, he returned home in October 1836.

Two months later found him at work in Cambridge and soon he was established in the famous Craigie House. He devoted himself to his lecturing and to superintending his assistants—foreigners, who gave him not a little trouble. He was no recluse, and enjoyed especially the society of such men as the historian W. H. Prescott (q.v.), Charles Sumner (q.v.), and that "heartiest of Greek Professors," as he

was called by Dickens, whom Longfellow also knew pleasantly, Cornelius C. Felton (q.v.). Soon he resumed his long abandoned habit of writing verses, and after gaining popularity in the magazines through such pieces as 'The Psalm of Life,' he issued his first volume of poems, 'Voices of the Night,' late in 1839. It made an instant appeal, partly through its sound, moral didacticism, partly through its sentiment and its melody, both of which had been in considerable measure derived from Longfellow's study of German poetry. Earlier in the same year he had published a prose work equally or more indebted to German literature—'Hyperion, a Romance,' which was also very popular. This idealized record of his foreign experiences and the later prose tale of New England village life, 'Kavanagh' (1849), have long since ceased to hold the majority of readers, but 'Hyperion' was very important in his work as a transmitter of old-world culture. Late in 1841 his second volume of verse, 'Ballads and Other Poems,' with such moving pieces as 'The Wreck of the Hesperus' secured him in his position as the most popular of American poets—the singer whose songs have gone straightest to the largest number of hearts. There is evidence that he deliberately sought to move the people's feelings, and never was conscious literary effort more thoroughly successful.

In 1842 he paid a third visit to Europe, forming his memorable friendship with the German poet Freiligrath and getting the inspiration for such poems as 'The Belfry of Bruges.' While sailing back he wrote his 'Poems on Slavery,' published late in the year. His gentle nature did not fit him to be a militant poet like Whittier, but his slave lyrics were effective through their sincerity and their metrical and descriptive power.

In July 1843, he married Miss Frances Elizabeth Appleton, of Boston, a beautiful, cultured, and wealthy young woman whom he had met on his second visit to Europe and had portrayed as Mary Ashburton in 'Hyperion.' She bore him children, made his home a hospitable centre, and ministered to him in an ideal way until her tragic death. The next seventeen years formed a period of quiet work and maturing fame. His drama 'The Spanish Student' (1843) was a failure, but 'The Poets and Poetry of Europe' (1845) and 'The Belfry of Bruges and Other Poems' (1846) did him credit, and the beautiful idyll 'Evangeline' (1847) not only won all hearts, but enabled his admirers to proclaim him as an American poet who had succeeded in a fairly elaborate work of art. The not yet naturalized hexameters and the bookish origin of the descriptions have not effectively counteracted the narrative power and the pathos of the story, and 'Evangeline' seems destined to hold its own with readers yet unborn.

Longfellow had already planned a still more elaborate work on which he labored for many years, but which he was never able to make a success. This was 'Christus, a Mystery,' finally completed in 1872, a poem designed to picture Christendom in the apostolic, the mediæval, and the modern periods. The second portion, 'The Golden Legend' (1851) was the part first published and was by far the best. Its pictures of mediæval life have deservedly won high

praise, but the general public has remained singularly cold to the merits of the work.

Meanwhile, the duties of his professorship, little onerous though they seem to have been, weighed more and more heavily on Longfellow, who was also troubled with weak eyes, frequent attacks of neuralgia, and the importunities of autograph hunters and other bores. In 1854 he resigned his chair and thenceforth devoted himself entirely to literary work and pleasant social life. His Indian epic 'Hiawatha' (1855), written in the trochaic measure of the Finnish 'Kalevala,' was immediately popular, and three years later in 'The Courtship of Miles Standish,' he reached his highest point as a narrative poet. Excellent though 'Evangeline,' 'The Golden Legend,' and 'Hiawatha' had been, they had, nevertheless, been too plainly the work of a sophisticated poet writing in his library; 'Miles Standish,' dealing as it did with the past of Longfellow's native New England, drew part of its inspiration from the poet's own life and character, moulded as they were by tradition and environment.

During the agitated period which immediately preceded the Civil War Longfellow sympathized with the cause represented by his friend Sumner, but took no active part in the strife. In July 1861 the tragedy of his life came to him late—his wife was burned to death, her light dress having caught fire from a match on the floor. He was practically heart-broken, but bore his bereavement manfully. Taking up a task that had long before interested him, he sought solace in translating the great poem of Dante. With the aid of Lowell and Professor Charles Eliot Norton (q.v.) he completed the work in about five years (published 1867-1870). It ranks with the best of such renderings of great poems into English, though some have questioned whether Longfellow was not more successful in his earlier attempts to translate a poet always dear to him.

Meanwhile, in 1863, he had published his 'Tales of a Wayside Inn,' some portions of which, such as 'The Saga of King Olaf,' were excellent. In 1868 'The New England Tragedies,' the final section of 'Christus,' failed to attract readers, as did also the first section, 'The Divine Tragedy,' which appeared in 1871. In the spring of 1868 he sailed for the last time to Europe and remained over a year, receiving degrees from Oxford and Cambridge and other evidences of the affection and admiration his works had gained for him abroad. The rest of his life was marked only by the appearance of an occasional volume, and by a growing veneration among his countrymen for his character and his genius. Probably the most significant productions of his old age were some of his sonnets and his dignified 'Mortuaria Salutamus,' delivered at Bowdoin (in 1875) at the semi-centennial of his class. He lived on, declining in health but still preserving the serenity of his disposition, until 24 March 1882, when he died after a short illness. Two years later his bust was placed in the Poets' Corner of Westminster Abbey—for his fame was almost as truly a British as an American possession.

Longfellow is generally admitted to be the most popular of American poets, and the recent celebration of his centenary shows that there has been no real abatement of his countrymen's

regard for his character and his works. Naturally, however, he has not escaped censure on the score of the comparatively derivative and facile quality of his genius. Authors of greater individuality, of finer artistic powers and training, of more pronounced national and democratic qualities—Emerson, Poe, Hawthorne, Whitman, for example,—have received higher praise from critics and have aroused in their devotees a more fervid admiration than has fallen to Longfellow's lot, at least of late years. Waiving comparisons, we may frankly admit that Longfellow did follow, in the main, well-beaten paths, that he was much indebted to the culture of other nations, that he fell short of the higher reaches of the art of poetry, that a considerable proportion of his work is of but slight value. On the other hand, we should insist that nearly all his work, whether in prose or verse, was important in the development of American literature and the American character, that within his limits he was a true and very accomplished artist, that he succeeded in both elaborate and unelaborate forms, that his fame transcended the bounds of his own language, and that, as a narrative poet and a writer of appealing lyrics of sentiment and reflection, he has left a body of work of permanent and individual value. It seems to be hypercritical not to allow the author of 'Flowers,' 'The Building of the Ship,' 'The Bridge,' 'The Day is Done,' and scores of similar lyrics, of such sonnets as the beautiful 'Cross of Snow' (in memory of his second wife), and of such sustained poems as 'Evangeline,' 'The Golden Legend,' 'Hiawatha,' and 'The Courtship of Miles Standish,' the ungrudging praise due to the poet who is both great and essentially good and wholesome.

Longfellow's more important publications have already been named, but to them may be added 'The Seaside and the Fireside' (1850), which contained 'The Building of the Ship'; 'Flower-de-Luce' (1867); 'Aftermath' (1874); 'The Masque of Pandora and Other Poems' (1875), which included 'Morituri Salutamus'; 'Keramos and Other Poems' (1878); 'Ultima Thule' (1880); 'In the Harbor' (1882); and 'Michael Angelo' (1883). For bibliography see Foley's 'American Authors' and the appendix to E. S. Robertson's memoir in the 'Great Writers' series. A very useful list of authorities is given in C. H. Page's 'Chief American Poets,' pp. 641-642.

Bibliography.—There are good editions of the complete works (e.g., the Riverside in 11 vols.) and of the poems (e.g., Cambridge, 1 vol.). The standard biography is that by Samuel Longfellow (3 vols., 1891—superseding the 'Life,' 2 vols., and 'Final Memorials'). An excellent brief sketch is that by G. R. Carpenter in the 'Beacon Biographies.' The volume in the 'American Men of Letters' is by Col. T. W. Higginson. Consult also W. D. Howells, 'My Literary Friends,' (1900), and Charles Eliot Norton's 'Longfellow' (1907—with poems of an autobiographical character). For criticism consult Stedman's 'Poets of America' and the histories of American literature.

WILLIAM P. TRENT,
Professor of English Literature, Columbia University.

Longfellow, Samuel, American Unitarian clergyman and poet: b. Portland, Maine, 18

June 1819; d. Cape Elizabeth, Maine, 3 Oct. 1892. He was a younger brother of H. W. Longfellow, and was graduated from Harvard in 1839 and from Harvard Divinity School in 1846. After his ordination to the ministry he was pastor of the Unitarian Church at Fall River, Mass., 1848-51; of the 2d Unitarian Church in Brooklyn, L. I., 1853-60; and of the Unitarian Church at Germantown, Philadelphia, 1877-82. His remaining years were spent in Cambridge. His fame as a poet has been overshadowed by that of his brother, but he had a very distinct poetic gift, and his hymns, of which he wrote many, are among the best of modern religious lyrics.

His published works include: 'A Book of Hymns,' with S. Johnson (1846), a compilation revised in 1864 as 'Hymns of the Spirit'; 'Thalatta: a Book for the Seaside,' with T. W. Higginson (1853), a verse compilation partly original; 'Life of Henry Wadsworth Longfellow' (1886); 'Final Memorials of Henry Wadsworth Longfellow' (1887); 'Essays and Sermons' (1894); 'Hymns and Verses' (1894). Consult: May, 'Memoir and Letters of Samuel Longfellow' (1894).

Longfellow, William Pitt Preble, American architect: b. Portland, Maine, 25 Oct. 1836. He is a nephew of Henry W. Longfellow (q.v.), and was graduated from Harvard in 1855. He was assistant architect of the Treasury Department 1860-72; is a fellow of the American Society of Architects, and was the original editor of 'The American Architect.' He was chairman of the architectural section of the Board of Judges of the World's Columbian Exposition, 1893. He has published: 'Abstract of Letters on Perspective' (1889); 'Cyclopaedia of Architecture in Italy, Greece and the Levant' (1895), a work of great value; 'The Column and the Arch' (1899); 'Architectural Essays'; 'Applied Perspective' (1901).

Longicornes, lön-jī-kôr-nēz, or **Long-horned Beetles.** See CERAMBYCIDÆ.

Longino, Andrew Houston, American lawyer: b. Lawrence County, Miss., 16 May 1855. He was graduated from Mississippi College, Clinton, Miss., in 1876 and until 1880 was clerk of the circuit and chancery courts for Lawrence County. He was elected to the State senate in 1880 and in the following year was admitted to the bar. He served until 1884 in the State senate and was appointed district attorney for southern Mississippi and in 1894 became chancellor. He was elected governor of Mississippi for a term of four years in 1900.

Longinus, Cassius, Athenian Neoplatonic philosopher and rhetorician: b. about 213 A.D.; d. Palmyra, Syria, 273 A.D. Greek literature was the principal subject of his studies. He studied the philosophy of the day under Ammonius Sacas at Alexandria, but subsequently became an ardent adherent of the Platonic philosophy and annually celebrated the birthday of its founder by a banquet. He afterward visited the East, and on the invitation of Queen Zenobia went to Palmyra to instruct her in Greek learning and to educate her children. On the death of her husband he was employed by her in the administration of the state, and advised her to throw off the Roman yoke, by which means he was involved in the fate of this queen. For

when Zenobia was taken prisoner by the Emperor Aurelian, and could save her life only by betraying her counsellors, Longinus, as the chief of them, was seized and beheaded 273 A.D. He suffered death with all the firmness of a philosopher. He was distinguished by his oratory as well as his statesmanship and love of liberty. He appears to have known Latin and Syriac as well as Greek. The work known as 'Longinus on the Sublime,' the best piece of literary criticism in the Greek language, was written either by him or by a certain Dionysius Longinus, whose date is the 1st century after Christ.

Longitude, lǒn'jī-tūd, of a heavenly body, is the angle between two planes, both of which are at right angles to the ecliptic, and pass through the sun (heliocentric longitude), or through the earth (geocentric longitude). The longitude of a place on the earth is the angle between the meridian through the place and some fixed meridian. At the Geodetic Congress held in 1884 at Washington, and composed of scientific representatives from the principal countries of the world, it was resolved to adopt the meridian of Greenwich as the universal prime or first meridian, the representatives of France being the only important objectors. Longitude, or the angle between two meridians, may be measured by the arc of the equator, or of any parallel intercepted between them. As the parallels get smaller toward the poles, it is evident that degrees of longitude which are $69\frac{1}{2}$ statute miles long at the equator get shorter toward the poles. At all places of the same latitude the length of a longitude degree (measured due east and west) is the same. All methods of determining longitude are based on this fact. (1) A method formerly employed to determine the difference in longitude between two land stations was to carry chronometers backward and forward a number of times from one place to the other until the effects of variation of rate had been eliminated; comparison of their indications with the sidereal times at the places gave the longitude. (2) A ship carries a chronometer indicating Greenwich time; the local time at any place is known from observation of the sun, hence the longitude of the place may be calculated. (3) The Nautical Almanac gives the Greenwich time at which the moon is at certain distances from certain stars; mariners note the local time at which the moon is at the same distances from these stars (they are aware of the local time from observation of the sun in the daytime), and so the longitude is known. (4) The eclipses of Jupiter's satellites are seen by all observers on the earth at the same instant; their Greenwich times being noted in the Nautical Almanac, and their local times being observed as in method (3), the difference in time from Greenwich is known. The tables of these eclipses are not yet complete enough for this method to be in great use. Observations of lunar transits and the occultation of fixed stars afford other means of determining longitude. See also LATITUDE.

Longley, James Wilberforce, Canadian politician: b. Paradise, Nova Scotia, 4 Jan. 1849. He was educated at Acadia College, N. S., studied law in Halifax and was called to the bar in 1875, becoming Queen's Counsel in 1890. He was chief editorial writer for the 'Acadian Re-

corder' 1873-87, and was managing editor of the Halifax *Morning Chronicle* (1887-91). Since 1882 he has been a member of Nova Scotia Assembly and in 1886 was made attorney-general. He materially assisted the passage of the bill for the abolition of imprisonment for debt.

Longmans, London publishers for many years identified with high-class literature. Thomas Longman (1699-1755) was apprenticed to John Osborne, bookseller, Lombard Street. Longman bought the business of William Taylor, publisher of 'Robinson Crusoe,' conducted in Paternoster Row, whence he moved in 1726 to the present site. Longman was a shareholder in many important publications, such as Boyle's 'Works,' Ainsworth's 'Latin Dictionary,' Chambers' 'Cyclopaedia,' and Johnson's 'Dictionary.' His nephew and successor, Thomas Longman (1731-97), published a new edition of Chambers'. With Thomas Norton Longman (1771-1842) the firm reached a high degree of literary and commercial prosperity. Lindley Murray's 'Grammar' was published and proved valuable, while the firm had literary connection with Wordsworth, Southey, Coleridge, Scott, Moore (to whom it paid £3,000 for 'Lalla Rookh'), Sidney Smith, and other leading authors. In 1826 the 'Edinburgh Review' became the property of Longmans. The next important members of the firm were Thomas Longman (1804-79), the eldest son of T. N. Longman who issued a beautifully illustrated New Testament, and William Longman (1813-77), the third son, who wrote 'Lectures on the History of England' (1859); 'History of the Life and Times of Edward III.' (1869); and 'History of the Three Cathedrals of St. Paul' (1873). The events of this generation were the publication in succession of Macaulay's 'Lays of Ancient Rome' (1842); 'Essays' (1843); and 'History.' The famous check for £20,000 paid to Macaulay as his share of the profits of the 3d and 4th volumes for the first few months (1855) is still preserved. The partners of the fifth generation were Thomas Norton Longman and George Henry Longman, sons of Thomas Longman, and Charles James Longman and H. H. Longman, sons of William Longman. One of the earliest ventures of this time was Disraeli's 'Endymion,' for which the author received £10,000. Lord Beaconsfield's other works had come into possession of the firm in 1870, when they published his 'Lothair.' A magazine—'Longman's'—was also established by the house.

Longobardi, lǒn-gō-bār'di. See LOMBARDS.

Long's Peak, one of the highest elevations of the Rocky Mountains, in Colorado, about 48 miles northwest of Denver. Its height is 14,271 feet. It was named in honor of Col. Stephen Harriman Long (q.v.).

Longspurs, a group of large finches, typically of the genus *Calcarius*, distinguished by the great size of the claw of the hind toe. All are northern birds, frequenting open lands and inclined to form into flocks. The Lapland longspur (*C. lapponicus*) is known throughout the northern parts of Europe and Asia as well as America, and breeds only in the extreme north, coming south of the area of deep snow in winter, but always rare and irregular in the United States. Three other species are restricted to

LONGSTREET—LONGUEVILLE

North America, one of which, the chestnut-colored (*L. ornatus*) is well-known in the West, as it breeds abundantly on the plains of Dakota and Montana, making its nest on the ground. All are handsome birds, with a mixture of colors, in which black, chestnut, red and buff are conspicuous. Detailed descriptions of all may be found in Dr. Coues' 'Birds of the Northwest' (1874).

Longstreet, Augustus Baldwin, son of William Longstreet (q.v.), American jurist and author: b. Augusta, Ga., 22 Sept. 1790; d. Oxford, Miss., 9 Sept. 1870. He was graduated at Yale College in 1813, began the study of law at Litchfield, Conn., and was admitted to practice in Georgia in 1815. In 1821 he represented the county of Greene in the legislature, and in 1822 was made judge of the superior court of Ocmulgee circuit. Declining re-election to the bench, he returned to the bar, and was especially distinguished for his efforts and successes in criminal cases. In 1822 he removed to Augusta, Ga., and founded the 'Sentinel.' In 1838 he entered the ministry of the Methodist church, and was president of Emory College 1839-48 and subsequently of the University of Mississippi. His works include: 'Georgia Scenes,' a series of broadly humorous sketches, long popular (1840); 'Letters From Georgia to Massachusetts.'

Longstreet, James, American soldier: b. in Edgefield district, S. C., 8 Jan. 1821; d. Gainesville, Ga., 2 Jan. 1904. He was graduated at the United States Military Academy in 1842; entered the army as lieutenant of infantry and, after performing duty at various Western posts, served in the Mexican War, in which (at Chapultepec) he was badly wounded and for gallantry in which he received the brevets of captain and major. From 1847 to 1852 he was stationed on the Texas frontier and in 1858 became paymaster with the rank of major. In June 1861, the Civil War having broken out, he resigned from the United States army and entered that of the Confederacy as a brigadier-general. At the first battle of Bull Run (q.v.) he commanded a brigade, and in 1862 was made a major-general. In the retreat before McClellan, during the Peninsular campaign (q.v.) he was in command of Gen. J. E. Johnston's rear guard, and contributed greatly to the safe withdrawal of the main army to Richmond. In the Seven Days' Battles (q.v.) he fought with credit to himself and his division, whose losses were very heavy; and at the second battle of Bull Run (q.v.) he displayed promptness, energy, and generalship to which the Confederate victory was largely attributed. He commanded the right wing at Antietam, and at the battle of Fredericksburg (q.v.) had command of the left, repulsing the desperate assault of Burnside's army. After Fredericksburg he was made lieutenant-general, and with that rank commanded one of the three corps of the Confederate army of invasion, known as the Army of Northern Virginia. At the battle of Gettysburg (q.v.) during the second and third days, he commanded the right wing, which sustained the chief burden of the conflict, furnishing the columns that made Pickett's charge. Transferred to the Army of Tennessee, Longstreet arrived on the field in time to save the day at the battle of Chickamauga (q.v.). He next

moved unsuccessfully against Burnside at Knoxville (q.v.) and early in 1864 rejoined General Lee in Virginia. Again distinguishing himself in the battles of the Wilderness, he was severely wounded and for some months disabled, but was in command of the First corps of the Army of Northern Virginia during the later months of 1864 and took some further part in active field-service, retaining to the last his distinction as a general and a fighter, and coming out of the war at its close with the respect of the whole country, which has never diminished. After the war he engaged in business in New Orleans and, having become a Republican in politics, was surveyor of customs at that port, 1869-73. In the same city he was afterward postmaster. He removed to Georgia in 1875; was United States minister to Turkey, 1880-1; in 1881-4 served as United States marshal of Georgia, and was appointed United States railway commissioner in 1898. He has written for periodicals, and has published 'From Manassas to Appomattox' (1896).

Longstreet, William, American inventor: b. New Jersey 1760; d. Georgia 1814. He settled in Augusta, Ga., in early life and on 26 Sept. 1790 wrote a letter to Thomas Telfair of Savannah asking his assistance in raising the means to construct a boat to be propelled by steam. This letter was published in the Savannah and Augusta newspapers, but funds were not immediately obtained, though he stated his entire confidence in the success of the scheme. He was subsequently furnished with the necessary means for experiment, and constructed a small model boat, upon a plan very different from Fulton's, which went on the Savannah River against the stream at the rate of five miles an hour. Cotton had previously been ginned by two rollers, not quite one inch in diameter, which caught the fibres, pressed out the seed, and delivered the clean cotton on the other side, where it was taken by the ginner's hand, and deposited in a bag attached to his person. Longstreet invented and patented the "breast roller," moved by horse power, which entirely superseded the old method. The inventor set up two of his gins in Augusta, which were propelled by steam, worked admirably, and promised him a fortune. They were, however, destroyed by fire within a week. He next erected a set of steam mills near St. Mary's, Ga., which were destroyed by the British in an invasion in the War of 1812. These disasters exhausted his resources and discouraged his enterprise, though he was confident that steam would soon supersede all other motive powers.

Longueuil, lön-gél, Canada, town, in Chamby County, in the province of Quebec; on the Saint Lawrence River, and on the Canadian Pacific railroad. It is situated opposite Hochelaga, the northeastern part of Montreal. Longueuil is a residential suburb of Montreal, the country around contains many summer homes of city residents. It has Saint Anthony's orphanage and an academy for girls and one for boys. Pop. (1901) 2,835.

Longueville, Anne Geneviève de Bourbon Condé, an zhên-vê-êv dè boor-bôn kôn-dê lôn-gvê, DUCHESS of French beauty and politician: b. Vincennes 29 Aug. 1619; d. Paris 15 April 1679. Her father, Henry II., prince of Condé, was prisoner in the chateau of Vincennes

at the time of her birth. Her brothers were the great Condé and the Prince of Conti. The Prince de Joinville, to whom she had been betrothed, having died, she married in 1642 the Duke de Longueville, a widower double her age. Imbibing a fondness for politics, she displayed it most actively in the part which she took in the Fronde. In order to punish the duchess, her brothers and husband were arrested by order of Anne of Austria, the regent, in 1650; but she persisted in her resistance to the court, and repaired to the citadel of Stenay in Flanders, of which she took the command, and was able to induce Turenne to join the Fronde. After the peace of 1659 she devoted herself to a religious life and her influence in Rome was said to have secured for the Janesists the so-called peace of Clement IX. (1668). The later part of her life was spent in the Carmelite convent of Paris in most stringent observance of religious duties. Cousin, in his 'Madame de Longueville' (6th ed., 1859), calls her "the soul of the Fronde."

Longus, löng'güs, Greek writer, supposed to have lived about the close of the 4th or the beginning of the 5th century A.D. Concerning his history nothing is known. He was the author of a pastoral romance entitled 'The Pastoral of Daphnis and Chloe,' of which the best editions are those of Viljoison (1778), Courier (1810), Passow (1811). Longus is the latest of the bucolic poets and in the Renaissance period was widely read, his pastoral descriptions, as given in Amyot's French translation, having not a little to do with the revival of the pastoral form.

Longview, Texas, town, county-seat of Gregg County; on the Texas & P., the Texas, S. V. & N., and the Great N. R.R.'s; about 240 miles northeast of Austin and 120 miles east of Dallas. It is situated in an agricultural section, in which are raised large crops of grain and cotton. The chief manufacturing establishments are foundry, lumber-mills, railroad-shops, cottonseed-oil mills, and plow-works. The principal offices of the Texas, Sabine Valley & Northwestern railroad are in Longview. The trade is principally in agricultural products, live stock, hides, cottonseed-oil, and lumber. Pop. (1890) 2,034; (1900) 3,591.

Longworth, Nicholas, American wine manufacturer and horticulturist; b. Newark, N. J., 16 Jan. 1782; d. 1863. At 21 he went to the then unimportant settlement of Cincinnati, where he studied law. After 25 years' experience at the bar he retired from professional life in order to devote himself to the cultivation of the grape, with a view of manufacturing wine. At first his efforts were unsuccessful from his having adopted the erroneous notion of the early American vine growers, that foreign plants were alone to be relied upon. He had imported many different species from every vine-growing country in Europe before trying those indigenous to the United States. About 1828 he commenced the experiment, and became a high authority in vine culture, being not infrequently called the "Father of American Grape Culture."

Lönnrot, lén'röt, Elias, Finnish philologist; b. Sammatti, in Nyland, 9 April 1802; d. there 19 March 1884. Recognizing the value of the people's songs and ballads for Finnish language

study, he spent years in collecting such material in Finland, Lapland, and adjoining provinces, and published the fruits of his researches in a series of volumes. Among his 'finds' is to be numbered the great popular epic 'Kalevala,' of which only a few cantos were previously known to the learned world. He wrote a 'Finnish-Swedish Dictionary' (1866-80). See KALEVALA.

Loo (short for lanterloo, from the Dutch name), a game of cards played with five (sometimes three) cards, dealt from a whole pack, either by threes and twos, or one at a time. After dealing, a card is turned up for trumps. The jack of clubs, or the jack of the trump suit, as agreed on, is the highest card, styled "pam"; the ace of trumps is next, and then the other cards as in whist. Five cards of a suit, or four with "pam," compose a "flush," which sweeps the board, and yields only to a superior flush, or the elder hand. When the ace of trumps is led, it is usual to say, "Pam be civil"; the holder of the jack (of trumps or clubs; see above) is then expected to let the ace pass. Each player has the liberty of changing his cards for others from the pack, or of throwing up the hand, in order to escape being looted, that is, failure to gain a trick. All those that win tricks divide the pool or "loo," to which on entering the game each player contributes chips (usually three) in proportion to the tricks taken. Every player who is looted must again contribute a stake, which, with the dealer's stake, forms a new pool.

Loo-choo Islands. See LIU-KIU ISLANDS.

Loo'fah, Egyptian, the fibrous portion of the fruit of one or two species of the genus *Luffa* of the gourd family, sold for use as a bath-sponge or flesh-rubber. There are about 10 species of the genus known, but the "towel gourd," as this bath-sponge is sometimes called, appears to be obtained chiefly from *L. ægyptiaca*. In the West Indies the fruit of *L. acutangula* yields a similar network of fibres, and is there used as a sponge or dishcloth, and worked up into baskets and small ornamental articles.

Looking Backward, 2000-1887, a romance by Edward Bellamy, published in 1888. It had a sale of nearly 400,000 copies in the next ten years, and is still in demand. It recounts the strange experiences of Julian West, born in 1857, who in 1887 is put into a hypnotic sleep. In the year 2000, Dr. Leete, a retired physician, is conducting excavations in his garden, when West's subterranean chamber is disclosed. The doctor discovers and resuscitates the young man, who finds himself in a regenerated world.

Lookout Mountain. See CHATTANOOGA, BATTLE OF.

Loom, a term originally meaning simply "tool," but now particularized so as to apply to a machine for weaving. The simplest form of

FIG. 1.

the loom, still in use among semi-primitive tribes and up to the middle of the 18th century practically the only form, was the hand loom, a rectangular frame, from one side of which yarn is stretched to the opposite side, where it is so secured that the transverse threads may be passed by hand "over and under" the threads already stretched. Fig. 1

shows the simplest form of this loom. The form in commoner use in civilization up to Cartwright's invention of the power loom in 1785 is merely this same actual frame set in a skeleton box (AAAA) in a horizontal position (Fig. 2). The end pieces of the actual frame are now rollers, so that the length of the piece of cloth is no longer necessarily less than the length of the frame. These rollers are the beam or yarn-roll (B), which is at the back of the loom, and upon which the warp threads are wound, and the cloth beam (C) to which the threads are fastened and which winds up the cloth as it is made. The threads of the warp, held tight by weights (b, b), pass through the eyes of the heddles (or healds), thus being separated to permit of the passage of the shuttle, and also through the reed. The shuttle in the hand-loom is thrown by the operator, and in the power loom by the picker-staff machinery; in either case it is made of hard wood, is pointed at either end and carries in a recess the quill or bobbin.

Fig. 2.

This hand-loom was first successfully improved, after the unfortunate attempts of De Gennes in 1678, by Edmund Cartwright, who undertook in 1785 to counterfeit by mechanical means the three simple motions of weaving. He had neither mechanical nor textile training, but his loom though cumbersome and awkward is essentially that now in use. The simplest modern loom differs essentially from the hand loom in that the warp yarn is no longer stretched direct from the yarn roll to the cloth beam, and these two parts are no longer placed at the same height from the base of the frame nor at so great a distance as before. The yarn runs upward from the warp-beam over the whip-roll, thence is carried through heald, heddle, or (the American term) harness, and through the reed, and down from the latter to the cloth roll. The advantage of this arrangement is greater stability and a distinct saving in space, the depth of the loom being materially decreased. With the old fashioned heddle only the simplest and most regular webs could be woven; for figured patterns the most effective mechanism is the Jacquard attachment, patented by a weaver of Lyons, Joseph Marie Jacquard, in 1801. This machine lends itself readily to use with any loom. It may be described as a means of forming the

shed and governing the heddle,—in fine, it takes the place of the weaver's fingers. A revolving drum or cylinder is so perforated as to catch some or all needles, which in turn govern a set of perpendicular hooks. These hooks guide the threads of the warp, so that the weaving is no longer of necessity simply "under or over." How many threads are to be skipped is determined by a perforated card-board, the perforations occurring where the thread of the warp is to lie above the filling; but if the warp-threads are not to be raised no holes are cut in the cards, the needles do not enter the cylinder, and the hook attached to the needle does not lift, by means of its neck-cord or loop of twine, the thread of the warp. A series of these cards, each with different perforations, makes an almost infinite combination of patterns possible, as each card makes a different shed.

The hand loom is still used for the manufacture of rugs and fine carpets, but the power loom, driven by various powers, electricity being the latest and in some ways the most economical, is used for almost any purpose. The ribbon-loom, for instance, weaves simultaneously a number of narrow pieces. Many attachments, invented in a long series, have continuously and wonderfully decreased the need of any supervision of the loom, making it more and more automatic: thus a shuttle protector automatically stops the machinery if the shuttle fails to fly all the way across the warp; the filling stop motion protects the machinery from running on uselessly when the filling breaks or runs out; and take-up, let-off, and warp-stop motions are further automatic devices. The highest pitch of automatic attachment is the Northrop patent, which is a hopper full of loaded bobbins; these are fed into the place of the empty bobbins as soon as the yarn is exhausted.

See Posselt, 'Textile Machinery' (1901) and 'Jacquard Machine Analyzed and Explained' (1893); and Barlow, 'History and Principles of Weaving by Hand and by Power' (1879).

Loomis, Alfred Lebbeus, American physician: b. Bennington, Vt., in 1833; d. 23 Jan. 1895. He was graduated at Union College in 1851, and studied medicine in New York city at the College of Physicians and Surgeons, where he was graduated in 1852. He gave his attention to diseases of the lungs at a time when auscultation and percussion were acquiring great scientific importance in medical practice, and in the treatment of such diseases became an efficient specialist. In 1859 he was appointed visiting physician to Bellevue Hospital, New York, and was made lecturer on physical diagnosis at the College of Physicians and Surgeons in 1862. Having spent some months in the Adirondack Mountains for the improvement of his health, in later years he established the Sanitarium at Saranac and the Hospital for Consumptives at Liberty, N. Y. In 1866 he accepted the professorship of theory and practice of medicine at the University of the City of New York, remaining in connection with that institution until his death. The work done by him for its medical department was of great and lasting importance, as were also the services he rendered to the New York Academy of Medicine. In 1874 he was appointed visiting physician to Mount Sinai Hospital; was president of the New York Academy of Medicine, 1890-90 and 1891-2. His publications include 'Lessons in Physical Diag-

nosis' (1870); 'Lectures on Fevers' (1877); and 'A Text-book of Practical Medicine' (1884). He also edited 'An American System of Medicine' (1894).

Loomis, Charles Battell, American humorist: b. Brooklyn, N. Y., 16 Sept. 1861. He was educated at the Brooklyn Polytechnic Institute and held a business clerkship 1879-91. He is a frequent contributor to periodicals and has published 'Just Rhymes' (1899); 'The Four-Masted Cat-boat' (1899); 'Yankee Enchantments' (1900); 'A Partnership in 'Magic' (1903).

Loomis, Chester, American painter: b. near Syracuse, N. Y., 18 Oct. 1852. He was educated at Cornell University (1868-71); studied painting at Paris under Léon Bonnat, and after a residence of 11 years in France opened a studio at Englewood, N. J. He is favorably known as a figure and landscape painter and his pictures are found in many private collections. His 'Christopher Sly' was awarded a gold medal at the Massachusetts Charitable and Mechanics' Institution Exhibition and was subsequently purchased by the Indianapolis Art Association.

Loomis, Elias, American physicist: b. Willington, Conn., 7 Aug. 1811; d. New Haven, Conn., 15 Aug. 1899. He was graduated at Yale College in 1830, and was tutor there in 1833-6. He was the first person in America to obtain a view of Halley's comet, at its return in August 1835, and his observations on that body, with a computation of its orbit, were published in the 'American Journal of Science.' After a year's study in Paris he was professor (1837-44) of mathematics in Western Reserve College, Ohio, of natural philosophy (1844-60) in the University of New York, and of natural philosophy and astronomy (from 1860) at Yale. He devoted much of his time to original research, wrote more than 100 scientific treatises, and published a series of text-books on mathematics, natural philosophy, astronomy, and meteorology, of which more than 500,000 copies were sold. Among his publications were: 'Elements of Algebra'; 'Elements of Geometry and Conic Sections'; 'Recent Progress in Astronomy.'

Loomis, Francis B., American journalist and diplomatist: b. Marietta, Ohio, 27 July 1861. He was a graduate from Marietta College, and in 1883 joined the staff of the New York *Tribune*. He was state librarian of Ohio 1885-7; consul at St. Etienne, France, 1890-3, and editor-in-chief of the Cincinnati *Daily Tribune* 1893-6. He was United States envoy-extraordinary and minister plenipotentiary to Venezuela, 1897-1901, and while there was active in promoting the interests of American commerce in South America. He filled the same diplomatic position at the court of Portugal 1901-03, and became assistant secretary of state in January 1903, but resigned in 1905.

Loomis, Gustavus, American soldier: b. Thetford, Vt., 1780; d. 1872. He was graduated at West Point and received his commission as sub-lieutenant of artillery in 1811. He saw service on the Niagara frontier from 1812 to 1813, in which latter year he took part in the capture of Fort George (May 27) and was made prisoner the following December at Fort Niagara. During the war with Great Britain, the Black Hawk war, and the campaign against

the Seminole Indians, he held important commands, and after the Civil War, in which he served as superintendent of the general recruiting service, was retired with rank as colonel of infantry. In 1865 he received the brevet of brigadier-general of the United States army.

Loomis, Lafayette Charles, American author and educator: b. North Coventry, Conn., 7 July 1824. He was graduated from Wesleyan University, Conn., in 1844, and was successively president of colleges at Wilmington, Del., and Wheeling, W. Va., and later medical professor at Howard University, Washington, D. C. He has published 'Mizpah' (1859); 'Mental and Social Culture' (1868); 'Index Guide to Travel and Art Culture in Europe' (1880); 'Myself' (1894).

Loomis, Silas Lawrence, American scientist and inventor: b. Coventry, Conn., 1822. He was graduated from Wesleyan University in 1844, from the medical school of Georgetown University in 1856, and was professor of physiology at Georgetown in 1859-60. In 1857 he was appointed astronomer to the United States coast survey, in 1860 instructor in mathematics to naval cadets, in 1861-7 was professor of chemistry and toxicology at Georgetown, and subsequently occupied a chair at Harvard. Among his inventions are a process for manufacturing a textile fabric from the palmetto, and another for making profitable use of chromium ores. He wrote text-books of arithmetic, a 'Key to the Normal Course' (1867), and other works.

Loon, lō-on', Philippines, a pueblo of the province of Bohol, situated on the west coast, 13 miles north of Tagbilaran, and opposite Dalaguete, Cebu. A mole 328 yards long, protecting the harbor, extends to the town, which is reached by steps cut in the rock. It is picturesquely situated on the slope of the Cammanoc hills, and has on old Spanish fort with bastions. It is centrally located for trade, and is the largest town in the province. Pop. 15,400.

Loon. See DIVER.

Loos, lōs, **Charles Louis**, American educator: b. Woerth-sur-Sauer, Basse-Alsace, France, 23 Dec. 1823. He came to the United States in 1832, and settled at New Franklin, Ohio, where he studied English, became connected with the Disciples of Christ in 1858 and preached at 17. He was graduated from Bethany College in 1846, where he was professor of ancient languages 1858-80. He was president of Kentucky University 1880-97. In 1849 he was ordained to the ministry of the Disciples and has been of great prominence in his denomination.

Loosestrife, a plant of the genus *Lysimachia*, of the primrose family, about 40 species of which grow in the temperate zone. Several yellow-flowered species belong to the United States, but those best known are the whorled or four-leaved (*L. quadrifolia*), and the bulb-bearing, *L. terrestris*. Two or three species, especially *L. nummularia*, popularly known as moneywort, creeping Charley and creeping Jenny, have been introduced from Europe. One kind is eaten in India as a pot-herb with fish. "Again and again," says Miss Lounsbury, in her 'Southern Wild Flowers and Trees,' "we come across the loosestrifes during our summer and early autumn rambles. And soon we learn to associate with them their opposite, or

whorled, leaves, always entire, and their upright, rather stiff manner of growth, and very frequently we look for their petals to be darkly spotted near the bases. In personality the genus reminds us somewhat of the *St. John's-wort*, but we think of the latter as being usually freer, more prolific bloomers. The old and pretty legend concerning our present plants is that they loose strife; that they act as peace-makers especially among cattle that are quarrelsome. Believing this, people in the old country used to tie such a spray to their yokes before starting out on a long journey."

The name loosestrife is also given to species of the genus *Lythrum*, which some botanists place in the order *Primulaceae*, of which about a dozen species are widely distributed in temperate climates. They are characterized by four-angled stems, usually opposite leaves which are sometimes whorled, and reddish-purple or white flowers, solitary above and whorled lower down the stems. Some are cultivated for ornament in borders and among shrubbery, where they succeed well. The best-known species is the purple loosestrife (*L. silicaria*), which is frequently planted.

Lope de Vega, lô pã dã vã'gã. See VEGA, CARPIO.

Lopes, lô'pãsh, Caetano, Brazilian historian: b. Bahia October 1780; d. Paris 22 Dec. 1860. He was a mulatto and after obtaining an education in Bahia and Paris, France, settled in the latter place in 1822 and became corresponding member of the Academy of Inscriptions and Belles-lettres. The Emperor Pedro held him in high esteem and the Historical Institute of Rio Janeiro bestowed him its gold medal. He was conspicuous for brightness of style and purity of language. His works, which are numerous, treat of history, biography, and surgery.

Lopes, or Lopez, Fernao, Portuguese chronicler: b. about 1380; d. after 1459. He was appointed chief archivist of the kingdom by Dom Joao I. in 1434, and spent his life in historical research and the composition of chronicles, which for literary and critical value were unsurpassed in his century. His 'Chronicle of Señor Don John I.,' describing the great struggle between Portugal and Castile, invites comparison with Froissart's chronicle on account of its picturesqueness and dramatic reality. Equally vigorous are his chronicles of Dom Pedro I. and Don Fernando.

Lopez, lô'pãz or lô'pãthi, Carlos Antonio, President of Paraguay: b. near Asuncion about 1795; d. there 19 Sept. 1862. He was educated in Asuncion and became noted for his legal acquirements. After the death of President Francia, in 1840, he was secretary of the junta which controlled Paraguay for a few years. In March 1844 the Paraguayan congress adopted the constitution he had drawn up and elected him president of Paraguay for ten years. He was re-elected for three years in 1851; and again in 1857 for seven. He followed Francia's policy in the main and became involved in quarrels with foreign nations. In 1859 the United States sent a naval force to the Plata to enforce demands against him. He offered to submit the question of damages to arbitration, but afterward evaded the claim.

VOL. 10—6

Lopez, Francisco Solano, Paraguayan president: b. Asuncion 24 July 1827; d. near the Aquidaban 1 March 1870. He was the son of Carlos Antonio Lopez (q.v.), then president. In his 18th year his father made him a brigadier-general in the war against Rosas, the dictator of Buenos Ayres. He afterward filled some of the principal offices of state, and was sent to Europe in 1853, accredited to the chief courts there. In 1855 he returned to Paraguay, became minister of war, and on the death of his father, in 1862, president for ten years. He had aimed at the foundation of a great inland empire, and as his military preparations were now complete, and his army superior to that of any of the South American states, he began hostilities against Brazil in 1864. The Argentine Republic and Uruguay allied themselves with Brazil, and after five years' conflict Lopez was reduced to extremities, and was finally surprised on the banks of the Aquidaban by a troop of Brazilian cavalry and slain. The latter part of his career had been stained by many cruelties and wanton murders. Consult: Thompson, 'The War in Paraguay' (1869); Masterman, 'Seven Eventful Years in Paraguay' (1869); Burton, 'Letters from the Battle Fields of Paraguay' (1871); Washburn, 'History of Paraguay' (1871); Schneider, 'Der Krieg der Triple-Allianz' (1872-5).

Lopez, José Hilario, hō-sã' hē-lã'rē-ō, Colombian politician: b. Popayan 18 Feb. 1798; d. Neiva 27 Nov. 1869. He was president of New Granada (Colombia) from 7 March 1849 to 7 March 1852, and in the last named year slavery was abolished and changes were made looking to the formation of a federal government. In the revolutions of 1854 and 1859-62, he fought with the Federalists and was commander-in-chief for part of this period. He was a member of the provisional government 1862-3, and subsequently President of Tolima. In 1867 he was named commander-in-chief of the army.

Lopez, Narciso, Cuban revolutionist: b. Venezuela 1799; d. Havana, Cuba, 1 Sept. 1851. He served for some time in the Spanish army, from which he retired in 1822 with the rank of colonel. After the evacuation of Venezuela by the Spanish troops, he established himself in Cuba, and afterward during a stay at Madrid joined the party of Isabella against Don Carlos, and became successively adjutant of Valdes, governor of the Spanish capital, and senator for Seville, but threw up his offices after the refusal of the Cortes to admit the representatives of Cuba. Valdes became governor-general of that island, and Lopez on returning thither was employed by him in various capacities. He was soon absorbed by the project of throwing off the yoke of Spain, and he proceeded in 1849 to the United States, where he sunk almost his whole fortune in the organization of three successive expeditions to Cuba: the so-called Round island expedition in 1849; the "invasion of Cardenas" expedition in May 1850, both of which failed, and the Bahia-Honda expedition, of August 1851, which ended fatally. Lopez, with several hundred persons of different nationalities whom he had enlisted in various parts of the United States, landed at Morillo, near Havana, where he left 200 of his men under the command of Colonel Crittenden, who were taken by the

Spaniards and shot. Lopez went to Las Pozas, where he succeeded in repelling an attack of the Spanish soldiers; but, isolated from his friends, sought refuge in the mountains, where he was captured and taken to Havana. He was sentenced to death, which he met with great firmness.

Lopez, Vicente Fidel, Argentine historian: b. Buenos Ayres 1814. He is a son of Vicente Lopez y Planes (q.v.). He became rector of the University of Buenos Ayres and has published 'Razas del Perú anteriores a la Conquista'; 'Historia de la Republica Argentina'; 'Tratado de Derecho Romano'; etc.

Lopez, Cape. See CAPE LOPEZ.

Lopez de Ayala, Pedro, pā'drō, Spanish ardo, Spanish dramatist: b. Seville district i May 1828; d. Madrid 30 Jan. 1879. He was educated at the University of Seville, and at Madrid in 1851 had his first drama, 'El Hombre de Estado,' produced. In 1857 he was elected deputy from Badajoz to the Cortes, and subsequently he was a member of Alfonso XII.'s first cabinet. He was the author of numerous lyrics which take excellent rank in Spanish literature, especially of the 'Epistola.' But he was better known as a dramatist of high literary and popular success. Chief of his plays are 'Tanto por Ciento' (So Much per Cent), which was recognized by the bestowal upon him of a gold crown, and 'Consuelo.' Both are searching arraignments of the principles of modern life.

Lopez de Ayala, Pedro, pā'drō, Spanish poet: b. Murcia 1332; d. Calahorra 1407. He served well Henry II., John I., and Henry III., kings of Castile, attained the highest dignities, including those of lord chancellor and high chamberlain of Castile, and wrote the 'Cronicas de los Reyes de Castilla' ('Chronicles of the Kings of Castile') (1780), which covers the period from King Peter to Henry III. In this work he strove to substitute for the dry record of the historiographers a pragmatic account of historical events. He also wrote lyrics, and the 'Rimado de Palacio' ('Rime of the Palace'), a satiric poem on political and social questions.

Lopez y Planes, lō'pāz or lō'pāth ē plā'nēs, Vicente, Argentine poet: b. Buenos Ayres 1784; d. there 1856. He was prominent as a soldier and politician, was member of Congress, 1819-25, and provisional president of the republic, 5 July to 13 Aug. 1827. He presided over the supreme court of justice, and was governor of the province of Buenos Ayres. He was the author of the 'Argentine National Hymn' and other poems.

Lophi'odon, an extinct tapir-like animal, found in the Eocene fresh-water deposits of central Europe. The genus is typical of a family (*Lophisodontidae*) which includes also the genera *Hyracotherium*, *Hyrachus*, *Systemodon* and *Orohippus*, and is a very generalized group probably ancestral to the rhinoceroses. Consult Woodward, 'Vertebrate Paleontology' (1898).

Lophobranchii, lō-fō-brang'kī-i, a suborder of bony fishes, including the "sea-horses" and "pipe-fishes" (*Syngnathidae*). See ICHTHYOLOGY.

Loquat lō'kwat, or Japan Plum, a shrub or small tree (*Eriobotrya japonica*) of the natural order *Rosaceae*. It attains heights of about 20 feet, bears thick evergreen leaves near the

ends of the branches, and fragrant, woolly, whitish flowers in terminal panicles in late summer and autumn, followed by downy yellow oval or pyriform fruits (pomes) which ripen in very early spring. The fruits, which in favorable climates are borne in profusion, are highly esteemed for their sub-acid flesh and their pleasantly flavored seeds, the former being used as a dessert, the latter for flavoring cookery. The tree is a native of Japan and China, whence it has been taken to subtropical climates throughout the world. In the Gulf States and in California it is widely popular as a home fruit, though it appears in northern markets. In California several highly improved varieties were produced during the closing decade of the last century. In the north it is often grown in conservatories.

Lorain, lō-rān', Ohio, city, in Lorain County; on the south shore of Lake Erie, at the mouth of the Black River, and on the New York C. & St. L. (Nickel Plate), Baltimore & O., and Lake Erie & Pittsburg R.R.'s; about 26 miles west of Cleveland. The first permanent settlement was made in 1822 by Barney Meeker. It was incorporated as a village in 1873 and as a city in 1895. It is an agricultural and natural-gas region, and is a shipping port for farm products, for the output of the Central Ohio coal fields, and for the lumber and iron ore of a large section of the State. The chief industries of the city are ship-building, coal shipping, manufacturing steel, general manufacturing, and fishing. The Lorain Steel Company employ about 4,000 people; the American Shipbuilding Company, 1,300; the Baltimore & Ohio, in shops, at docks, etc., 1,000; small industries, about 2,000. The city has excellent public and parish schools, a public library, 22 churches, and Saint Joseph's Hospital. There are five banks with a combined capital of \$300,000. The annual amount of business is about \$2,500,000. About 75 per cent. of the inhabitants are American born. The government is vested in a mayor, a board of public service (three members), and a council of seven members. Four of the council are elected one from each ward, and the other three, at large. The board of education, waterworks trustees, and marshal are chosen by popular election; the board of health are chosen by the council; the police are appointed by the mayor subject to approval by the council. The waterworks are owned and operated by the city. Pop. (1890) 4,863; (1900) 16,028.

F. A. ROWLEY,

Editor of 'Times Herald.'

Lorca, lōr'kā, Spain, city, in the province of Murcia; on the Sangonera River; about 20 miles north of Aguilas, the Mediterranean port. It is an ancient city, established before the Moors came to Spain, as is evidenced by the older houses; but the main part of the city now existing is of Moorish construction. It has considerable manufacturing interests, and in the vicinity are valuable mines of silver, sulphur, and lead. The farms in the surrounding country have to be irrigated in the dry seasons, and for the storage of water of the Sangonera a dam, 800 feet long and 160 feet high, was built near the city. In 1802 the dam burst, and the valley was flooded. Many lives and much property were lost. Lorca was the scene of many battles between the Christians and the Moors. Pop. 70,127.

LORD — LORD CHAMBERLAIN

Lord (Anglo-Saxon "hláford," for "hláfeard," bread-keeper), English title of honor or dignity, used in different senses. In feudal times the lord was the grantor or proprietor of the land, who retained the ultimate property in it, the use only being granted to the tenant. Between the superior lord, or lord paramount, and the actual tenant, stands the lord of the manor or mesne lord. Lord is also a mere title of dignity, attached to certain official stations, which are sometimes hereditary, but sometimes only official or personal, as lord advocate, or lord mayor, a title applied to the chief magistrates of London, York, and Dublin. See also **LORD CHAMBERLAIN** and **LORD LIEUTENANT**. In its most definite sense in English it is equivalent to peer, but does not express any special rank or degree of nobility. The five orders of nobility constitute the "lords temporal," in contradistinction to the prelates of the church, or "lords spiritual," that is, such archbishops and bishops as are members of the legislature and sit in the House of Lords. The title is also applied, but only by courtesy, to the sons of dukes and marquises, and to the eldest sons of earls.

Lord, Chester Sanders, American journalist: b. Romulus, N. Y., 18 March 1850. He studied at Hamilton College, but was not graduated. He was for a time associate editor of the *Oswego* (N. Y.) *Advertiser*, and in 1872 became one of the staff of the *New York Sun*, of which he is managing editor. He was elected a regent of the University of the State of New York in 1897.

Lord, Edwin Chesley Estes, American geologist and chemist: b. Brooklyn, N. Y., 7 May 1868. He was educated in Brunswick and Heidelberg, Germany, and was assistant professor of mineralogy and petrography in Harvard from 1888 to 1901. In November 1901 he was appointed assistant in petrography and chemistry in the United States Department of Agriculture. He has published 'Dissertation on Basalts of the Fichtelgebirge, Bavaria' (Heidelberg), and numerous papers in the bulletins of the U. S. Geological Survey and the U. S. Department of Agriculture, and in periodicals.

Lord, Eleanor Louisa, American educator: b. Salem, Mass., 27 July 1866. She studied in Smith College and in Bryn Mawr College, in America, and in Newnham College, Cambridge, England; and was fellow in history in Bryn Mawr, 1889-95. She taught in the Malden, Mass., High School, 1887-9; in Smith College, 1890-4; and in the Woman's College, Baltimore, after 1897. She has published 'Industrial Experiments in the British Colonies of North America' (1898).

Lord, James Brown, American architect: b. New York 26 April 1859; d. there 1 June 1902. He was graduated from Princeton in 1879 and after studying architecture practised his profession in his native city, where he designed the Appellate Court in Madison Square, the first of the Carnegie branch libraries, and 16 of the other 65. He was chosen as architect of the Memorial Building erected by the class of 1879 of Princeton.

Lord, John, American historian and lecturer: b. Portsmouth, N. H., 10 Sept. 1812; d. Stamford, Conn., 15 Dec. 1894. He was graduated from Dartmouth in 1833; studied theology for a time at Andover Theological Seminary,

and though not ordained to the ministry occupied Congregational pulpits in New Marlboro and Stockbridge, Mass. After 1840 he devoted himself to literary work, and lecturing. In 1843-6 he was in England, giving lectures on the Middle Ages, and on his return to the United States continued to lecture for many years in the principal towns and cities, giving over 6,000 lectures in all. From 1866-76 he was lecturer on history at Dartmouth College. His lectures were published under the title 'Beacon Lights of History' (1883); he also wrote: 'Modern History for Schools' (1850); 'The Old Roman World' (1867); and 'Ancient States and Empires' (1869).

Lord, John King, American educator: b. Cincinnati, O., 21 Oct. 1848. He was graduated at Dartmouth College in 1868. In 1869 he was made a tutor in Latin in Dartmouth; professor of Latin and rhetoric, 1872-80; professor of oratory and belles lettres, 1880-2; associate professor, 1882-92, and after 1892 professor of the Latin language and literature. He has edited many Latin text books and Chase's 'History of Dartmouth College' (1891), is the author of an 'Atlas of the Geography and History of the Ancient World' (1902), and has translated Hertzburg's 'Geschichte der Römer im Alterthum' (1902).

Lord, Nathaniel Wright, American chemist and mineralogist: b. Cincinnati, O., 26 Dec. 1854. He was graduated at the Columbia School of Mines in 1876. Since 1883 he has been chemist for the Ohio Geological Survey and the Ohio State Department of Agriculture, and since 1888 professor of metallurgy and mineralogy in Ohio State University. He is the author of 'Notes on Metallurgical Analysis,' and of numerous papers on scientific subjects.

Lord, William Frewen, English historical writer: b. Brighton, Sussex, 23 Feb. 1861. He was educated at Trinity College, Cambridge, was attached to the Bombay civil service 1881-9, and has been lecturer on and professor of modern history at the Durham College of Science, Newcastle-on-Tyne, from 1899. He has published: 'The Lost Possessions of England' (1895); 'Lost Empires of the Modern World'; 'Life of Sir Thomas Maitland' (1897); 'Development of Political Parties under Queen Anne' (1900); 'England and France in the Mediterranean' (1901).

Lord, William Paine, American soldier and diplomatist: b. Dover, Del., 1838. He was graduated at Fairfield College, N. Y., in 1860, and at the Albany Law School in 1866. In the Civil War he served as major of Delaware cavalry, and as judge-advocate on the staff of General Lew Wallace. After the war he was given a lieutenancy in the regular army, and served at Forts Alcatraz and Steilacoom and in Alaska, resigning in 1868. Since then he has practised law at Galem, Ore., was a State senator in 1878, and for 14 years sat on the Supreme bench of the State. He became governor of Oregon in 1895, and at the expiration of his term in 1899 was appointed United States minister to Argentina. This position he still (1903) continues to hold.

Lord Chamberlain, an officer in England who has control of the establishment attached to the chapels royal; of officers and servants attached to the royal chambers, except of those of

LORD HOWE ISLANDS — LORD'S PRAYER

the bedchamber; and over the medical men of the household. He appoints royal tradesmen, directs all great royal ceremonies, receives all applications to attend levées and drawing-rooms, superintends the royal wardrobe and the jewel house at the Tower, and licenses theatres and plays, his power extending to the cities of London and Westminster, and certain other parts of the metropolis, as well as to those places within which the sovereign may reside occasionally.

Lord Howe Islands, a group of small islands in the Pacific Ocean; nearly 500 miles east of Australia. They are of volcanic origin; and are nearly 3,000 feet above the sea. The group was discovered in 1788 by Lieutenant Ball, but was not colonized until 1840, when New South Wales was given charge of the government. In the surrounding waters there is an abundance of fish. The flora is beautiful and varied, banyan trees are conspicuous.

Lord Lieutenant, a British official of high rank, representing the sovereign, as: (1) The Viceroy, or Lord-lieutenant of Ireland, who is a member of the ministry, and retires from office on the resignation of the Cabinet. His power is quasi-regal; thus he can confer knighthood. In his government he is assisted by a privy council nominated by the sovereign. (2) The lord-lieutenant of a county, the principal official of a county, at whose nomination all deputy-lieutenants and justices of the peace are appointed, and first commissions in the yeomanry, militia, and volunteers are given.

Lord-Mayor's Day, the 9th of November, on which a great procession accompanying the newly elected Lord Mayor of London from Westminster to Guildhall takes place. The procession, formerly famous for its historical and allegorical devices, notably the huge wooden effigies called Gog and Magog, has now much dwindled.

Lord of the Isles, a title borne by chiefs who ruled the western islands of Scotland. They were descended from Somerled, the Lord of Argyll, on whom David I. conferred the islands of Arran and Bute after he had driven the Norwegians out. John, fourth and last Lord of the Isles, was deprived of his title and estates by the Parliament of May 1493. In 1540 the Lordship of the Isles was annexed to the Scottish crown, and from it the Prince of Wales derives one of his titles.

Lord Ormont and His Aminta, a novel, by George Meredith, published in 1894. In this tale the author's enigmatical laughter sounds louder than usual; possessing at the same time a quality which leaves the reader in doubt whether the mirth is at his expense or at the expense of the characters.

Lord's Day. See SABBATH.

Lords, House of. See PARLIAMENT.

Lord's Prayer, **The**, sometimes called "Our Father" or the "Pater Noster," from the first two words in English or in Latin; and called the "Lord's Prayer" because taught by our Lord to his disciples. The prayer is given in the Bible, in Saint Matthew vi., and in Saint Luke xi. The prayer is given as a model, and in Matthew is introduced by the words: "After this manner therefore pray ye." In Luke the introduction is: "When ye pray say," and is fol-

lowed by the words. There is a difference in the form as given in the two gospels mentioned. In Matthew the words are: "Our Father who art in heaven, hallowed be thy name; thy kingdom come; thy will be done as in heaven so upon earth. Give us to-day our daily bread; and forgive us our debts, as we also have forgiven our debtors; and lead us not into temptation; but deliver us from evil. Amen." In Luke the words are: "Father, hallowed be thy name; thy kingdom come. Give us day by day our daily bread; and forgive us our sins; for we also forgive everyone indebted to us; and lead us not into temptation."

The doxology, "For thine is the kingdom, and the power, and the glory for ever, Amen," is not found in many of the best ancient authorities, and for that reason it is omitted in Tischendorf's eighth edition of the New Testament and in the Westcott and Hort Greek New Testament.

The prayer was introduced or taught in the "Sermon on the Mount," and as given in Matthew, consists of nine parts—one salutation or invocation, seven petitions, and "Amen." In the salutation there are three distinct points; first, the word "Father," implying fatherhood, sonship, children of. Second, the word "Our," which includes all mankind, a profession of brotherhood, a manifestation of charity in the most effective manner. Third, "Heaven," where God is in His glory, for where His glory is revealed that is heaven. The seven petitions are usually divided into three parts. The first three petitions refer to the honor of God; the last three to our own advantage; and the fourth petition has an element of both the first and the last groups. The first petition is, "Hallowed be thy name," because by the name of a thing we express the object itself. "Hallowed be," or as expressed by the Greek, "Sanctified be," thy name among men—thy external glory throughout the whole world. The second petition is, "Thy kingdom come,"—internally and externally without any limitations. The third petition is, "Thy will be done as in heaven so upon earth," which relates to free co-operation of our wills with the will of God; that obedience here will be as perfect as in heaven, that perfect peace may reign on earth. The fourth petition is, "Give us to-day our daily bread." Various authorities differ as to the exact meaning of the word qualifying bread, some holding that it makes the word bread mean spiritual food alone, others, bodily food, necessary food for the body; others that it implies food for both soul and body. The fifth petition is, "And forgive us our debts (trespasses) as we also have forgiven our debtors (those who have trespassed against us). The petitions preceding related to something good to be obtained; the fifth petition relates to deliverance from evils. The word translated "debts" or "trespasses" is translated "sins" in the gospel of Luke. This petition asks that both the forgiveness and the perfection of the forgiveness on the part of God will correspond to our forgiveness of our enemies. The sixth petition is, "And lead us not into temptation." The seventh petition is, "But deliver us from evil." The word "but" in this place, confirms what has been said and forms the transition to what follows. Differences of opinion have existed as to the meaning of the word "evil," some authorities regarding it as meaning the "evil one," others as

LORDS SPIRITUAL

moral evil, anything that hinders spiritual progress. The fifth petition relates to freedom from sin, the sixth to deliverance from sin, the seventh to warding off all spiritual dangers. The "Amen" is a common ending to prayer, usually derived from the Hebrew verb meaning "to be firm," or from a Hebrew noun meaning "truth," and commonly rendered "so be it" or "may it be so." In this place its signification is usually regarded as meaning a stronger confirmation of what has just been said. In places in the liturgy of the Roman Catholic, the Protestant Episcopal, and the Greek churches where the word "Amen" occurs, it is usually said by the server or clerk; but the "Amen" belonging to the "Lord's Prayer" is said by the celebrant of the mass.

Some of the early writers divided the petitions into six, thus joining the sixth and seventh. Many Protestant writers make this division, but Roman Catholic writers follow Saint Augustine, and divide the prayer into seven petitions. Lutheran writers generally follow this division, also the Protestant writers, Bleck, Hilgenfeld, Keil, and Tholuck. The gradation of the petitions is remarkable: First, the honor and glory of God is sought; second, our own greatest good; third, the necessary means to attain eternal life; fourth, necessities for the present life; fifth, to be freed from the greatest evil; sixth, to be freed from the evil next to the greatest; seventh, to be freed from all evil. The fifth, sixth, and seventh petitions are directed against the respective impediments opposed to the good mentioned in the second, third, and fourth petitions.

The doxology is explained in various ways; as a liturgical addition, as an ancient continuation used by the priests and then the people. The "kingdom" in the doxology seems to refer to the first and second petitions; the "power" to the third petition; and the "glory" to the following petitions.

Directly following the "Lord's Prayer," in the gospel of Saint Matthew vi. 14, there is an extension or explanation of the fifth petition, giving again the conditions of forgiveness; "For if ye forgive men their trespasses, your heavenly Father will also forgive you."

Commentators differ as to the exact relation between the form of the "Lord's Prayer" in the gospel of Matthew and in Luke. It is held by many authorities that the prayer was taught on two different occasions, to different persons, except the apostles who were present on both occasions. Both forms were given as models, and both contain the essentials. The prayer occurs in all ancient liturgies except the so-called Clementine liturgy—given in the Apostolic Constitutions. In all the principal liturgies it occurs shortly before Communion.

Many polyglot collections of the prayer have been published from the 16th century downward, the most remarkable of which were those of John Chamberlayne in 150 languages (1715), of Conrad Gesner in 200 (1748), and that of Padre Hervaz in 307 (1787). There are expositions of the Lord's Prayer by Origen, Chrysostom, Gregory Nyssa, Cyprian, Luther, Leighton, and Tholuck.

Bibliography.—Maas, 'The Gospel According to Saint Matthew'; Kenrick, the gospels of Saints Matthew and Luke in 'The Four Gospels'; Saint Thomas Aquinas, 'The Lord's

Prayer'; and the following authors in various writings, Bleck, Meyer, Kiel, Schanz, Spirago, Tholuck, W. Grimm, Hilgenfeld, Peischel, Saint Augustine, and Saint Alphonsus.

Lords Spiritual, in Great Britain, archbishops and bishops of the Anglican Church, who are given seats in the House of Lords. The present primate of all England, who is the 95th Archbishop of Canterbury, was nominated by King Edward soon after the death of Queen Victoria, and stands at the head of the Lords Spiritual. Among the most important and least known of the prerogatives of the Archbishop of Canterbury, is that of heading the commission of great dignitaries of the realm who form a species of council of regency in the event of any time intervening between the demise of a sovereign and the assumption of the reins of government by his successor. The Archbishop of Canterbury, in addition to an official residence within the cathedral precincts at Canterbury, and a stately palace in London, possesses a stipend of \$75,000 a year. But few are aware of the sources from which this money is derived. It does not form part and parcel of the supplies voted every year by Parliament for the administration of the government. Nor is it derived from the revenues of the state, that is to say, from the pockets of the taxpayers. The Church of England is enormously rich. Not all ecclesiastical property was diverted from religious uses at the time of the Reformation. Much of it was left to endow the Church of England, and to-day the annual income of the latter is estimated at near \$40,000,000, the administration of which is vested in the hands of a body known as the Ecclesiastical Commissioners, who pay to the archbishops and bishops their stipends, provide salaries for the minor dignitaries of the Church, and spend the remainder in improving the parochial endowments and buildings, and in providing funds for additional clergy. The Ecclesiastical Commission consists of the two archbishops, namely, of Canterbury and of York, of all the bishops of English and Welsh dioceses, of the deans of Canterbury, St. Paul, and Westminster; of five cabinet ministers, three judges of the High Court of Judicature, and twelve laymen, all of them churchmen of the Church of England, two being appointed by the Archbishop of Canterbury and the remainder by the crown.

The Commissioners have the power of creating new bishoprics, deaneries, and archdeaconries, of creating new parishes, of uniting existing ones, etc. But any of the more important steps which they take have to be ratified by the king and council, that is to say, by the sovereign sitting with a quorum of his Privy Council, and when thus ratified the acts of the Ecclesiastical Commissioners have the power of an act of Parliament.

The Archbishop of Canterbury, like the Archbishop of York and the 24 bishops who represent the Established Church in the House of Lords, is not a peer of the realm, but only a Lord Spiritual of Parliament. The Lords Spiritual have no right to demand trial by the House of Lords as peers, but are amenable to the jurisdiction of the ordinary courts of law. Although the Lords Spiritual of the upper house are distinct from the Lords Temporal, they do not vote separately, but jointly, forming for purposes of legislation one estate. The prelates vote on every subject

LORD'S SUPPER

brought before the Lords, except in trials for high treason and other cases of a criminal nature. On such occasions they never attend or vote; this, however, being in deference to those canon laws which forbid them from participating in matters of blood, and not owing to any parliamentary requirement. There can be no quorum of the House of Lords without the presence of an archbishop or bishop, two peers and a prelate being needed to constitute a House of Lords for the transaction of business, and the Spiritual Lords cannot vote or even take their seats in the House unless robed in their ecclesiastical vestments, with rochet, lawn sleeves and mortar-board cap complete. The discrimination between the peers of the realm and the Lords Spiritual of Parliament also extends to the families of the latter.

Lord's Supper (Lat. *Cena Domini*, Fr. *La Sainte Cène*, Ger. *Abendmahl*), one of the sacraments of the Christian religion, in the observance of which Christians commemorate the death of the Founder of their religion. It is so called because the Lord Jesus Christ instituted the rite when he took his last meal with his disciples. It has also the names of *eucharist* and *communion*, and is celebrated by all Christian bodies however much their views may differ as to its nature and virtue, except the Quakers. It was instituted at the time of the Jewish pass-over, as we read in the gospels of Matthew, Mark, and Luke, the two former agreeing very closely in their accounts, while that of Luke has features of its own. A brief statement to the same effect is in 1 Cor. xi. There is no corresponding section in the fourth gospel, though in John vi, Christ speaks of the eating of his flesh and the drinking of his blood. In all the churches founded by the apostles the Lord's Supper was introduced. In the 1st and 2d centuries this rite was celebrated in connection with the *agapæ* or *love-feast*. After the third century when the congregations became more numerous, the *agapæ* ceased, and the Lord's Supper was from thence celebrated separately in the churches, in such a way that all present could partake, with the exception of catechumens (that is, Christians not yet baptized) and unbelievers. These were obliged to withdraw when the celebration of the Lord's Supper commenced, because communion was considered as a mysterious act, which was to be withheld from profane eyes. The deacons carried the bread of life to those whom sickness or imprisonment had prevented from being present at the meeting of the congregation. It was always believed to possess a peculiar efficacy, and ideas of the awful and mystical were associated with it. From the first, Christians ascribed supernatural power to the rite, and the consecrated bread and wine were regarded as more than mere bread and wine, and as having become, in some mysterious way, the body and blood of our Saviour. In the early Church we find no scientific formulation of the change undergone by the sacred elements, but in the 9th century, in consequence of the attacks of Berengarius (q.v.) on the doctrine of the Real Presence, the term, transubstantiation, commonly ascribed to Paschasius Radbertus first, came into use to describe metaphysically the real and objective change of the elements of bread and wine into the body and blood of Christ. This term was

adopted by the Council of Rome in 1079, and confirmed in 1215, in the Fourth Lateran Council, by Innocent III., and has ever since been employed by the Roman Catholic Church as the proper expression of her faith in the Eucharist. The Council of Trent in the 16th century laid it down as of faith to confess the "change of the whole substance of the bread into the body, of the whole substance (*substantia*) of the wine into the blood [of Christ], only the appearances (*species*) of bread and wine remaining; which change the Catholic Church most fitly calls Transubstantiation." The Roman Catholic Church holds that the Eucharist has been both a sacrament and a sacrifice from the beginning. This, she declares, is evident from Christ's words of institution, as narrated in the synoptic gospels and from St. Paul's words in his first Epistle to the Corinthians. And unbroken testimony from the Apostles through the Fathers of the Church, she further avers, bears ample evidence to her claim; besides this, she claims that her own witness as the duly divinely appointed guardian of the deposit of revelation and its infallible interpreter commissioned to teach all nations, is sufficient seal to the truth of the doctrine. As a sacrament it is the true body and blood of Christ under the appearance of bread and wine to be partaken by the faithful as a means of grace and union with Christ; as a sacrifice it is the unbloody oblation of the body and blood of Christ by a duly appointed minister, that is, priest, by whom alone the elements can be consecrated. Such she declares has been the Christian teaching and practice from the beginning. The reception of the sacrament under both kinds, that is, under the forms of both bread and wine, was general until the Middle Ages, when communion under one kind, bread alone, began to be adopted, partly to avoid the danger of spilling the consecrated wine and partly to counteract a growing heresy that Christ was not received whole and entire under either kind alone. The Council of Constance, in the 15th century, made it universally obligatory to communicate under one kind to meet the heresy of Huss and Jerome of Prague. The Protestant reformers in the 16th century averred that the Church had deviated in the celebration of the Lord's Supper from the purpose of Christ and the example of the apostolic age, and both the German and Swiss reformers agreed in rejecting the doctrine of Transubstantiation and the mass, and maintaining that the Lord's Supper ought always to be celebrated before the whole congregation, and with the administration of both bread and wine. In explaining the words by which the supper was instituted, Luther and Zwinglius differed, and their different opinions on this subject formed the principal subject of the dissension between the Lutheran and Calvinistic churches. Luther took the words, "This is my body," etc., in their literal sense, and thought that the body and blood of Jesus Christ were united, in a mysterious way, with the bread and wine, which, however, remain unchanged, so that the communicant receives, in, with, and under the bread and wine, the real body and blood of the Redeemer. Zwinglius, on the other hand, understood the words in a figurative sense, and supposed that Jesus Christ meant to say, "The bread and the wine represent my body and my blood," and maintained,

therefore, that the bread and wine were mere signs of the body and the blood of Christ, and that the Lord's Supper was a mere commemoration of the death of Christ, and a profession of belonging to his church, and this view was in substance adopted by the Socinians and Arminians. From this difference of opinion arose a violent dispute between Luther and Zwinglius, which in later times has been continued between the Lutheran and Calvinistic divines. The opinion advanced by Calvin, by which a spiritual presence of the body and blood of Christ is supposed in the communion, by partaking of which the faithful receiver is brought into union with Christ, through the medium of the Holy Ghost, though it came nearer to the Lutheran doctrine than that of Zwinglius did, yet was essentially different, and therefore also met with a strong opposition from the strict adherents of Luther. Melancthon inclined to the Calvinistic notion, and so did many other Lutheran divines, who were called by the opposite party Philippiasts and Crypto-Calvinists. The *formula concordiæ*, or articles of religious peace, suppressed the Crypto-Calvinists in the greatest part of the Lutheran Church, and established the idea of Luther, consequently there was a final separation of the Lutheran and Reformed or Calvinistic churches, but in recent times many Lutheran divines have inclined to the Calvinistic doctrine. The Greek Church has substantially held the doctrine of Transubstantiation in its whole extent. The Oriental Christians differ from the Western, in using leavened bread in the Lord's Supper, and in administering it to children. (See GREEK CHURCH.) It thus appears that the differences between the contending churches hinge on the *mode* in which the body and blood of Christ are present in the elements of bread and wine, for that they are in some way present is admitted by them all. The Protestant churches hold that *presence* means presence in efficacy, and will admit that it is "real" in the sense of being efficacious, though not in the sense of being corporeal. However, when they are called on to define efficacy they differ in this, that some mean by it a sacrificial, and others a mysterious supernatural efficacy, emanating from Christ's glorified body. The confessions of the Protestant churches were framed expressly to conciliate the Lutherans, and contain, in consequence, more of the mystical element than is consistent with the sentiments of the framers, as expressed in their writings. The 28th article of the Church of England, while repudiating Transubstantiation as "repugnant to the plain words of Scripture," declares "that to such as rightly, worthily, and with faith receive the same, the bread which we break is a partaking of the body of Christ, and likewise the cup of blessing is a partaking of the blood of Christ." It further declares that "the body of Christ is given, taken, and eaten in the supper only after a heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the supper is faith." The Westminster Confession, chap. xxix., s. 6 and 7, thus formulates the doctrine adopted by the Presbyterian Church of Scotland, which in the main agrees with that propounded by Calvin: "That doctrine which maintains a change of the substance of bread and wine into the substance of Christ's body and blood (commonly called Transubstantia-

tion) by consecration of a priest, or by any other way, is repugnant not to Scripture alone, but even to common sense and reason, overthroweth the nature of the sacrament, and hath been and is the cause of manifold superstitions, yea, of gross idolatries. Worthy receivers, outwardly partaking of the visible elements in this sacrament, do then also inwardly by faith, really and indeed, yet not carnally and corporally, but spiritually, receive and feed upon Christ crucified, and all benefits of his death: the body and blood of Christ being then not corporally or carnally in, with, or under the bread and wine; yet as really, but spiritually, present to the faith of believers in that ordinance, as the elements themselves are to their outward senses." The elevation, adoration, and carrying about of the host, practised in the Greek and Roman Catholic churches is thus spoken of in the 28th article of the Anglican Church: "The sacrament of the Lord's Supper was not by Christ's ordinance reserved, carried about, lifted up, or worshipped." While the Roman Catholic Church makes its communicants receive the consecrated wafer with the mouth from the hands of the priest, the Protestant churches put the bread and the chalice into the hand of the communicant.

Lordwood. See LIQUIDAMBAR.

Lorelei, lô'rê-lî, o **Lurlei,** loor'li, a rock in the Rhine, near St. Goar, about 425 feet above the river. Once a serious menace to passengers on the river and always famed for its echo, the rock has been personified by German poets, notably Heine, as a siren, luring sailors to destruction by the music of her voice, an evident idealization of the danger of the rock and of its echo.

Lorente, Sebastian, sã-bãs-tî-ãn lô-rên'tê, Peruvian historian; b. about 1820; d. Lima November 1884. He was a professor of history at the University of San Marcos from 1845 and made valuable contributions to the historical literature of his country in his 'History of Peru' (5 vols., 1860); 'History of the Conquest of Peru' (1861); and articles in the 'Peruvian Review.'

Lorenz, lô'rênts, Adolf, Austrian orthopædic surgeon; b. 1854. He was graduated from the University of Vienna in 1880, and worked as an assistant under Theodor Billroth in Vienna. On the advice of the latter he began specialization in orthopædic surgery, and after years of study developed his so-called "bloodless" method of reducing congenital dislocation of the hip joint. Before he developed his own method of operation he was one of the chief exponents of Hoffa's cutting method, which, however, he modified largely. His operation consists of the forcible stretching of all the soft parts about the hip until the head of the bone can be brought to the place where the socket should be (the acetabulum), and then holding it in that position and rotating the joint to secure it in the depression of the acetabulum. A plaster of paris cast is worn by the patient from six to nine months after the operation. Dr. Lorenz has performed this operation successfully in a large percentage of his cases; he demonstrated his method before the Medical Congress at Berlin in 1895; and has also given demonstrations in England and the United States. His visit to the United States (1902) aroused widespread interest and enthusiasm. He

is now (1904) professor of orthopaedic surgery at the University of Vienna and a government councillor. His publications include: 'Orthopädie der Hüftgelenks-Kontrakturen und Ankylosen' (1889); 'Das instrumentelle kombinierte Redressement der Hüftgelenks-Kontrakturen' (1898); and 'Ueber die Heilung der angeborenen Hüftgelenks-Verrenkung durch unblutige Einrenkung und funktionelle Belastung' (1900).

Lorenz, lō'rentz, Ottokar, German historian: b. Iglau 7 March 1832. His first work was 'The Consular Tribunal' (1855). He was appointed professor of history in the University of Vienna, 1862, and in 1885 accepted a call to the University of Jena. Among his writings are: 'German History in the 13th and 14th Centuries' (1863); 'Sources of Mediæval German History' (1870); 'History of Alsace,' with Scherer (1871); 'History and Politics' (1876); 'Genealogical Manual of the History of European States' (1895).

Lorenzo, lō-rēn'so, or Lourenço Marques, lō-rān'sō mār'kēs, East Africa, a Portuguese province and port, the latter on Delagoa Bay, and the seacoast terminus of the railway to Pretoria in the Transvaal Colony, completed in 1895. A considerable import and export trade is carried on. Pop. (1898) 6,630, of whom 5,130 are Europeans. See DELAGOA BAY.

Loreto, lō-rā'tō, Italy, city in the province of Ancona; about five miles from the Adriatic Sea and 15 miles south of the city of Ancona. It is situated in a fertile agricultural region, remarkable for its beautiful scenery. The city is known for its possession of the Santa Casa, said to be the house in which Jesus, Mary, and Joseph lived while in Nazareth. The building is 31 feet in length and 13 feet in width. It is enclosed in a stately domed church, the work of Bramante, and stands under the dome. The original outer walls have been covered, but inside the coarse stonework of the original masonry is visible. The material is a dark reddish-colored stone, unlike the stone in the vicinity. The tradition is that after the power of the Christians was destroyed in Palestine, by the capture of Acre, in 1291, on 10 May 1291, angels moved this house from Nazareth to the hill of Tersatta, near Fiume. After a time, on 10 Dec. 1294, the house was again removed by angels to the opposite side of the Adriatic, near Recanati; and again, in 1295, it was removed to where it now stands. Consult: Caillu, 'Histoire, Critique et Relig. de N. D. de Lorette' (1843); Hutchinson, 'Loreto and Nazareth' (1863); Jerome Angelita, 'Historie della Translatione della Santa Casa'; Kenrick, 'The Holy House of Loreto'; Meyrick, article on Loreto in 'Christ, Remembrances'; Stanley, 'Sinai and Palestine'; Zucchi, 'Istoria di Loreto.'

Loreto, Peru, an interior department watered for thousands of miles by the Marañon and its tributaries; area, 288,456 square miles; pop., chiefly Indians, 1896, 100,596. The quickest route from the coast to this province, which is only about 700 miles distant in a direct line, is round the northern coast of South America and up the Amazon, a journey of 6,500 miles. Loreto is separated from the coastal departments by the Andes, has a tropical climate, and is densely forested; the chief products are rubber and salt. The principal towns are Moyobamba

(the capital, pop. 10,000), Tarapoto, and Iquitos.

Lorette, Ancienne, ān-sē-ēn lō-rēt, Quebec, Canada, a village seven miles southwest of Quebec city, with industries connected with the waterworks of Quebec. Pop. 1,600. Three miles to the north is INDIAN or JEUNE LORETTE, peopled by about 300 Christianized Indians, descended from the last of the Huron Indians who had found a refuge at Ancienne Lorette in 1650. The settlement was removed to Jeune Lorette in 1697. Jeune Lorette commands a fine view of Quebec for which it is visited, as also for the falls of Lorette, and for its ancient chapel and statue of the Virgin, a replica of those at Loreto, Italy.

Loria, lō'rē-ā, Achille, Italian economist: b. Mantua 1857. He studied law at Bologna, and proceeding successively to Rome, Berlin, and London, made a study of economical problems. In 1881 he was appointed professor of economics at Siena and 10 years later at Padua. He has approached the subject of wealth distribution and land-tenure in a hopeful spirit of optimism, and has published many works on the subject. Among his writings are: 'Studi sul Valore della Moneta' (1891); 'La Terra ed il Sistema sociale' (1892); 'La Costituzione economica odierna' (1899); and 'Il Capitalismo et la Scienza' (1901).

Lorica'ta. In zoology, (1) the group of pagolins (see MANIS); (2) the group of *Crocodilia*; (3) a group of decapod *Crustacea*, which includes the spiny lobsters (*Palinurus*, etc.), and the bear-crabs (*Scyllarus*, *Ibacus*, etc.). These forms are large, with thick shells and without pinching claws. All are edible, the spiny lobster replacing the true lobster as an article of food in the warmer parts of the earth.

Lorient, lō-rē-ōn, or L'Orient, France, a fortified seaport town, in the department of Morbihan, at the mouth of the Scorff, on the Bay of Biscay; about 40 miles west of Vannes. It was founded in 1666 by the East Indies Company, and in 1690 it became a military fort. After the dissolution of the company, in 1782, the government bought the ship-building plant. The large harbor can accommodate with safety a great number of vessels. Lorient is a station of the French fleet, and has extensive docks and building yards for the construction and fitting out of war vessels. It has, also, large artillery barracks, an artillery park, and a marine arsenal. It has an observatory, schools of marine, artillery, and hydrography, and other educational institutions, and a large number of manufacturing establishments. About five miles south of Lorient is the fortified town of Port Louis.

Lorikeet, a small kind of lory (q.v.)

Lorimer, lōr'ī-mēr, George Claude, American Baptist clergyman: b. Edinburgh, Scotland, 1838; d. Aix-les Bains, France, 7 Sept. 1904. He came to the United States in 1856 and was educated at Georgetown College, Ky. In 1859 he was ordained to the Baptist ministry, and held pastorates at Harrodsburg, Paducah, and Louisville, Ky.; he was then at Albany for a short time, at the Shawmut Avenue Church and Tremont Temple in Boston in 1870-9; and in Chicago till 1891. In the latter year he returned to Boston to become pastor at Tremont Temple. In 1902 he went to New

York as pastor of the Madison Avenue Church. He was associate editor of the 'Watchman' and has written 'Isms Old and New' (1882); 'Under the Evergreens' (1872); 'The Great Conflict' (1876); 'Studies in Social Life' (1886); 'Christianity and the Social State'; 'Christianity in the Nineteenth Century'; 'Messages of To-day to the Men of To-morrow' (1897); and a 'Master of Millions' (1903), a story of modern life.

Lorimer, George Horace, American journalist: b. Louisville, Ky., 6 Oct. 1868. He is a son of G. C. Lorimer (q.v.), and was educated at Colby College, and at Yale. Entering the field of journalism, he advanced steadily in his profession, and since 1899 has been editor-in-chief of the 'Saturday Evening Post,' Philadelphia. He has written 'Letters from a Self-made Merchant to his Son' (1902).

Lorimer, John Henry, English painter: b. Edinburgh 1856. He was educated at the Edinburgh Academy and University, and began his art studies at the Royal Scottish Academy. One of his pictures was admitted to the annual exhibition of that institution when he was but 19. His most important exhibited pictures are 'The Ordination of Elders'; 'Pot Pourri'; 'The Eleventh Hour' (1896), which received a second class medal at the Salon, and in 1890 was awarded a gold medal at the Paris Exposition. In 1894 the French government bought his 'Benedicite,' which is now in the Luxembourg, where his portrait of Colonel Anstruther Thompson has also been deposited.

Lorimer, Norma Octavia, Scottish novelist: b. Auchterarder, Perthshire, 1864. She has been an extensive traveler, having spent three years in the United States, and has written 'Josiah's Wife'; 'By the Waters of Sicily' (1901); 'Catherine Sterling' (1902); etc.

Loring, lör'ing, Charles Greeley, American lawyer and orator: b. Beverly, Mass., 1794; d. 1868. He was graduated from Harvard in 1812 and practised his profession in his native city, becoming in 1857 actuary of the Massachusetts Hospital Life Insurance Co. In 1862 he entered the State senate. He was of much prominence as an orator and was the author of 'Neutral Relations between the United States and England' (1863); 'Life of William Sturgis' (1864).

Loring, Charles Greeley, son of the preceding: b. Boston 1828; d. Pride's Crossing, Beverly, Mass., 20 Aug. 1902. He was graduated from Harvard in 1848 and served in the Union army during the Civil War, being brevetted major-general of volunteers at its close. He became a trustee of the American Museum of Fine Arts in 1873 and was the executive officer of the institution from 1876 until his death.

Loring, Edward Greeley, American jurist: b. Massachusetts 1802; d. 1890. He was graduated from Harvard, and for many years was probate judge and United States Commissioner in Boston. While holding this post he sent back into slavery the negro Anthony Burns, and for this act was removed from the bench. In after years he was appointed by President Lincoln judge of the Court of Claims, which post he resigned in 1877.

Loring, Ellis Gray, American lawyer: b. Boston 1803; d. 1858. He was educated at the Boston Latin School, entered Harvard in 1819,

but without graduating left college and studied law. In 1827 he was admitted to the bar, where he soon won high distinction. He was one of the first pleaders for the abolition of slavery, and one of the founders of the first anti-slavery society, in Boston, 1832, whose constitution he wrote. As a defender of fugitive slaves he gave freely of his time and talents, and shared the odium visited upon all the early abolitionists. Before the Supreme Court of Massachusetts he made a memorable defense of a slave-child called Med, by which, against so formidable an opponent as B. R. Curtis (q.v.), he secured a decision declaring that every slave brought into that State thereby became legally free. The effect of his convincing argument was both instantaneous and lasting, and his triumph was a substantial service to the anti-slavery cause. He published numerous addresses on the slavery question.

Loring, George Bailey, American agriculturalist: b. North Andover, Mass., 8 Nov. 1817; d. Salem, Mass., 14 Sept. 1891. He was graduated from Harvard in 1838 and from the Harvard Medical School in 1842, and after several years of medical work at the Chelsea Marine Hospital devoted himself from 1850 onward to scientific agriculture, writing many essays and papers on farming and allied topics. He became famous as an orator, served several terms in the Massachusetts legislature, was member of Congress 1876-81, United States commissioner of agriculture 1881-5, and minister to Portugal 1889-90. He was president of the Massachusetts State Agricultural Society for many years.

Loring, William Wing, American general: b. Wilmington, N. C., 4 Dec. 1818; d. 30 Dec. 1886. He entered the United States army as a private in a troop of volunteer cavalry, and was active in the Florida war in 1835-42. During the war with Mexico he was distinguished for bravery at Contreras, Churubusco, and Chapultepec, and was brevetted lieutenant-colonel and colonel. Although opposed to secession he held States Right views and in May 1861 resigned his commission and became a brigadier-general in the Confederate army and later major-general. For a few years after the close of the war he was a banker in New York, then went to Egypt in 1869 and was made a pasha and chief of staff in the army of the Khedive. In 1879 he returned to the United States and published a description of his Oriental experiences in 'A Confederate Soldier in Egypt' (1883).

Loris. See LEMUR.

Loris-Melikoff, lō'ris-mēl'ī-kōf, Mikhail Tarielovitch Tainoff, COUNT, Russian soldier and statesman: b. Tiflis, Russia, 1 Jan. 1826; d. Nice, France, 22 Dec. 1888. He was of Armenian descent, entered the army in 1843, and distinguished himself at the siege of Kars in 1854. He served in the Crimean war and was made lieutenant-general in 1863. In the Turco-Russian war of 1877 he took Kars in November and for his services in the campaign was made a count in 1878. In 1880 he was appointed minister of the interior, in which post he showed a tendency toward liberal measures, but on the accession of Alexander III. his position became untenable, and he resigned.

Lorna Doone, lōr'na doon, a romance of Exmoor, a famous novel by R. D. Blackmore,

published in 1869. It is its author's best-known work, and its popularity has been equally great on both sides of the Atlantic. Much as Hardy acquaints us with Wessex, Blackmore impresses Exmoor upon us. It is out-of-door England, with swift streams, treacherous bogs, dangerous cliffs, and free winds across the moors.

Lorne, Iörn, MARQUIS OF (JOHN GEORGE DOUGLAS SUTHERLAND CAMPBELL). See ARGYLE, CAMPBELLS OF.

Lorraine, Iö-rân'. See ALSACE-LORRAINE.

Lorraine, Claude. See CLAUDE LORRAINE.

Ló'ry, any of several East Indian parrots, but more especially one of the brush-tongued family *Trichoglossidæ*, the smaller examples of which go by the name of lorikeets. Both the lories and the lorikeets are remarkable for their extensible tongue, furnished with a pencil at its extremity, by which they are enabled to lick up the nectar of flowers. The lorikeets are smaller than the lories, and have long tapering tail-feathers. Swainson's lorikeet (*T. nova-hollandia*) is the best-known species. It is found in eastern Australia and Tasmania, and is popularly known as the blue mountain lory or the blue mountaineer.

The name lory is also given to the large brilliantly colored parrots of the psittacine genus *Eolectus*. Consult Newton, 'Dictionary of Birds' (1896) and see PARROTS.

Los Angeles, Cal., city, county-seat of Los Angeles County; on the Los Angeles River, about 20 miles from the mouth, and on the Atchison, Topeka & Santa Fé; the Southern Pacific, the Southern California, the Los Angeles & Salt Lake, and the San Pedro R.R.'s.

The pious Spanish pioneers who first introduced civilization in Alta California were in the habit of giving names to places in accordance with the church calendar. Consequently when mass was first celebrated on the present site of the city, it was named *Nuestra Señora Reina de Los Angeles*, which the practical "Yankees," upon their arrival, at once proceeded to shorten to Los Angeles. Los Angeles is situated about 15 miles in an air line from the Pacific Ocean, in the valley of the Los Angeles River, a dry river bed in summer, but in winter sometimes a lively stream, for a short time after a heavy rainfall. There are mountains on the north and west. The city covers a large area of ground, the old city limits embracing an area of six miles in each direction, with the old plaza in the centre. To this area several large additions have been made during the past few years. The average altitude is about 300 feet above sea-level. Every variety of location for a residence may be found within the city limits, about a third of the city being hilly, with commanding views of the surrounding country. Los Angeles was settled in 1781. While the country was a Mexican province, Los Angeles and Monterey alternated as the capital of California.

The city has railroad competition, in the shape of three transcontinental lines, the two Southern Pacific systems, by way of Ogden and El Paso, and the Santa Fé, by way of Albuquerque. Work is now progressing on a fourth system by way of Salt Lake, which will shorten the distance from Los Angeles to Chicago over

200 miles. Altogether, there are a dozen lines of railroads leading to Los Angeles. The Pacific Coast Steamship Company runs vessels every few days from Los Angeles county ports to San Francisco and San Diego.

Los Angeles is an old place, having been founded 4 Sept. 1781, by soldiers from the mission of San Gabriel, under the protection of the Spanish governor. Modern Los Angeles is, however, less than twenty-five years old, for it was not until more than half a century after its founding that it began to take shape as an American city. Since then, its growth can only be described as wonderful. A city that in less than a quarter of a century has increased its population from 11,311 in 1880 to 135,000 (conservatively estimated) in 1903, is certainly something remarkable, even in the rapidly growing West. It is only within the past 20 years that the real growth of modern Los Angeles has taken place. In 1883 the city was a somnolent semi-Mexican pueblo of about 12,000 souls, without any public buildings and with only one private building of architectural pretensions, a considerable proportion of the residences being constructed of adobes, or sun-dried bricks, such as are commonly used in Mexico and oriental countries. The entrance of the railroad brought home-seekers in large numbers to Los Angeles and vicinity; the Atchison, Topeka & Santa Fé Railroad was opened in November 1885. In 1886-7 the record transfers of property amounted to \$100,000,000, prices of outside property in some cases being pushed up to ridiculously high figures. There was, of course, a period of stagnation following the subsidence of this wild speculative movement, but the fact that there was no general crash is a proof that the prosperity of the city was well founded.

There are a dozen public parks within the city limits, aggregating over 600 acres, four of them having lakes of considerable size. Elysian Park, the largest within the city limits, is a wild and picturesque hill tract. To these was recently added, through the beneficence of a citizen, Griffith Park, a picturesque mountainous tract of over 3,000 acres, a short distance north of the city limits. Work has commenced (1903) on a system of boulevards which is intended to connect the various parks. Los Angeles is a city of homes; a large proportion of the people owning their own dwellings. There are many attractive cottages, embowered in climbing plants, roses, heliotrope and vines often covering the entire side of a house, while the lawns are adorned with palms, bananas and other semi-tropical trees. The city is practically frostless, callas, heliotropes, and other delicate plants flourishing throughout the winter in the open air. In the southwestern and western sections of the city are hundreds of handsome mansions, in various pleasing styles of architecture. The residence streets are generally aligned by shade trees, the most popular of which are the pepper, with its bright red berries, and the grevillea, with its feathery yellow blossoms.

There are over 200 miles of graded and graveled streets in the city, 20 miles of paved streets, 350 miles of cement and asphalt sidewalk and 160 miles of sewer, the sewer system extending to the ocean. The city is brilliantly lighted, having been the first city in the United

LOSSING

States to entirely abandon gas for street lighting and replacing it with electricity, which was done over 20 years ago. It is now one of the best lighted cities in the Union, the lights being on tall masts.

The electric street railway facilities are excellent. The total mileage of single track is about 200 miles. In addition to the local electric lines, there are half a dozen suburban lines, extending to various points from 10 to 20 miles from Los Angeles, and work is rapidly progressing on a vast interurban system of electric railroads, that will extend from San Diego on the south to Santa Barbara on the north, each place being about 125 miles from the city. The wealth and general prosperity of Los Angeles are founded largely upon the abundant natural resources. The healthy climate and beautiful scenery attract many visitors and home-seekers. The oranges shipped annually average 20,000 car loads, which bring about \$500 for each car. The following table prepared by the Los Angeles Chamber of Commerce shows the estimated value of the principal products of the seven southern counties—the immediate tributary country of Los Angeles—for 1902. These aggregate \$82,000,000, including \$24,000,000 of miscellaneous manufactured products. The principal items in the list are as follows:

Citrus fruits	\$14,000,000
Gold and silver	5,674,000
Petroleum	6,000,000
Borax	1,274,700
Hay	3,300,000
Vegetables and fruits consumed.....	3,000,000
Dried fruits and raisins.....	2,000,000
Grain	3,000,000
Canned goods	1,500,000
Sugar	3,600,000
Nuts	1,400,000
Cement, clay, brick, sandstone and granite..	1,278,000
Beer	1,000,000
Beans	1,800,000
Pork, beef, mutton—dressed.....	3,234,000
Miscellaneous manufactured products.....	24,000,000

This, however, is only a small portion of the trade products of Los Angeles. The merchants of the city, wholesale and retail, and the manufacturers, do a large and increasing business with a section of country extending from central California to New Mexico. The manufacturing industry has been greatly stimulated by the supply of petroleum fuel at a low price and by the bringing of electricity from the mountain streams a distance of nearly 100 miles. The United States census gave the value of manufactures in Los Angeles for the year ended 10 June 1900 at \$21,297,727, since which time it has vastly increased.

The banks of Los Angeles are noted throughout the country for their generally solid and prosperous condition, with deposits aggregating nearly \$50,000,000. The clearings of the Los Angeles banks for the year 1902 amounted to over \$243,000,000. The value of the buildings erected in Los Angeles during 1902 amounted to nearly \$10,000,000, and for 1903 will be considerably more. The annual municipal expenditures are about \$1,355,000; the chief items of expenses are: for schools, about \$446,000; for the police department about \$130,000; for the street cleaning, \$90,000; for the fire department, \$126,000; for municipal lighting, \$44,000; for parks, \$56,000.

The principal harbor of Los Angeles is at San Pedro, where for several years the govern-

ment has been engaged in constructing a great breakwater that will cost over \$3,000,000, and which will permit the entrance to the harbor of deep-sea vessels, when Los Angeles expects to make a bid for trans-Pacific trade. The city is the seat of the University of Southern California, opened in 1880 by the Methodist Episcopal; a State Normal School; Saint Vincent's College, opened in 1865 by the Roman Catholics; Occidental College, opened in 1887 by the Presbyterians; three academies under the Roman Catholics, a public high school, and public and parish schools. There is a public library of 65,000 volumes, the Blanchard Art Gallery, and extensive botanical gardens. It has several hospitals, homes for the friendless, and orphanages. Some of its prominent buildings are a Government building, the county court-house, the city hall, cathedral, opera house. There are a number of buildings of historic interest, as General Frémont's headquarters, the Plaza Church, some of the adobe houses, homes of the first settlers. The mayor holds office for two years; he appoints five trustees for the library, and is ex-officio a member and chairman of several committees. The council has four commissioners who have charge of police, health, fire and park departments. The board of education consists of nine members chosen by popular election, one from each ward.

Los Angeles has a cosmopolitan population, drawn from every State in the Union, and from almost every country in the world. The people are intelligent, cultured and enterprising. There are numerous churches, several fine theatres, a first-class public library, and a number of clubs for men and women. According to the United States census, the city made the largest percentage of increase of population of any city in the United States during the decades 1880-1900. Los Angeles has for many months led all American cities in increase of postal receipts, of bank clearings, and of buildings erected. Pop. (1880) 11,183; (1890) 50,395; (1900) 102,479. In 1900 the foreign born population was 20,000.

HARRISON GRAY OTIS,
Editor of the Los Angeles 'Times.'

Lossing, lōs'ing, Benson John, American historian and engraver: b. Beekman, Dutchess County, N. Y., 12 Feb. 1813; d. near Dover Plains, N. J., 3 June 1891. In 1826 he was apprenticed to a watchmaker in Poughkeepsie and subsequently entered into partnership with his employer, but in 1835 relinquished the business, and became joint owner and editor of the 'Poughkeepsie Telegraph.' He soon after settled in New York as an engraver on wood, and at the same time edited and illustrated the 'Family Magazine.' His connection with his newspaper enterprises in Poughkeepsie, however, continued until 1841. That year appeared his 'Outline History of the Fine Arts,' followed in 1847 by an illustrated work, 'Seventeen Hundred and Seventy-Six,' and in 1848 by 'Lives of the Signers of the Declaration of Independence.' His 'Pictorial Field Book of the Revolution' was issued in numbers in 1850-2, with more than 1,000 illustrations by himself. In the preparation of this work, which is remarkable for the minute and accurate information which it conveys, the author traveled at different times upward of 9,000 miles, visiting

every important battlefield of the Revolution, and making sketches on the spot. Among other works are: 'Illustrated History of the United States for Schools and Families' (1854); 'Our Countrymen, or Brief Memoirs of Eminent Americans' (1855); 'Primary History of the United States' (1857); 'Mount Vernon and its Associations,' illustrated by himself (1859); 'Life and Times of Philip Schuyler' (1860); 'Life of Washington' (3 vols.) (1860); 'Lives of the Presidents'; 'Pictorial Field Book of the War of 1812' (1868); 'The Civil War in America' (1866-8); 'The American Centenary' (1875); 'Cyclopedia of United States History' (1881); 'Compendious History of the Commonwealth of New York' (1887).

Lost Cause, The, a phrase which first became current as the title of a history of the Civil War (1886) by E. A. Pollard. It is used as an expressive designation for the purposes and aims which the Southern people, through the war, vainly sought to realize in the permanent establishment of the Confederate States of America.

Lost Chord, The, title of poem written by Adelaide A. Procter. It was first printed in 'Household Words,' and appeared again in her collection of 'Legends and Lyrics' (1858). The verses were set to music by Sir Arthur Sullivan, whose spirit was so attuned to that of the poet that words and music, both sounding a strain of grandeur, intellectual and emotional, may be regarded as mutually interpretative.

Lost or Hidden Island, an appellation anciently applied to Cephalonia, early navigators often being unable to find it on account of its diminutive size. The name also has been given to islands in different parts of the world that once discovered have disappeared or have not been found again.

Lost Pleiad, plē'ād, a star of the Pleiades constellation which tradition says was once visible, being the seventh of that cluster. Only six stars are now to be seen with the naked eye. Probably the origin of the story is less astronomical than mythological. The legend figures in poetry and in art, a poem by Letitia Landon and a painting by Thomas Buchanan Read each bearing the title.

Lost Property, strays and waifs excepted, may be retained by the finder with impunity, after proper means have been taken to advertise it; and if it cannot be conveniently preserved without hazard he may dispose of it if not claimed. If, however, the loser can identify his property he has a right to restitution, and a third party purchasing lost property from the finder must restore it to the owner, if called upon, and may proceed against the seller for satisfaction. The owner of lost movables must not only prove that they once belonged to him, but that he lost possession either by the fraud of some other party, or in such a way that the ownership still remained with him. The finder's "special property" in his find makes his title good against all save the real owner; the most striking exception is in the case of treasure-trove, that is, hidden valuables, of which, in England, a share goes to the crown, to which notice of such finding must be made. In the United States the law is less clear as to treas-

ure-trove; but it is distinguished from other found property in that the finder has not so good a title as the owner of land in which valuables are found, whereas the finder's title to property found in dwellings, and especially in stores and other semi-public places, is better than that of the owner of the premises. A derelict (q.v.) is distinguished from lost property in that it passes from possession of the owner with his knowledge and consent. Lost property at sea is governed by peculiar principles. The limitation is one year, within which time the possessor may recover property upon the payment of expenses of the finder and of the remarkably heavy percentage of its value called salvage. There are certain cases in which a jury will construe the retention of lost property into larceny. If the finder knows the owner, or can readily discover him, the taking with the intent to keep will amount to larceny. But the more common ground for action in America is detinue, that is, the unlawful retention of property. Obviously there is no recourse if the property detained be of such a character that it cannot be identified.

Lost River, a short stream in the north-western part of West Virginia, which disappears from view in one part of its course. It passes for some distance along underground channels but reappears again.

Lot, according to the book of Genesis, the son of Haran, and the nephew of Abraham. In order to avoid dissensions between his followers and those of Abraham, he went east into the plain of Jordan, toward Sodom, while his uncle dwelt in Canaan. Having been taken captive by some marauders (styled kings in Gen. xiv.), Lot was delivered by Abraham. Having received two angels into his house in Sodom, an attack was made upon it by the inhabitants, who were struck blind, and the impending destruction of the city was announced to Lot. He escaped with his family; but his wife, looking back "became a pillar of salt." The name "Lot's wife" is still given to a detached pillar about 40 feet high, on the Jebel Usdüm, a height near the Dead Sea.

Lot (ancient *Loda* or *Olitis*), France, one of the largest tributaries of the Garonne River, rises at Mount Lozère, one of the Cevennes, near Mende, department of Lozère. It flows west by south across the departments of Lozère, Aveyron, and Lot, and joins the Garonne at Aiguillon, in the department of Lot-et-Garonne. Total course about 250 miles, of which 180 miles, commencing at Entraigues, are navigable.

Lothair (lō-thār') I., Roman emperor, eldest son of Louis-le-Debonnaire: b. about 795; d. Prüm, Prussia, 29 Sept. 855. He became associated with his father in the government of the empire in 817 and was crowned and named King of the Lombards in 820. On his father's death Louis and Charles, his brothers, joined their forces and defeated him at Fontenay in June 841. In 843 the three brothers concluded the noted treaty of Verdun, by which Lothair retained the title of emperor, with Italy, and some French provinces beyond the Rhine and the Rhone. Charles then became king of France, and Louis received a tract of country bordering on the Rhine.

LOTHAIR—LOTTERY

Lothair II., called **THE SAXON**, Roman emperor: b. about 1060; d. near Trent 4 Dec. 1137. He became duke of Saxony in 1106 and was elected king of Germany in 1125 and crowned by Pope Innocent II. in 1133.

Lothair, a novel by Benjamin Disraeli, published in 1870. The scene of this extravagant, but remarkable, story is laid chiefly in England about the period of its publication. The hero, Lothair, a young nobleman of wide estates and great wealth, has been surrounded by a Protestant atmosphere. When, in accordance with his father's will, he goes to Oxford to complete his education, his other guardian, Cardinal Grandison, determines to bring him into the Roman Church. The story is a graphic description of the struggles of rival ecclesiastics, statesmen, and leaders of society to secure the adherence of the young nobleman.

Lo'thop, Amy. See **WARNER, ANNA BARTLETT.**

Lothrop, Harriet Mulford Stone, "**MARGARET SIDNEY**," American writer for young people: b. New Haven, Conn., 4 Oct. 1844. She was married to the Boston publisher, D. Lothrop, in 1881, and was founder and president of the National Society of the Children of the American Revolution. Among her numerous publications, mainly for young people, may be cited: 'The Five Little Peppers' series (1882-1903); 'So As by Fire' (1881); 'The Pettibone Name' (1883); 'The Golden West' (1885); 'The Minute-Man' (1886); 'Dilly and the Captain' (1887); 'Little Maid of Concord Town' (1898); 'The Judge's Cave: a Romance of the Days of Regicides'; etc.

Loti, Pierre, pê-âr lô-tê. See **VIAUD, LOUIS MARIE JULIEN.**

Lo'tion, a wash, solution, or medicinal mixture for external application to the body; usually a liquid remedy, consisting principally of water, as a menstruum, and applied to circumscribed portions of the skin, or of the mucous surfaces. Lotions are either cooling, stimulating, astringent, soothing, or sedative. Water combined with spirit or vinegar is an example of the first. The spirit is added to the water in the proportion of half an ounce and upward to the half-pint. The lead lotion is at once cooling and astringent. A good stimulating lotion is procured from a mixture of water with a third or a half of its bulk of spirit of wine, which is applied to the skin by means of lint, and covered to prevent evaporation. Astringent lotions are formed by adding from 1 to 10 grains of sulphate of zinc or of white vitriol to an ounce of very cold water, having other astringents in solution. Soothing lotions consist of the various preparations of opium, of the decoction of poppies, hemlock, etc., and prussic acid is employed in the preparation of sedative lotions. Stimulating lotions are applied to indolent ulcers and tumors, and sedative and narcotic mixtures are employed to alleviate pain.

Lotophagi, lô-tôf'a-jî. See **LOTUS-EATERS.**

Lo'ta. See **CRABTREE, CHARLOTTE.**

Lotter (lôt'tèr) Family, a family of printers in Germany, the founder of which, Melchior Lotter, born at Aue, appeared in Leipsic about 1491. There his publications of brevi-

aries and missals brought him reputation, which his larger enterprises extended. He published: 'Persius' (1512); 'Horatii Epistolæ' (1522); 'Lutheri Tessaradecos Consolatoria pro Laborantibus' (1520); etc. One of his innovations was the reservation of Gothic types for German and use of Roman for Latin. He is supposed to have given at least secret sympathy and aid to the Reformation. His son, Melchior, who died about 1540, was the original printer of Luther's Bible (1522-4), and was succeeded by Hans Lufft (q.v.). His publications also included various works of Luther, Melanchthon, and other writers.

Lot'tery, a public gambling scheme, by which, for a valuable consideration, one may by favor of the lot obtain a prize of a value superior to the amount or value of that which he risks. In its best and most frequent application, the word describes those schemes of this nature which are conducted under the supervision and guaranty of government, and the proceeds of which are devoted to public objects. Almost all modern states have, at some period of their history, employed lotteries as a means of revenue. But though they supply a ready mode of replenishing the public treasury, they have always been found to exert a mischievous influence upon the people. The poor are invited by them rather than the rich. They are diverted from persistent labor and patient thrift, by the hope of sudden and splendid gains; and as it is the professed principle of these schemes to withhold a large part of their receipts, a necessary loss falls upon a class which of all in the community can least afford to bear it. Between the years 1816 and 1828 the French government derived from lotteries an annual income of \$2,400,000. Some years later the government suppressed them, and in January of the next year \$110,000 more were found to be in the savings banks of Paris alone than in the same month of the preceding year. In several European states government lotteries are still maintained. They have become an almost indispensable source of revenue; and they are defended by the argument that as the passion for play is irrepressible among the people, and their money would otherwise be invested in foreign or in secret and less fairly managed schemes, the state may well assume the conduct of lotteries at home; that under its supervision the evils attendant upon them are diminished, and their earnings are devoted to the public welfare. There were lotteries in ancient Rome and in England as early as 1659.

In the United States, the lottery has been from the earliest settlement of the country a familiar means of raising funds, which in this country could have been secured in no other mode so easily if at all. The Virginia company derived a large profit from English lotteries, and the influence of them extended gradually to the eastern colonies; for it is reported that an assembly of ministers at Boston in 1699 denounced the lottery as "a cheat," and its agents as "pillagers of the people." Generally, however, lotteries enjoyed a fair reputation, and certainly were soon extensively employed throughout the country. In the 18th century they were extraordinarily popular in America. Legislatures authorized lotteries for every species of public improvement, for the building of

churches and colleges, for the repair of losses to individuals by fire and otherwise; for example, Faneuil Hall, after the fire of 1761, was rebuilt by lottery. The Continental Congress tried to raise money by lottery in 1777.

In 1833 a society was formed in Pennsylvania which advocated their suppression. In July 1834 the society issued an address to the public, setting forth its objects and views. It is to the efforts of this society that we should mainly attribute the action of most of the States in prohibiting the further establishment of lotteries. Where they are not especially authorized (and in some States the constitution expressly forbids the legislature to authorize them), the parties concerned in them are, in nearly all the States, subject to the imposition of heavy penalties. There exist in the State reports many cases where the provisions of State statutes concerning lotteries have been construed by the courts, but these decisions are necessarily of a particular character, and no important general principles can be derived from them. In Tennessee and Virginia, the acts abolishing lotteries have been by express decisions pronounced constitutional. In Massachusetts, a clause in such an act authorizing a search for tickets provided for the purpose of drawing a lottery is not held to be inconsistent with that article of the bill of rights which declares that every subject has a right to be secure from all unreasonable searches and seizures of his house or person. In New York and Pennsylvania lotteries are declared to be public nuisances, and they may therefore be indicted as such. The schemes known as art unions are held to be lotteries by express decisions. In the language of the court in New York: "These associations distribute a small number of prizes among a great number of persons. The prizes and blanks are drawn in the same manner as in other lotteries. The intention of these schemes is to sell works of art for more than they can be sold for at private sale, and this is to be brought about by an appeal to the universal passion for playing at games of chance. They have all the attributes and elements of lotteries."

The sums annually employed by Americans in lottery speculations probably amounted to hundreds of thousands. The last lottery supported by governmental encouragement was the Louisiana State Lottery. An Act of Congress passed in 1890 attempted to crush it by forbidding it the use of the United States mails, which act compelled its removal to Honduras, where in 1903 it was still in existence, and thousands of tickets for this lottery were sold monthly in the United States, particularly on the Pacific Coast, where as late as November 1903 the daily newspapers issued "extras" giving the winning numbers in the drawings of the Honduras company.

Lot'to, a game having its origin in Italy but now played occasionally in other countries. It is played on boards, divided in 27 small squares, arranged in three horizontal rows; five squares in each row are marked with numbers between 1 and 90, four of the squares being left blank. Each person playing is provided with a board upon which he covers the space marked with the particular number called out by the dealer, who draws the counters from a bag. The player who first covers all the five numbers on any horizontal row is declared the winner.

Lo'tus, a popular name for a large number of unrelated plants, and also a generic name for certain plants of the natural order *Leguminosæ*. The genus contains between 50 and 100 species of herbs or sub-shrubs common in the temperate zones. They have trifoliate leaves; pea-shaped, yellow, red, or white flowers, generally in axillary umbels; and linear or oblong pods. The best known species are probably *L. corniculatus* and *L. tetragonolobus*, the former popularly known as bird-foot trefoil and babies' slippers, the latter as winged pea. The former is a perennial often planted in dry soils for ornament and for forage; the latter, an annual whose young pods are eaten like string-beans, and the ripe seeds used as a substitute for coffee.

As a popular name, lotus is applied to various water-lilies, especially to certain African and Asiatic kinds, which were held to be sacred to national deities, and were also symbolical of the world, the residence of the gods and of beauty. The fruits of several plants known by this common name have been used for food; for instance, *Zizyphus lotus*, a close relative of but inferior to the jujube (q.v.), *Celtis australis*, the hackberry, *Nitraria tridentata*, *Rhamnus lotus*, and *Nelumbo lutea*, an American plant also known as water chinquapin and yellow water-lily.

The date, plum or persimmon is sometimes called lotus from the specific name of one of its species, *Diospyros lotus*, which by some writers is supposed to be the plant whose fruit was eaten by the fabled lotus-eaters, and whose juice made into wine caused these people to forget their native land. In this connection other plants have been similarly designated; for instance the blackberry and *Zizyphus lotus* mentioned above.

Lotus-eaters (Latin *Lotophagi*), in ancient Greek legends a people on the north coast of Africa who lived on the fruit of the lotus-tree. According to Homer they received Ulysses and his followers hospitably, but the sweetness of the fruit induced such a feeling of happy languor that they forgot their native land and ceased to desire to return to it, their sole object being to live in delicious dreamy idleness in Lotusland. See *Lotus*.

Lotze, Rudolph Hermann, German philosopher and physiologist: b. Bautzen, Saxony, 21 May 1817; d. Berlin 1 July 1881. He studied philosophy and medicine at Leipzig and in 1842 was appointed extraordinary professor of philosophy in that University, and in 1844 ordinary professor in Göttingen. In 1881 he filled the same chair in Berlin. His philosophical position is that of a teleological idealist, and he makes metaphysics to be destitute of all independent existence, apart from ethics. The Universe has its cause in the notion of the Good, which underlies all the phenomena and activities of the world. His position as a teleologist is the same as that of Asa Gray, and while allowing that mechanism obtains in the movements of the universe he denies that this excludes the possibility of creative design. Lotze is, however, considered to have done his most original work in the domain of psychology. He teaches that our space-consciousness is built out of the distinctive, non-spatial sense-attributes, which vary according to the locality of the sense-organs stimulated. Among his works are: 'Metaphysik' (1841); 'Logik' (1843); 'Mikrokos-

mus' (1856-64); and 'Geschichte der Aesthetik in Deutschland' (1868).

Loubat, Joseph Florimond, zhō-zēf flō-rī-mōnd loo-bā, Duc de, French author and philanthropist: b. New York 21 Jan. 1831. He was graduated from the University of Paris and has been a liberal giver to public institutions, among his benefactions of this character being a gift of \$1,000,000 to Columbia University, including valuable books and MSS. He has likewise given much to the Roman Catholic Church, and in recognition of this fact received his title of Duc de Loubat from Pope Leo XIII. in 1893. He has written: 'Narrative of the Mission to Russia in 1866 by G. V. Fox'; 'Medallic History of the United States.'

Loubet, Emile, ā-mēl loo-bā, French statesman: b. Marsanne (Drôme) 1838. He was graduated in law at Paris, in 1865 was admitted to the bar at Montélimar, attracted attention by his legal ability, became counsel for the Paris, Lyons, and Mediterranean railway, in 1869 was elected conseiller d'arrondissement, and 4 Sept. 1870 was chosen mayor of Montélimar. Elected in 1871 to the general council of the Drôme, of which he afterward (1885) became president, he was returned to the Chamber of Deputies for Montélimar in 1876, where he served with the Republican left until 1885. In 1885 he entered the Senate for the department of the Drôme, and from December 1887 until April 1888, when he retired with his colleagues of the ministry, filled with much credit the post of minister of public works in the Tirard cabinet. He was chairman of the finance committee of the Senate in 1890, chairman of the customs committee in 1893; and on 29 Feb. 1892 was made premier by President Carnot. His cabinet, in which he held the portfolio of the interior, lasted until November of that year, when its retirement was caused by attacks on its supposed laxity in the prosecution of the Panama case. In 1896 he was chosen president of the Senate. Upon the sudden death of President Faure (16 Feb. 1899), the National Assembly met in congress (18 February) and elected Loubet president of the Republic on the first ballot. His position in politics is that of a moderate Republican, without the tendency to Radical views sometimes ascribed to him. He has been not only a skilful administrator, but a close student of economic questions. He is a protectionist, though not of the extreme type, and an advocate of economy in finance, having made an able speech on financial reform in 1895. His administration as president has done much to strengthen the Republicans, and the Monarchist party has almost entirely disappeared as a serious factor in national affairs. Among the events of his term were the trial of Captain Dreyfus at Rennes, the strike of the miners at Montceau and of the dock-workers at Marseilles, and the enforcement of the association's law, with the attendant disturbances. In 1906 he was succeeded in the Presidency by Clément Armand Fallières (q.v.). See FRANCE, *History*.

Loudon, low'dōn, **Fort**, a name given to two forts built during the Colonial period, and intended for defense against the Indians. One built in 1750, was in Loudon County, Tenn., on the Tennessee River. An Indian massacre took place here a few years after the erection of the

fort. The other Fort Loudon was erected in 1752, near Winchester, Va. It was a square building with four bastions, mounting 24 guns. It was large enough to accommodate nearly 500 men.

Loughead, lō'hēd, Flora Haines, American novelist and journalist: b. Milwaukee, Wis., 12 July 1855. She was graduated from Lincoln University, and was married in 1875 to C. E. Appony, and in 1886 to John Loughead, a journalist. She has done much journalistic work in Chicago, Denver and San Francisco, and is the author of 'The Libraries of California' (1878); 'The Man Who Was Guilty' (1886); 'Handbook of Natural Science' (1886); 'Quick Cooking' (1890); 'The Abandoned Claim' (1890); 'The Man from Nowhere' (1892); 'Santos's Brother' (1892); 'A Crown of Thorns' (1892); 'The Black Curtain' (1897); 'The San Franciscan'; and of several plays.

Louis, loo'is (Fr. loo-ē), called 'THE CHILD,' king of Germany: b. 893; d. 911. He was the son of the Emperor Arnulphus, and succeeded him in 899. During his nominal kingship the government was mainly conducted by Archbishop Hatto of Mainz. At this time the empire was constantly ravaged by the Hungarians. He was the last prince in Germany of the Carolingian race.

Louis I., surnamed LE DEBONNAIRE, Roman emperor: b. 778; d. near Mainz, Germany, 20 June 840. He was a son of Charlemagne, was early appointed by his father King of Aquitania, and in 813 was named joint-regent of France, of which, in the following year, he became sole sovereign, as well as Emperor of the West. In 817 he divided his dominions among his three sons, and thereby gave rise to disturbances and contests which lasted during the whole period of his reign. In 829, in consequence of the solicitations of his second wife, Judith of Bavaria, who had borne him a son, Charles the Bald, he made a new division of the empire. In 830 the brothers Lothair and Pepin combined against their father, took him prisoner, charged their stepmother with adultery, and shut her up in a monastery. The design of Lothair to make himself sole sovereign having been discovered, the diet of Nimeguen obliged him to submit at discretion. Strife continued for the rest of Louis' life. In 837 Louis made a new division in favor of Charles, who obtained Neustria in addition to Aquitania. Though not without good qualities Louis had neither the statesmanship nor decision necessary for ruling so large an empire. He was succeeded as emperor by Lothair, to whose protection he had recommended his favorite son Charles.

Louis II., Roman emperor: b. about 822; d. Brescia 13 Aug. 875. He was the son of Lothair I., was made king of the Lombards in 844, and became emperor, in succession to his father, in 855.

Louis III., Roman emperor: b. about 880; d. about 924. He was the son of Boson, king of Provence, and Ermengarde, daughter of the Emperor Louis II. He succeeded his father on the throne of Provence at the age of 10, and in 900 contested the imperial throne with Berengar I., who, having surprised him at Verona, deprived him of his sight.

Louis IV., surnamed the **BAVARIAN**, Roman emperor: b. 1286; d. near Munich 11 Oct. 1347. He was the son of Louis the Severe, Duke of Bavaria, and succeeded his father in the dukedom, and was elected emperor in 1314. Frederick le Bel of Austria was also chosen at Cologne by another party of electors, and a war between the rivals ensued. Frederick was taken prisoner and only gained his liberty by renouncing his claims. Pope John XXII. then, in 1322, issued his bull of deposition against Louis, and the latter, appealing to a general council, went to Italy, where he declared the deposition of John and set up Peter de Corbiere as pope under the name of Nicholas V., by whom he was crowned at Rome. In 1328 the German electoral princes in a council at Rhense announced that the emperor's title to the German and imperial crowns were derived from his election by them and required no further sanction from the pope, the validity of which proceeding was not recognized by the Papacy.

Louis I., king of France. See **LOUIS I.**, Roman emperor.

Louis II., surnamed **LE BÈGUE** (the Stammerer), king of France: b. 846; d. Compiègne, France, 10 April 879. He was the son of Charles the Bald, was crowned King of Aquitaine in 867, and succeeded his father on the throne of France in 877. He was obliged to deliver up Provence to Boson, by whom it was erected into a kingdom. His children, Louis and Carloman, divided the kingdom between themselves and a posthumous son, afterward known as Charles the Simple.

Louis III., king of France: b. about 863; d. 822. He was the son of Louis II., and the brother of Carloman, with whom he divided the rule of the kingdom. He defeated Hugh the Bastard, son of Lothaire, marched against Boson, king of Provence, and successfully opposed the Normans at Saucourt, a battle recounted in the famous German poem, the 'Ludwigslied.'

Louis IV., surnamed **D'OUTREMER**, king of France: b. 921; d. September 954. He was the son of Charles the Simple and became king in 936, on the death of Rudolph of Burgundy. He invaded Normandy, but was defeated and taken prisoner in 944. He was set free the next year after being obliged to concede Normandy to Richard, son of Duke William, and Laon to Hugh, father of Hugh Capet.

Louis V., surnamed **LE FAINÉANT** (Do Nothing), king of France: b. 966; d. May 987. He was the last French monarch of the Carolingian dynasty. In spite of the name conferred upon him he was an active ruler. He succeeded his father Lothaire in 986, and soon after becoming king took the city of Rheims and was preparing to march to the assistance of the Count of Barcelona, hard pressed by the Saracens, when he is said to have been poisoned by his queen.

Louis VI., surnamed **LE GROS** (the Fat), king of France: b. about 1078; d. 1 Aug. 1137. He was the son of Philip I., with whom he was associated in the government in 1100, and whom he succeeded in 1108. His reign was greatly disturbed by contests with the Normans, and by feuds among his vassals. He quarreled with Henry I. of England, and thus was begun the struggle between the English and the French,

which continued three centuries. He was ably counseled by his minister, Abbé Suger. Consult: Luchaire, 'Louis VI. le Gros' (1889).

Louis VII., called **LE JEUNE**, king of France: b. about 1120; d. 18 Sept. 1180. He was the son of Louis VI., and succeeded him in 1137. He contested with Pope Innocent II. the right of presentation to benefices, and was excommunicated by Innocent and his kingdom placed under interdict. By the persuasions of St. Bernard, Louis embarked on the Second Crusade, but was defeated by Saladin, and while returning to Europe, was captured at sea by the Greeks, but afterward rescued by Roger, king of Sicily. His divorced queen, Eleanor of Aquitaine, married Henry of Normandy, afterward Henry II. of England, bringing with her as dowry the provinces of Poitou and Guienne. This caused a long war between England and France. Consult: Luchaire, 'Études sur les Actes de Louis VII.' (1885); Hirsch, 'Studien zur Geschichte König Ludwigs VII. von Frankreich' (1892).

Louis VIII., surnamed **THE LION**, king of France: b. 1187; d. Montpensier, Auvergne, France, 8 Nov. 1226. He was the son of Philip Augustus of France and married Blanche of Castile in 1200. Accepting the offer of the English crown made him by the English barons in 1216 he landed in England, took Rochester and Winchester and received the homage of the barons at London. On the death of John he was excommunicated by the legate and withdrew to France in September 1217. He succeeded his father in 1223, and soon regained most of the English possessions in France. In 1226 he led a crusade against Raymond, Count of Toulouse, and the Albigenses; took Avignon after a three months' siege, and laid waste Languedoc. Consult: Petit Dulailis, 'Étude sur la Vie et la Regne de Louis VIII.' (1894).

Louis IX., called **SAINT LOUIS**, king of France: b. Poissy, France, 25 April 1214; d. near Tunis, Africa, 25 Aug. 1270. He was the son of Louis VIII. and Blanche of Castile and came to the throne on the death of his father. Being only in his 12th year he was placed under the guardianship of his mother, who was made regent of the kingdom, and was declared of age in 1236. In 1243 Louis defeated the English in several engagements, and a truce for five years was concluded. Having made a vow, in the event of recovering from a dangerous disease, to march against the infidels in the Holy Land, he in 1248 embarked at Aigues-Mortes with an army of 50,000 men. This expedition proved disastrous and Louis with his army was captured by the Saracens. Damietta, which had been taken by the French, was demanded as the price of the monarch's freedom, and a vast ransom was also claimed for his followers. In 1254 he returned home, and in the interval Queen Blanche, who had ruled the kingdom well in his absence, had died. Louis now turned his attention to the administration of the law. The subjects were now suffered to appeal from the decision of their lords to four royal tribunals, and men of learning were introduced into the parliament. Louis also diminished the taxes. The code of laws known as the 'Établissements de St. Louis' is the work of some unknown compiler. In 1270 he undertook a crusade against Tunis, in the midst of which

LOUIS

enterprise he died. He was canonized by Boniface VIII. in 1297, and the Sieur de Joinville wrote his life. Consult: Langlois, 'Saint Louis' (1887); Berger, 'Saint Louis et Innocent IV.' (1893); Lecoy de la Marche, 'La France sous Saint Louis' (1893); Berger, 'Histoire de Blanche de Castile' (1895); Sepet, 'Life' (1903).

Louis X., surnamed **LE HUTIN** (the Quarrel), king of France: b. Paris 1289; d. Vincennes 4 June 1316. Through his mother he inherited the kingdom of Navarre in 1305, and in 1314 he succeeded Philip the Fair, his father, on the throne of France. His posthumous son, John I., survived but a few months, and Louis' brother then succeeded as Philip V.

Louis XI., king of France: b. Bourges, France, 3 July 1425; d. Plessis-les-Tours, France, 30 Aug. 1483. He was the son of Charles VII., but in all respects very unlike him, and in 1440 he left the court and headed an insurrection against his father. Charles pardoned his son but the latter soon entering into new conspiracies was obliged to take refuge in Burgundy, and lived there five years in a dependent condition. On reaching the throne after the death of his father, in 1461, he dismissed the former ministers and surrounded himself with obscure men, having neither character nor talents to recommend them. In all his acts a crooked policy and sinister views were evident. Pretending to reconcile contending parties, he secretly instigated them against each other, and when negotiating with a foreign government he bribed its messengers and established secret correspondences with them. He carried on a war with Charles the Bold, Duke of Burgundy, which lasted 1465-72, and on the death of Charles in 1477 at the battle of Nancy, he joined Burgundy to France. In 1481 he united Anjou, Maine and Provence to the kingdom. Consult: See, 'Louis XI. et les Villes' (1893); Kitchin, 'History of France,' Vol. I. (1885).

Louis XII., surnamed the **FATHER OF HIS PEOPLE**, king of France: b. Blois, France, 27 June 1462; d. 1 Jan. 1515. He was the son of Charles, Duke of Orleans, and on coming to the throne in 1498 he pardoned all who had wronged him previously. His reign was continually disturbed by war. He subdued the Milanese, Genoa, and Naples; but in 1513 the French were expelled from Italy. Henry VIII. of England, attacking Louis in his own dominion, Louis was obliged to sue for peace after the Battle of the Spurs in August 1513. For his third wife he married the young Princess Mary, sister of Henry VIII., who after his death was married to her first lover, Charles Brandon, Duke of Suffolk. Louis XII. was honest and magnanimous; he was friendly to science, and France prospered under him. Consult: Lacroix, 'Louis XII. et Anne de Bretagne' (1882); Claviere, 'Histoire de Louis XII.' (1890 et seq.).

Louis XIII., king of France: b. Fontainebleau, France, 27 Sept. 1601; d. Saint Germain-en-Laye, France, 14 May 1642. He was the son of Henry IV., whom he succeeded under the regency of his mother, Mary de Medicis. In 1614 he was declared of age and the next year he married Anne of Austria. The realm was now in a very disturbed state. The Huguenots were threatening and a great part of the kingdom rebelled. In 1624 Louis chose Cardinal

Richelieu as his prime minister, and the remainder of his reign was to all purposes that of the great cardinal. Under him the Huguenot power was broken, politically, the governmental power centralized and the influence of Austria materially weakened. Consult: Raumer, 'Geschichte Ludwigs XIII. und des Kardinals Richelieu' (1830); Topin, 'Louis XIII. et Richelieu' (1876); Zeller, 'La Minorité de Louis XIII.' (1897). See **RICHELIEU**.

Louis XIV., king of France: b. Saint Germain-en-Laye 5 Sept. 1638; d. Versailles 1 Sept. 1715. He was only 5 years old when he succeeded to the throne, but his mother, Anne of Austria, was made regent during his nonage which ended in 1651, when he was 13. Cardinal Mazarin was then prime minister and the French army under the leadership of Condé and Turenne was gaining much glory in the war with Spain and the emperor. But internally the nation was in the throes of a civil war; Mazarin's avarice and the peculations of Fouquet had disgusted the Parisians, who were moreover incensed with Anne of Austria's conduct of the regency and the supremacy of her agent the cardinal. The king and his mother were compelled with the unpopular prime minister to flee from the capital, and the Spanish armies streamed over the northeast boundaries from Holland and held their way victoriously through Champagne and Lorraine. When war broke out between England and Holland Louis threw his strength on the side of the latter; but the conflict was largely confined to the sea, and after a few sea fights the war was ended by the Peace of Breda in 1667. Mazarin had died in 1661, Fouquet was condemned to perpetual imprisonment after being compelled to disgorge his ill-gotten gain, and when the king was asked who was to be referred to on matters of public business he astonished his courtiers by saying "Myself." And indeed he reigned as absolute monarch to the end of his days. He appointed Colbert to take charge of the public exchequer, and the consequence was a multitude of needed reforms. He had forced the court of Spain as well as Pope Alexander VII. to submit to his personal dictation and make ample reparation for the wrongs suffered by French ambassadors at the hands of Spaniards and Italians in foreign capitals. All Europe was impressed by his bold self-assertion, and his well-known saying "*L'état c'est moi*," "I am the state," was felt to be literally true. But his great desire was the attainment of military glory. When a child his chief amusement had been to turn his playmates into soldiers and engage in a mimic war. After his victorious campaign in Holland, closed by the Treaty of Nimeguen in 1678, he was acknowledged to be the leading sovereign in Europe. He had the most numerous, the best drilled, the best equipped army in the world. His diplomacy had triumphed in every court, and the French nation led Europe in art, science and letters, while trade and industry were amazingly flourishing. Louis shone among his ministers, generals and literary courtiers as the sun among the stars, an ideal king, a paragon of learning, strength and wisdom. At Versailles he built himself a palace at a cost of 150,000,000 francs. Here the splendor of his surroundings was the envy and admiration of all other monarchs, great and small. But his wisdom and political sagacity were much criti-

cised when in 1685 he revoked the Edict of Nantes by which the policy of Henry IV. had made certain indulgences to Calvinists of France. By unsheathing the sword of religious persecution he drove away many citizens whose industrial skill and steady lives formed one of the stables and most precious elements in French national life. Soon after this half of Europe formed a league against France. Holland, Germany and Spain joined their forces in an attempt to humble the overweening arrogance of a monarchy whose greatness was a menace to each of them. In 1688 the dauphin took Philippsburg on the Rhine, but was forced to evacuate and retreat before the overwhelming forces of the allies. The war continued with varied fortunes until the peace of Ryswick, 1697. The death of Charles II. of Spain, the last of the house of Hapsburg (1700), brought on the war of the Spanish Succession. He left his crown to Philip of France, Duke of Anjou, who assumed the title of Philip V., but his claim was disputed by the Archduke Charles, who had the support of the emperor, as well as of Holland and England. In 1704 Prince Eugene and Marlborough routed the French forces at Blenheim, Barcelona surrendered to the Archduke Charles, Marlborough won the battle of Ramillies and in 1708 that of Oudenarde. The fatal defeat of Malplaquet the following year decided the struggle in favor of the allies and the Peace of Utrecht (1713) completed the humiliation of France and added to the power and ascendancy of England. France was, however, saved from dismemberment, mainly through the boldness and vigor of Louis and his counsellors, and the principal foreign conquests of the king were not forfeited. For the two remaining years of his reign the country enjoyed tranquillity. Louis in his declining years expressed regret for the distress he had brought on his well-loved country by his love of foreign conquest and warlike glory. His unworthy private life had some part in rousing the remorse which tortured his last days, and caused him to show that spirit of piety and devotion which Lesage ridiculed as hypocrisy. His mistresses, La Vallière, Montespan, Fontanges, and others had made his court a by-word of scandal. Madame de Maintenon, who was married to him a year after the death of his queen Maria Theresa (1683), was influential in rousing his sense of past licentiousness. In this she was aided by the eloquence of Bossuet.

The reign of Louis le Grand was made brilliant by the great soldiers, sailors, literary men, artists, and men of science who were his contemporaries. His reign has indeed been aptly styled the Augustan or golden age of France. Among his sea commanders were Château-Renard, Duquesne, and Tourville; Vauban was his military engineer; Perault, Mansart and Blondel architects; among his painters were Claude Lorraine, Poussin and Lebrun; among poets and writers of his reign were Corneille, Racine, Molière, among his great preachers were Massillon, Bossuet and Flechier. He was worthy of the title of the Great Monarch for his strong and astute statescraft, the magnificence of his court, his dignity and munificence, and he fixed for the French monarchy that type of absolutism which Balzac has declared to be in France the safest and best foundation on which national greatness was to be developed.

Consult: Voltaire, 'Siècle de Louis XIV.'; Hassall, 'Louis XIV. and the Zenith of the French Monarchy' (1895); and Philippon, 'Das Zeitalter Ludwigs des Vierzehnten' (1879).

Louis XV., king of France: b. Versailles, France, 15 Feb. 1710; d. there 10 May 1774. He was the great-grandson and successor of Louis XIV., and coming to the throne when only five years old, Philip, Duke of Orleans, was made regent. Louis was declared of age in 1723 and married Marie Lezinska, daughter of the king of Poland. The Duke of Orleans died that year and was succeeded as prime minister by the Duke of Bourbon, who was removed in 1725 to make way for Cardinal Fleury, who died in 1743. After the Cardinal's death the king's mistresses, Pompadour and Du Barry, controlled the election of the prime minister and other officers. In 1741 France became entangled in the war of the Austrian Succession against Austria but in 1756 was involved in the Seven Years' war, in which Austria was the ally of France. This was ended by the Peace of Paris in 1763. By this treaty Louisiana and Canada were lost to France. The kingdom was left impoverished at the death of Louis, partly by war and partly through the enormous sums squandered upon the royal mistresses. Consult: De Tocqueville, 'Histoire philosophique du Regne de Louis XV.' (1846).

Louis XVI., king of France: b. Versailles 23 Aug. 1754; d. Paris 21 June 1793. He was the third son of Louis and of Marie Josepha, daughter of Frederic Augustus, king of Poland and elector of Saxony. During the lifetime of Louis XV. he bore the title of Duke of Berri. Amid the corruptions of the French court he kept aloof from licentiousness, was reserved and taciturn, and took most delight in practising some mechanical art, such as lock-making or printing. In 1770 he was married to Marie Antoinette, archduchess of Austria, and four years later became a king by the death of his grandfather. He began his reign with many popular measures tending to alleviate the financial distress under which the country labored, and his appointment of Turgot as minister of finance gave general satisfaction. The people were moreover pleased to see the parliaments again convened (1774), and the king set an example of national economy and retrenchment by the simplicity of his personal life, and the reduction of his retinue. The war of the American Revolution had sent Franklin and Deane to Paris to ask help for the young republic. Louis XVI. was weak enough to take sides with the English colonists against their mother country, and the French and English war cost France an amount of treasure that almost plunged her into bankruptcy. At the same time French enthusiasm, roused in favor of republicanism, caused a feeling to prevail which threatened to endanger the stability of the monarchy. Necker by his attempts at reform and economy so offended the nobility that he was compelled to resign and was succeeded by the reckless and wasteful Calonne. The queen was meanwhile very unpopular, and the affair of the "Diamond Necklace" (q.v.) was made to aggravate public disaffection toward the throne. The notables met in 1787, but rejected a measure for universal taxation which would comprise the notables and clergy of the realm. Calonne, the finance minister, resigned, bankruptcy menaced the nation and Necker was

recalled, and suggested the convening of the States-General. The assembly met amid great popular excitement in May, 1789, at Versailles, a series of reforms in public expenditure was begun, and the country was filled with enthusiasm. Necker sought to reproduce on French soil the limited monarchy of Great Britain. Louis proposed concessions, which were coldly greeted, and when he dissolved the assembly, Mirabeau, who sat in the third estate, defied the royal power, and refused, in the name of the people, to obey the mandate of dissolution. So great meanwhile was the excitement and anxiety which reigned in Paris that a national guard was formed with Lafayette for a commander. The king vacillated, dismissed Necker, surrounded Paris with his army and the people rose in a burst of frenzy and sacked the Bastille. The king ordered the approach of the troops on Paris, but to conciliate the people appeared at Hotel de Ville wearing the tricolor. Meanwhile the princes of the blood and the nobles were leaving the country, Necker was recalled, and the king returned to Versailles, but on 5 October the mob took possession of the royal palace there, and compelled the king and the royal family to return with them to Paris, where they were kept strictly guarded in the Tuileries. There they were confined as prisoners till the following year (1790). Necker had fled to Switzerland, Mirabeau, the one hope of the monarchy, had died. The king made an attempt to visit St. Cloud (1791) but was prevented by the mob. He then escaped unnoticed from the Tuileries, but was stopped at Varennes, 150 miles from Paris. The invasion of France by the Prussians and Austrians roused the Parisians to fury. They stormed the Tuileries and massacred the Swiss guard; the royal family were flung into the ancient fortress known as the Temple. The national convention met on 20 September; in December they brought the king to trial on a charge of conspiring to overthrow the constitution and restore the ancient order of things. He was condemned by unanimous vote 5 Jan. 1793 and was guillotined. Consult Bouvet, 'Histoire de Louis XVI.' (1825); Jobez, 'La France sous Louis XVI.' (1877-93); Beaucourt, 'Captivité et derniers Moments de Louis XVI.' (1892); Courian, 'Louis XVI. et la Révolution' (1893).

Louis XVII., titular king of France: b. Versailles 27 March 1785; d. Paris 8 June 1795. He was the second son of Louis XVI. and Marie Antoinette; was at first styled Duc de Normandie; and after the death of his elder brother, in 1789, became heir to the throne. With his relatives, in 1792, he was imprisoned in the Temple; after his father's death in the following year was styled king by the Royalists; but being given into the keeping of a shoemaker named Simon, in derision called his tutor, was subjected to brutal treatment, from which he died. The fact of his death was denied by certain impostors, whose claims to his name and to the throne found some supporters. Such claims continued to be urged almost down to the middle of the 19th century, about which time Eleazar Williams (q.v.) a half-breed Indian missionary, born in the State of New York, was led to believe that he was the lost dauphin, he and his friends declaring that he had been delivered from prison and while still very young brought to this country. He died in 1858. Although Williams made lit-

tle attempt to enforce his own claim, others argued it, and a book was written in its support. But nothing in the nature of historical proof has been established to cast doubt on the actual death of the dauphin as above related. Consult: Hanson, 'The Lost Prince' (1854); Bülow, 'Geheime Geschichten und rätselhafte Menschen,' Vol. II. (2d ed. Leipsic 1863); Evans, 'The Story of Louis XVII. of France' (1893); Chantelauze, 'Louis XVII., son Enfance, sa Prison, et sa Mort au Temple' (1895).

Louis XVIII., "Stanislaus Xavier" (given the title of LE DESIRÉ, by the Chamber of Deputies), king of France: b. Versailles, France, 17 Nov. 1755; d. Paris 16 Sept. 1824. As the younger brother of Louis XVI. he was designated Monsieur, his rank in the nobility being Count of Provence. He early showed himself a political marplot, a hinderer of reform, and one of the great obstacles to his brother's success in handling the difficulties of the revolutionary movement. When the king escaped from the guards of the Tuileries (1791), Monsieur was by his side, and while Louis XVI. was seized and taken back to confinement, escaped to the frontier. With his brother, the Count d'Artois, he held court for some time at Coblenz, where he issued animadversions on the revolutionists in France, and seriously complicated the difficulties of the royalist cause by his want of temper and judgment. When the Duke of Brunswick invaded France, Monsieur and the Count d'Artois, joined his forces and shared his disasters. On the death of Louis XVI. (1793) the Count of Provence declared his nephew king, and when Louis XVII. died (1795) he took the title of king of France. He wandered from court to court of Europe, and finally settled in England (1807), where he remained until the fall of Napoleon. At last he crossed the Channel and entered Paris (3 May 1814) after an absence of twenty-three years. His reign was inaugurated with the bitter retaliatory measures of the White Terror (q.v.). When Napoleon made his escape from Elba and arrived at Paris (1 March 1815) the unpopularity of the Bourbon restoration was proved by the enthusiasm and devotion of those who flocked to his standard. The king fled from Paris, but, after the battle of Waterloo, was once more restored, entered the capital under the protection of victorious Wellington, and appointed a new ministry with Talleyrand at the head of it. Louis proceeded to disband the army, to exclude from the general amnesty those who came under the head of "rebels," those who had voted for the death of Louis XVI. and were consequently "regicides," and those who had received rank and honors from Napoleon in 1815. The rest of his reign was satisfactory neither to Blues nor Reds, and the real stay of the country was the Duc de Richelieu, the successor of Talleyrand. In accordance with the policy of the Holy Alliance the despotic Ferdinand VII. was re-established on the Spanish throne by a French army (1823) and the last year of the king's life was spent in disease, followed by paralysis, which carried off a feeble and illiberal monarch whose only work in life had been to prove that political disquiet in France had not been and was not to be allayed, by the restoration of the Bourbons. Consult Dulaure and Anguis, 'Histoire de la Révolution depuis 1814 jusqu'à 1830' (1834-8); Viel Castel, 'Histoire de la Restauration' (1860 et seq.).

LOUIS PHILIPPE — LOUISBURG

Louis Philippe, fê-lêp, king of the French: b. Paris 6 Oct. 1773; d. Claremont, near Windsor, England, 26 Aug. 1850. He was the eldest son of Duke Louis Philippe Joseph of Orleans, afterward surnamed Egalité, and of the Princess Louise Marie Adélaïde of Penthièvre. In infancy he held the title of Duke of Valois, and in 1785 that of Duke of Chartres. In 1782 his father entrusted the education of Louis Philippe and his other children to Madame de Genlis. Having entered the national guard in 1790, he became a member of the Jacobin Club. In May 1792 he commanded a brigade of cavalry in Luckner's army, rose under Kellerman in September to be lieutenant-general, and did good service in the famous cannonade at Valmy. He next joined the army of Dumouriez, and took part in the victory of Jemappes. Dumouriez had formed a scheme for placing him on the constitutional throne, and being included in the order of arrest directed against Dumouriez, in April 1793 he took refuge within the Austrian territory. After many wanderings he procured the situation of teacher of geography and mathematics in the school of Reichenau, near Coire, where, during eight months, he passed under the name of Chabaud-Latour. In 1796 Louis Philippe, since his father's death, Duke of Orleans, arrived in America, where, in the following year, he was joined by his two younger brothers. The three princes traveled in the United States, and at last took ship for England, where they landed in 1800. The brothers lived above seven years at Twickenham, near London. After the news of Napoleon's downfall the Duke of Orleans set out for Paris, where he was received by Louis XVIII., not without distrust, and in 1814 appointed colonel of hussars. On the news of Napoleon's return he set out for Lyons to assist the operations of the Count d'Artois. After an unsuccessful attempt to hold the northern departments for the Bourbons, he left Lille and set out for England to join his family, who had preceded him. He returned in July 1815 and obtained the removal of the sequestration of his domains which had been imposed by the imperial government. The estrangement of Louis XVIII. from him was, however, increased, and he withdrew in October 1815 to England, but returned to Paris in the following year. After the coronation of Charles X. his relation to the court became more friendly. During the bloody days of 27, 28 and 29 July, the court had entirely forgotten him. Nor during the struggle was his name mentioned in Paris. On the 29th the provisional chamber, on Laffitte's suggestion, resolved to offer him the regency as lieutenant-general of the kingdom. In a sitting of the chamber on 9 August he swore to the reform charter, and ascended the throne as king of the French. Being hated by the extreme Democrats, frequent attempts were made on his life; but during this period France made vast progress in industry and wealth, and the durability of the July throne seemed to be thereby consolidated. But his selfish policy had estranged the European courts, and a loud demand for a change in the electoral system being foolishly opposed by the king and the Guizot ministry, his position in France became extremely precarious. On 22 Feb. 1848 an insurrection began in the streets of Paris. Next day Guizot gave in his resignation; but the insurrection gained in extent and intensity, and neither the command given to the troops on the

morning of the 24th to stop firing, nor the abdication of the king a few hours after in favor of his grandson, the Count of Paris, sufficed to lay the storm. Louis Philippe, completely disheartened, unsupported by any administration, and forsaken even by the courtiers, about midnight of 24 February quitted the Tuileries with his family, and fled from Paris, and on 3 March 1848 took up his residence in England, which he never again left.

Louis D'Or, loo'ê dôr (Fr. 'golden Louis'), a gold coin formerly current in France. It was first struck in consequence of an edict of Louis XIII. dated 31 March 1640. It was 22 carats fine, and originally was worth 10 livres of the period (equal to 21 francs 33 centimes). Afterward it ranged in value from about \$4 to \$4.60. In 1810 the louis d'or was replaced by the napoleon of 20 francs, and when the coin was again struck under the restoration the same value (20 francs) was retained.

Louisa, loo-ê'za, queen of Prussia. See **LUISE, AUGUSTE WILHELMINE AMALIE, QUEEN OF PRUSSIA.**

Louisburg, loo'is-berg or loo'ê-berg, town of Cape Breton Island in the Province of Nova Scotia; on the coast at the entrance to the Gulf of Saint Lawrence. The earliest mention of English Harbor later called Louisburg is found on Champlain's Map of 1612 and was, in his time, the resort of fishermen mainly from England. It was not until 1713 that Louisburg came into prominence by the removal to it of the French officers and inhabitants from Newfoundland then ceded to England under the Treaty of Utrecht.

The city is chiefly noted for the historical events which transpired in and around it and for the ruins of the fortifications. These fortifications were commenced in 1720 and completed about the year 1744 at a cost to the French Government of 30 millions of livres equal to-day to about 10 millions of dollars. They enclosed an area of about 100 acres and had a circumference of 2½ miles.

On the declaration of war in March 1744 between France and England, Louisburg was the object of an attack by the expedition sent out by the New England Colonies. This was composed of 3,250 men from Massachusetts, 300 from Connecticut, 300 from New Hampshire, and 150 from Rhode Island, supplemented by 14 vessels, carrying 200 guns fitted out by the Provinces, and by Commodore Warren's West Indian fleet of 10 vessels carrying 460 guns beside the captured *Vigilante* of 64 guns. The siege, begun on 30 April 1745, ended in the capitulation by Governor Duchambon on 16 June.

By the Treaty of Aix-la-Chapelle in 1748, the Island of Cape Breton was restored to France in 1749, and the fortifications at Louisburg were considerably strengthened and a new battery erected at Point Rocheforth at a cost of \$5,000,000. In February 1758, two years after war had been declared between France and England, a second expedition, consisting of 22 ships of the line, 16 frigates and 120 transports with 11,000 troops, invested the fortifications and on 27 July the troops under General Wolfe entered the fortress. Thus Louisburg became a possession that settled for all time the future of Canada.

Shortly after the capture the British Government ordered that the great fortress be razed

LOUISEVILLE—LOUISIANA

to the ground and to-day only the casements or bomb-proofs remain. The ruins are now being preserved and under the patronage of King Edward VII a memorial tower is to be erected bearing the names of the killed and wounded in both sieges.

Louisburg is now becoming a port of considerable importance, having been established as the eastern terminal port of the Intercolonial railway and used by the Dominion Coal Company and by the Dominion Steel Company as a shipping port for a large portion of their products. See COLONIAL WARS IN AMERICA.

Louiseville, loo'èz-vîl, or **Rivière du Loup**, rê-vê-à dü loo, Canada, town, capital of Maskinongé County, in the province of Quebec; on Lake Saint Peter, an expansion of the Saint Lawrence River; and on the Canadian Pacific railroad; about 18 miles west of Three Rivers. The mineral springs of Saint Léon, in the vicinity, bring many people to Louiseville. The chief industry is tanning leather, but flour and dairy products are among the manufactures. Pop. (1901) 1,055.

Louisiade (loo-ê-zê-äd) **Archipelago**, in the Coral Sea, southeast of New Guinea; belongs, administratively, to British New Guinea. The largest islands of the group are Southeast (Sudest) Island, Saint Aignan, and Rossel. Southeast Island is about 45 miles long and from 4 to 10 miles wide. Rossel and Saint Aignan each have an area of over 100 square miles. They are all mountainous. Saint Aignan has a peak about 3,500 feet in height. Many of the small islands are of coral formation; and the vegetation is varied and luxuriant. The islands were discovered in 1666 by Torres, and became British possessions in 1888. The majority of the inhabitants are uncivilized, and are of the Papuan race.

Louisiana, one of the United States, bordering on the Gulf of Mexico; one of the largest and most important of the Southern States. The name "Louisiana" was first applied by La Salle in 1683 to the vast territory watered by the Mississippi and its tributaries, which he thus dedicated to King Louis XIV.

It was the fifth State admitted to the Union under the Federal Constitution. It lies between lat. 28° 59' and 33° N., and lon. 88° 40' and 94° W. Its extreme length is 300 miles, and extreme width 240 miles, with an area of 41,346 square miles. It is bounded on the north by Arkansas on parallel of 33° to the Mississippi and thence on the parallel of 31° to eastward Pearl River, on south by the Gulf of Mexico, on the west by the Sabine River and a line drawn from it directly north to meet the 33° parallel. Within these limits are included 445,420 square miles of land and 3,300 of water, 540 in rivers and 2,760 in lakes. The State is divided into 59 parishes gradually created from the five original divisions under French and Spanish domination.

Rivers and Lakes.—The Mississippi River in its devious course splits Louisiana in twain with 37,000 square miles on the western bank. With but rare interruptions the river flows through alluvial soils of low elevation requiring the protection of levees. The coast line of the delta and eastward consists of lands little above

sea level intersected by small tracts of elevated prairies and low ridges covered with live oak. Northwestward the land rises until in north Louisiana the hills attain the height of 500 feet. Both on the Mississippi and the other river valleys, the highest land is formed by the banks themselves, from which the land slopes away gradually to the marshes. To protect these low-lying lands there have been built at vast expense some 1,500 miles of levees of great strength. These, however, give way occasionally before the mass of waters brought down by the Mississippi in flood, and great damage results. (See **LEVEE**.) The drainage system of the State is toward the Gulf and mainly through the Mississippi and its tributaries, the Red River and the Ouachita. On the east Pearl River and on the west the Calcasieu River and the Sabine, which divides Louisiana from Texas—each drain small districts. The Red River formerly flowed directly to the Gulf of Mexico. Its old channel is now filled by the Atchafalaya, which has increased so rapidly of late years as to give rise to fears of its becoming the main channel of the Mississippi. The lakes of Louisiana are of three kinds. Those on the coast are shallow estuaries enclosed within the delta, of which the greatest are lakes Pontchartrain and Maurepas. At the entrance to the former is Lake Borgne. A second class is formed by the curved sections of the river which are cut off and silted up as in the smaller rivers by the action of accumulated debris and rafts of driftwood such as are found above Shreveport. These are rapidly disappearing through the removal of the obstructions, and the lands are being reclaimed.

Of the 28,000,000 acres of land in the State only 3,000,000 are in cultivation. Nearly the entire upland is covered by strata of drift or red sandy clays. One thousand nine hundred square miles are alluvial. The soil next the river is the lightest or soundest, the surface of the backlands consists of a peculiarly friable soil known as buckshot to such a depth as to permit of the deepest cultivation and with a high absorptive power which secures crops against drought. South of the Red River the soils are less varied in character, but all are rich in the essential elements of plant food and require only drainage and good culture to produce excellent crops. The land is distributed as follows: Alluvial lands, 13,225 square miles; bluff prairies, 5,739 square miles; oak uplands, 8,103 square miles; long-leaf pine hills, 7,582 square miles; long-leaf pine flats, 2,556 square miles; central prairies, 785 square miles; coast marshes, 7,420 square miles.

Geology and Mineralogy.—The entire State is part of the Mississippi deposit on the bottom of an ancient gulf whose shore touched Cairo, Ill. Its oldest sediments were Cretaceous, now covered except in a few small spots in the northwest. The upland region west of the northern course of the Calcasieu, and of the Washita, is a mass of horizontal Tertiary beds, clays, and clay sandstones. The entire alluvial region and coast swamps, besides much bordering prairie, is Quaternary. Such formations could hardly be rich in minerals, and though some iron ore and low-grade brown coal are found in the Tertiary districts, the only important minerals are rock salt, sulphur and petroleum. The salt is found in the chain of isolated hills known as Islands,

LOUISIANA

commencing with Petite Anse on the Gulf, and extending to New Iberia. The first workings were at Avery's Island; recently two other mines have been opened and the output will be largely increased. The oil fields in Calcasieu and Saint Martin's parishes give promise of exceeding those of Texas in extent and value of product. The sulphur is also in Calcasieu Parish.

Climate and Rainfall.—Louisiana, ranging from the parallel of lat. 33° to 29° N. is semi-tropical in climate and products. The summer heat reaches 105, and averages 85 for the hottest month; it does not reach zero south of Shreveport, and the coldest month ranges on an average from 45° to 60°, according to location. The gulf vapors make it very equable, the prevailing winds being south and southwest,—that is, from the ocean. There are only three months of frost in the year, the beginning varying from the first of November to the first of December. The rainfall varies from an average of 60 inches a year in the southeastern part, to 50 in the northern. This abundant moisture and the steady warmth cover the State with luxuriant tropical growths, and the magnificent profusion and beauty of its flowers are famous. The magnolia is most familiar as a specially southern product, but the roses, jasmines, oleanders, camellias, etc., are notably beautiful. The orange, fig, and most other semi-tropical fruits will flourish here.

Fauna.—The only large quadrupeds surviving are black bears and a few catamounts in the less accessible forests and swamps. Many deer are found during the winter. The wildcat is not uncommon, and the raccoon and opossum are familiar. The alligator is common to all bayous and ponds. Bird-life is plentiful; it comprises eagles and vultures, pelicans and cranes, beside wild turkeys, geese, and ducks. There is an excellent State game law.

Forestry.—A large proportion of the entire forest wealth of the United States is represented by the immense areas of long- and short-leaf pine. It is estimated that there are standing respectively 26,588 millions of long-leaf pine and 21,628 millions of short-leaf pine, occupying 15,000 square miles of upland. In the swamps are vast forests of red and white cypress, the value of which has only recently been recognized. Other valuable woods which are to be found in large quantities on the bluff lands and inland streams are ash, oak, beech, walnut, and cotton wood.

Agriculture.—From the considerations mentioned, an exceptionally fertile soil, a warm climate with variations from northern highlands to southern coast plains, Louisiana has remarkable natural advantages for a great variety of products, from temperate to semi-tropic. Yet less than two fifths of the soil in 1900 was even nominally in farms, and less than one sixth improved; and of the total of \$61,272,676 in value of farm crops, \$56,395,227, or over eleven twelfths, was in two money crops and two food crops, cotton and sugarcane, corn and rice. This lack of diversification of crops is largely a result of the old slave system, which tended to concentrate attention upon a few staples roughly cultivable by gangs; and the break-up of the system added new difficulties to the old industries for many years without any tendency to create new especially as the land had been exhausted by wasteful

cultivation and lack of fertilizing. There are some indications of a change; but the chief feature has been the enormous development of irrigated rice culture, as told below. There has also been a progressive subdivision of farms; the average plantation of 1860 was over 500 acres, the average farm of 1900 was under 100. This does not, however, imply the cessation of large farms; on the contrary, Louisiana is emphatically the State of great plantations outside the ranching States, there being in 1900 over 1,100 containing more than 1,000 acres each. This is due to the heavy capital needed to carry on the sugar business, which must have a large territory to make fair returns. One result of the growth of the class of colored farmers, besides the cutting up of farms,—their average being 40 acres to 150 for the white farmer,—is the increase of rentals, they being usually too poor and unthrifty to buy. They slightly outnumber the white farmers, but they own only about one seventh of their farms against nearly two thirds owned by the whites, and there are nearly three times as many cash tenants and two and a half times as many share tenants as white. They operate but about one fifth of the farm area, however. In cotton culture, Louisiana has been slower to recover from the Civil War than any other State, having not yet reached the figures of 1860, while several others have immeasurably surpassed them, and it has not greatly grown since 1890. Its product in 1899, though exceeded by six other States, was 44 per cent of the total crop production, being 709,041 bales, valued at \$27,004,812. The crop of 1902-3 was 884,000 bales of an average value of \$44.52 per bale. Sugar, the next crop in value (\$14,627,282), is Louisiana's great specialty; it produces three fourths of all the cane grown in the United States, outside of Hawaii, and more than 11 times as much as the next heaviest producer, Georgia. This is an extensive crop, concentrating a great value on a small area; while the value of the crop was over half that of cotton, its acreage was only one fifth as much; with nearly one fourth the total value of farm products, it occupied only 8 per cent of the farm acreage. One of the great drawbacks to Louisiana sugarcane raising, is that about one fifth has to be kept for seed, and cannot be replaced in the same season, while in Cuba the tops of unfit canes are simply dropped into hoe-made holes, and there are plenty always to be had; the Louisiana seed cane often rots, the Cuban never. The Cuban cane is also much richer in sugar, and the yield per acre is about double. From all these causes, the cost of making a pound of sugar is about double in Louisiana what it is in Cuba. Corn, as in all the Southern States,—owing to its value as a food crop, for feeding swine, and in some States for distilling,—has always had far greater attention than any other cereal; in 1900 it was nearly three fourths of the entire cereal crop, valued at \$10,327,723, and increased over 60 per cent in the next decade. But the great coming food crop is rice, whose culture increased about two and a half times in the last decade, and nearly all of this in the last three years; owing to the introduction of improved methods by a quantity of Iowa immigrants, and of a new system of irrigation, which has revolutionized rice culture and worked a complete transforma-

LOUISIANA

tion in the great coast-prairie belt of southwestern Louisiana, and southeastern Texas, formerly almost in primitive solitude. Up to 1897 nearly all the rice grown on these prairies was "Providence" rice, dependent mainly on rainfall. Then two years of drought showed that there was no security without irrigation, and there was a stampede to the "pump lands," where a new world was created by raising water from bayous. This district, as above said, is full of slightly raised ridges; the canals are run along these, not by digging, but by throwing up parallel dikes for a channel; as the water in all these regions lies below the land to be irrigated, it is raised by pumping plants at the heads of the canals, and distributed to the lands by gravity; sometimes two or more pump stations are needed on the same canal to lift the water high enough. This immense draft on the water supply has created alarm for the future; but the whole region is underlaid with exhaustless water-bearing gravel strata, and easily bored wells can irrigate 100 acres without diminishing the flow. In 1900 over 25,000 acres were thus irrigated. This prairie has the further advantage over the delta district, formerly the chief seat of the culture, that in the latter the heavy machinery needed for improved cultivation was apt to sink in the soil. The celebrated perique tobacco is grown in the Parish of Saint James. The product in 1902 was 33,375 pounds.

Stock Raising.—While this is small relatively to the other agricultural branches, it is of some importance; and in the line of dairy products is increasing. These were valued at over \$4,000,000 in 1900, of which something over \$1,000,000 was sold off the farm. Swine slightly increased, sheep slightly decreased; but as natural with increasing farm work of any kind, horses, mules and asses increased considerably more than half.

Fisheries.—Louisiana ranks next to Florida among the Gulf States in the value of its fish catch. As a whole, however, the industry seems not to be increasing largely; the last report in 1897 showed a total little larger than 1890, the figures being \$713,587, the number of men employed 4,403, chiefly on the boat or inshore fisheries. The oyster fishery is second only to that of Chesapeake Bay, and was three fifths the entire value of the fisheries. The oyster reefs extend almost unbroken to the mouth of Atchafalaya Bayou to the State line. Large canneries have been established on the Gulf. The seine fishery is declining; but Louisiana is still the chief source of shrimps, as well as for catfish caught with the trot-line. The alligator catching industry is decreasing with the gradual exhaustion of the supply; at the same time the scarcity of hides constantly enhances the market value.

Manufactures.—These are chiefly concentrated in New Orleans, which produced in 1900 more than half the total for the State, which with 4,350 establishments, was valued at \$21,181,683. In the eight chief industries of the State, making more than half the total, there was over a threefold increase from 1890 to 1900, and what is very unusual, there was almost exactly the same increase in the number of wage-earners who number 42,210; the industrial tendency is to increase product, but reduce human labor. The total bulk of manufacturing

in the State is working up its raw materials of sugarcane, cotton, forest products, and rice. Foremost, and amounting to close upon two fifths of the State's entire manufactured products, is the refining of sugar. The sugar and molasses produced in the census year were valued at \$47,891,091, and the business gave employment to 15.4 per cent of all the State's wage-earners. The greatest obstacle heretofore (aside from difficulties stated under *Agriculture*) has been the necessary idleness of the expensive plants during the greater part of the year; but an industry is now developing which serves a doubly profitable end,—the making of paper from the bagasse or cane refuse,—thus keeping the plants going, and utilizing a waste product heretofore used only for fuel. With a little jute or manila, this has been found to make one of the finest grades of heavy paper. Second in importance was the manufacture of lumber and timber products, aside from planing-mill products, sashes, doors, and blinds, etc., these were valued at \$17,408,513, and had more than trebled in the decade. In 1890 the production was almost exclusively of yellow pine lumber, cypress shingles, and white oak staves; in 1900 there had been a great increase of the manufactures from cypress and hardwoods, cypress sawing alone employing many of the largest establishments in the State, and the stave manufacture having practically ceased. The lumber industry is just beginning to attract the attention of capitalists on a large scale,—this and rice being the business "booms" of the present. At no time in the State's history have there been so many large lumber plants under construction. The long-leaf pine manufacture has its centre at Lake Charles, in the southwest. The manufacture of cottonseed-oil and cake holds third place; in 1900 the products were valued at \$7,026,452, while in 1890 they were somewhat over one fifth that amount. This is one of the industries fostered indirectly by the Mississippi jetties, which by increasing New Orleans' distribution facilities, have made it worth while to import cotton seed and develop a larger manufacture than the local supply would make possible. The refining of cottonseed-oil is a recent New Orleans industry. The cleaning and hulling of rice produced \$5,736,451 of finished product. A great and rapidly developing industry is the manufacture of burlap bags for handling cotton seed, fertilizers, etc.; it grew from \$669,945 in 1890, to \$3,443,468 in 1900. The foundry and machine-shop products amounted to \$2,672,761, their work largely in making and repairing sugar machinery. Planing-mill products and carshop work were considerable. There were in Louisiana in 1902-3 eight cotton mills with 101,752 spindles; the consumption was 18,003 bales of cotton. Many new mills are in construction.

Commerce and Transportation.—Louisiana is the richest State in the Union in total length of navigable streams, 3,771 miles. Its lower part is a vast web of paths to the ocean, aggregating 2,500 miles. The entire 600 miles of the Mississippi's length in the State is navigable and largely navigated, and the jetties have trebled its value, made New Orleans a far greater corn and cotton port than before, and will draw foreign commerce still farther. A canal from the river to Lake Borgne has greatly lessened the dis-

LOUISIANA

tance from the city to the Gulf and to the coal-fields of Alabama, hence reducing the cost of fuel for manufacturing purposes. The railroad facilities have not been very extensive till the last decade, when they increased from 1,739 to 2,801 miles, and are now 3,221. The growing importance of New Orleans has led a number of trunk lines to make a special effort for its business; owing to the nature of the Gulf coast, all turn away many miles from it. The chief lines are the Southern Pacific, the Texas Pacific, the Louisville & Nashville, the Queen & Crescent, and the Illinois Central. Many others are laying plans for entering the city. As with most Western and Southern States now, rates are fixed by railroad commission. New Orleans is the third port in the United States in amount of foreign commerce, next to New York and Boston. For the year ending 30 June 1902, its imports and exports (principally the latter) amounted to over \$158,000,000. In 1902-3 it received 2,316,617 bales of cotton, and exported 2,112,281 bales. The vessels entering and clearing for the year were upward of 4,000, with a gross tonnage of nearly 5,000,000.

Banks.—The State has an excellent banking system, very conservative in its holdings of reserves; the New Orleans banks were notable for their exceptional solidity and punctuality in meeting northern obligations when the Civil War broke out. On 30 June 1902 there were 27 national banks in operation, with \$4,182,580 capital, \$2,667,364 in outstanding circulation, and \$2,372,750 in United States bonds. There were also 66 state banks with \$4,255,287 capital, and \$631,295 surplus. In the year ending 30 Sept. 1902 the exchanges at the United States clearing house in New Orleans aggregated \$663,918,045, an increase in two years of \$163,000,000.

Government and Finance.—The Constitution of 1898 was devised to exclude the illiterate negro vote, except for owners of property to over \$300 who are excepted from educational qualification. Otherwise than that, each voter must be able to fill out his application blank for registration, but this does not apply to anyone who was a voter on 1 Jan. 1867 (that is before the 14th or 15th Amendment was passed), or his son or grandson of mature age. Women taxpayers can vote on all questions of taxpaying in any subdivision of the State. State officers are elected for four years. The Governor has \$5,000 salary, the pardoning power, and a veto by items, which may be overridden by a two thirds vote of the elected members of each house. The legislature holds biennial sessions limited to 60 days; both houses are elected for four years; the Senate may be from 36 to 41 in number, the House from 98 to 110, and as a fact the numbers are now 39 and 114; there must be one representative to each parish, and to each ward of New Orleans. The judiciary is headed by a supreme court, consisting of a chief justice and four associates appointed by the governor with the consent of the senate, for 12 years. There are judicial districts, to be not less than 20 nor more than 20; the judges are elected for nine years, as is the district attorney for each. From and after 1 July 1904 there is to be a court of appeals, composed of two district judges designated by the supreme court. There is a militia of 2,693. The State

has a large Democratic majority. It sends two Senators and seven members to Congress. The assessed valuation of property in 1902 was \$301,216,222; the State tax is limited to six mills on the dollar. The legislature cannot incur debts except to repel invasion or suppress insurrection. A poll tax on each adult male goes to the school fund (see *Education*). The bonded debt 31 Dec. 1902 was \$11,108,300, with a floating debt of \$1,157,002. The year's receipts from taxation was \$2,747,262.

Education.—Louisiana, formerly near the foot of the ladder in the general education of its people, has made extraordinary efforts in the past two decades, and in some respects has surpassed all other Southern States; a fact more creditable from its large negro population. The average school term (120 days) was the longest of any Southern State, the terms of colored schools were as long as those of the white, and the amount expended is exceedingly creditable, being in 1901 \$1,236,647, or nearly half as much as the current receipts of the State, and in 1902 nearly \$1,500,000. The school revenues are made up of 1¼ mills from the State property tax of six mills on the dollar, a poll tax of \$1 on all males over 21,—retained in the parish were levied, and other local taxes may be laid,—special corporation taxes, etc. By the law of 1902, the school administration is centralized in a State board of education consisting of the governor and seven appointees, the superintendent of education, and the attorney-general; this appoints a four-year board of education for each parish (county), who appoint parish superintendents. The enrolment in schools during 1901 was 63 per cent of the white children from 6 to 18, and 40 per cent of the colored; in both cases more than a three-fold increase in 20 years. Despite all efforts, however, the load of illiteracy is a heavy one to struggle against; 61 per cent of the negro and 17 per cent of the white population above 10 could neither read nor write. In 1901 there were 3,219 white teachers, nearly three fourths female; and 1,152 colored teachers, about evenly divided. Besides these there were many hundred private teachers. The pupils in the Catholic schools alone were stated at 23,398. Total pupils enrolled in common schools were 198,896. For higher education there were 22 public and 30 private high and secondary schools, two industrial colleges, the Industrial Institute at Ruston (north Louisiana) and the Southwestern Industrial Institute at Lafayette, two normal schools, the State at Natchitoches, and that of the city at New Orleans; the State University and Agricultural and Mechanical College at Baton Rouge, partly supported by the United States; Tulane University, with affiliated special colleges, one of the best reputed institutions in the South; and a number of Roman Catholic and sectarian colleges. For the colored people are four—Southern University, Leland University, New Orleans University, and Straight University. Total income for universities and colleges \$284,623. Male students 1,518, female 563.

Charitable and Penal Institutions.—The State Board of Charities and Corrections can only inspect and report. The old system of leasing out convicts to private contractors was abolished by the constitution of 1898, and they are now only employed on public works or convict farms,

LOUISIANA.

STATE CAPITOL AT BATON ROUGE.

LOUISIANA

or in manufactures owned and operated by the State; and parish jail inmates may be employed on public works within that parish. The State Insane Asylum is at Jackson, a Lepers' Home in Iberville Parish, institutions for the deaf and blind at Baton Rouge, and there are State hospitals at New Orleans and Shreveport. The health of New Orleans is regulated by the State Board of Health, composed of nine physicians, four appointed by the governor, and five by the New Orleans City Council.

Churches.—The strongest denominations in order of church societies, are the Baptists, Southern Methodists, the two forming the bulk of the Protestants, Roman Catholics, Presbyterians, Protestant Episcopalians, Lutherans, and Unitarians. The Roman Catholics are stronger here from the long Spanish and French domination than anywhere else in the South. In New Orleans are located a Roman Catholic archbishop and bishops of the Protestant and Methodist Episcopal churches. There is also a Roman Catholic bishop at Natchitoches.

History.—The earliest knowledge of Louisiana dates from the discovery of the mouth of the Mississippi in 1528 by Narvaez. De Soto, 13 years later, crossed the great river on rafts at some point about the Arkansas; of the importance of this discovery the Spaniards were wholly ignorant. The next Europeans to sail on the great river were the French. In 1673 Marquette and Joliet were sent by the governor of Canada to seek the river which might lead to the great western ocean. They descended as far as the mouth of the Arkansas. In 1682 they were followed by La Salle, who completed the work of discovery and took possession of the country, which he called Louisiana, in the name of Louis XIV. In 1684 he sailed from France with colonists to form a settlement. He missed the mouth of the river, landed at Matagorda Bay and was murdered in 1687. Brave men were not lacking to take up the enterprise, and in 1698 Iberville, with his brother, Bienville, sailed from Brest for the Mississippi. Finding the Spanish in possession of Pensacola, he stayed for a short time at Mobile, and then entered and explored the lower part of the rivers. His first settlement was at Biloxi, despite the protest of the Spanish governor of Pensacola. In 1702 the site of the colony was removed to Mobile. Antoine Crozat obtained the concession of Louisiana in 1712. It was handed over for 25 years to the Western or Mississippi Company, founded by John Law. Bienville was again made governor and was able to carry out his long-formed plan to create a city where is now New Orleans. Later, in 1722, he was able to make it the capital of the colony. The Western Company sent out large numbers of emigrants, and the colony increased in population, but not in prosperity; misgovernment and Indian wars prevented all progress. In January 1732 Louisiana was surrendered to the king. Iberville resigned in 1743 and was succeeded by Vaudreuil, under whom were issued levee ordinances and police regulations for New Orleans. In the following years there was no improvement in the condition of the colony, of which the annual expense was a drain on the exhausted resources of France. In 1762, by the treaty of Fontainebleau, Louisiana west of the Mississippi, together with the island of Orleans, was ceded to Spain, and in the next

year Louisiana east of the Mississippi, together with Florida, was surrendered to Great Britain by the Treaty of Paris. The dissatisfaction of the Louisianans, and the long delay of Spain in taking possession of her new colony, gave rise to a serious revolt which was sternly suppressed by O'Reilly. He, however, provided for a form of government under which the colony made considerable progress. The great growth of the population on the upper Mississippi caused a demand for freedom from all restrictions of commerce on the river. This was obtained temporarily by concessions from the Spanish governors, but when the right of deposit was refused in 1803, there was grave danger of a descent on New Orleans. The desire of Napoleon to create a colonial empire in America led to the secret treaty of St. Ildefonso in 1800, by which France acquired that portion of Louisiana formerly ceded to Spain. In 1803 fear of English invasion induced Napoleon to sell Louisiana to the United States for \$15,000,000. (See ANNEXATION; LOUISIANA PURCHASE, for statistics of size and location.) On 28 March 1804 the part south of lat. 33° N. was organized as Orleans Territory; the northern part being organized as Louisiana Territory, afterward changed to Missouri Territory. An enabling act was passed 20 Feb. 1811 to form Orleans into a State, and it was admitted 8 April 1812. The French element was so strong that the constitution allowed members of the legislature to debate either in French or in English, and the dividing line in politics was usually between the two, with temporary alliances of other elements. The organization of the Whig Party, one of whose cardinal tenets was protection, which helped sugar, turned Louisiana into one of the strongest Whig States in the South, she twice voting for Whig Presidents. The slavery issue, after 1860, made it more and more strongly Democratic, and in 1860 it was heavily for secession. New Orleans was captured by the Federal troops 25 April 1862, and the State government, whose seat had been Baton Rouge since 1852, was transferred to Opelousas. During the rest of the War the territory held by the Federals was recognized as the legitimate State government, though under a military governor, and sent members to Congress. On 30 July 1866 an attempt of the colored leaders to hold a constitutional convention at New Orleans and secure the admission of their race to the franchise, resulted in the massacre of many of the delegates by the whites; which had much to do with the excessive severity with which the subsequent Reconstruction government bore on the latter. (For the general history of the time, see RECONSTRUCTION. For the part borne by the State in the imbroglio of 1876, see ELECTORAL COMMISSION.) The most important item in the subsequent history was the passing of the Constitution of 1898, with the "Grandfather Clause," to disfranchise the negroes, which has reduced the negro registration to about 7,000, as against over 120,000 whites. The State governors have been W. C. Claiborne 1812, Villere 1816, T. B. Robertson 1820, H. S. Thibodeaux 1824, H. Johnson 1824, P. Derbigny 1828, A. Beauvais 1829, J. Dupre 1830, A. B. Roman 1831, E. D. White 1835, A. B. Roman 1839, A. Mouton 1843, I. Johnson 1846, J. Walker 1850, P. O. Hebert 1853, R. C. Wickliffe 1856, T. O. Moore 1860, H. W. Allen 1864, M. Hahn

LOUISIANA—LOUISIANA CREOLES

1864, J. M. Wells 1865, B. F. Flanders 1867, J. Barker 1868, H. C. Warmouth 1868, P. B. S. Pinchback 1872, W. P. Kellogg 1873, F. T. Nicholls 1877, L. A. Wiltz 1880, S. D. McEnery 1881, F. T. Nicholls 1888, M. J. Foster 1892, W. W. Heard 1900. The following are the names of the principal authors who have written on Louisiana: *History*: Le Page, DuPratz, Martin, Gayarre, Fortier. *Description*: Darby, Stoddard. *Botany*: Rafinesque, Chapman. *Ornithology*: Audubon. *Literature*: Fortier. *History and Development of New Orleans*: Cable, King, Castellanos.

Population.—The census figures from 1810, when it was first counted separately as the Territory of Orleans, are as follows: (1810) 76,556; (1829) 152,923; (1830) 215,739; (1840) 352,411; (1850) 517,762; (1860) 708,002; (1870) 726,915; (1880) 939,946; (1890) 1,118,587; (1900) 1,381,625. It was estimated in 1903 at about 1,470,000. The foreign born were 52,903, of whom 17,431, or about one third, were Italians, 12,604 Germans, 6,500 French, and 6,436 Irish. The colored population was 659,804, or nearly half, a relative decrease since 1890 of over 12 per cent, due to the higher death rate among the negroes. Louisiana was sixth in absolute number of colored inhabitants, and third in relative number, next below Mississippi and South Carolina. There are 59 parishes or counties in the State. The legislature is forbidden to create new ones with less than 625 square miles and 7,000 inhabitants, or divide an old one so as to leave either portion less than these magnitudes. There are no large cities, except New Orleans with 287,104 people, in 1900, and in 1904 over 300,000; the great Mississippi port, and destined to a much larger growth. Shreveport, the next, on the upper Red River, had 16,013; Baton Rouge, the capital, on the Mississippi, 11,269. The only others above 5,000 are New Iberia in the south and Lake Charles in the southwest (the latter the head of the long-leaf pine manufacture), Alexandria on the lower Red River, and Minden east of Shreveport.

Sociology.—Owing to the preponderance of the population and the general importance of New Orleans it has been found useful to locate there institutions usually found at the State capitol. The Supreme Court sits in the Cabildo on Jackson Square, and the State Library is also in the city. The two most important libraries in the State are the Howard Memorial Library for reference, and the New Orleans Public Library for circulation established, which provide for the public of New Orleans the use of nearly 100,000 books. There are published in the State 188 newspapers, of which two, the New Orleans *Picayune* and the New Orleans *Times-Democrat*, are important dailies. The literature of the State consists of two groups of writings: the one in French covering the period between 1835 and 1855, including those of Gayarre and Rouquette, and a brilliant series of works in English prose and poetry by Townsend, King, Davis, Fortier, Picklen, etc., which have been produced in the last 30 years of the 19th century.

WILLIAM BEER,

New Orleans.

Louisiana, Mo., city, in Pike County, on the Mississippi River; and on the Chicago & A.,

and the Chicago, B. & Q. R.R.'s; about 85 miles northwest of St. Louis. It is situated in an agricultural region, and is the trade centre for a large extent of country in both Missouri and Illinois. Its chief industrial plants are flour and lumber mills, button factories, brick yards, lime works, tobacco factories, wagon and carriage factories. Nearby are large quarries and extensive nurseries. The trade is chiefly in its manufactured articles, dairy and nursery products, grain, fruit, and live stock. There is a good public library. Pop. (1900) 5,131.

Louisiana, Code of. In the history of law in the United States the first important experiment with a code in the United States was made in Louisiana, which State, originally a French colony, afterward ceded to Spain, again returned to France, and subsequently acquired by the United States from France, has had many changes of law. After the United States acquired Louisiana there arose a strong demand for a code, owing to the great confusion of laws. In 1806-8 a code was adopted, but only to supersede the ancient laws when they conflicted with it. A complete civil code was adopted for the State in 1824, which had for its basis the *Code Napoléon*, although some provisions of the common law were injected into it. The Louisiana code was the foundation for a later code prepared for the State of New York under the guidance and supervision of David Dudley Field. This code, although published, and having formed the foundation for many of the codes adopted by the various States, was never accepted by the legislature of New York. See CODE.

Louisiana Creoles. This appellation belongs exclusively to persons of French and Spanish descent born in Louisiana; notwithstanding the prevalent error to the contrary according to it Louisiana-born children of any European blood. Though often misrepresented, the creoles of Louisiana, as a matter of fact, are intelligent, brave and generous, and are, by no means, inferior in the matter of education; they are also in the enjoyment of the highest social privileges. The women of true creole lineage are world-famed for grace and beauty. The creoles have furnished Louisiana some of its ablest governors, its most distinguished military men, its eminent writers, its leading professional men, financiers and merchants. In 1904 they held a number of the most exalted offices in the State, and were likewise fully represented in all branches of high and meritorious effort. Very many of the creoles now in Louisiana are descended from high and noble families in France and Spain, and they treasure the lofty traditions of their ancestry. The expression "creole negro" is often used, and its employment has perhaps contributed to the false impression which some entertained that the Louisiana creole, truly such, must be, or is, of negro blood. The term under immediate consideration simply means that the negro to whom it is applied, or his progenitors, has been reared under a creole master. So far as the true creole families are concerned, they have been jealous of their Caucasian lineage and careful to maintain the purity of their blood. The word "creole" is often used to designate the origin of certain products of the field and farm, such as creole chickens, eggs, butter, etc. The meaning of

LOUISIANA — LOUISIANA PURCHASE EXPOSITION

this is that the products thus named are strictly from creole portions of the State of Louisiana. A certain debased idiom of the French employed among negroes, and, to some extent, among creole children and lower whites, is popularly called "creole." It has figured in literature in the shape of short stories, proverbs, etc. The better element of creole adults speak and write the French language in its purity. The majority likewise, have a correct and fluent use of the English language. An effective answer to the aspersions, by some sought to be cast upon the character of the olden creoles, is the following citation from the Chevalier Guy Soniat du Fossat, a distinguished officer of the French army who was in New Orleans in 1751. In his 'Synopsis of the History of Louisiana, etc.,' he gives the following:

"Creoles are defined to be 'the children of Europeans born in the colony.' They, in general, measure about 5 feet 6 inches in height; they are all well shaped, and of agreeable figure; they are lively, alert, and agile, and, notwithstanding the great heat of this climate, are laborious. They are born with ambition, and an honest self-esteem. They are endowed with a natural disposition for all sciences, arts, and exercises that amuse society. They excel in dancing, fencing, hunting, and in horsemanship. Nature has favored them with a penetrating and active mind, and they are capable of being easily instructed. The lack of teachers renders their education somewhat incomplete, and it must be said, in all justice, that among the many qualities which they possess are politeness, bravery, and benevolence. They are good fathers, good friends, and good kinsmen.

"The women, besides having the qualities above enumerated, are agreeable in figure and seldom deformed. They make good mothers, and are devoted to their husbands and their children, and in their marital relations seldom are they unfaithful. I must also add that the stranger arriving in this wild and savage country will be surprised to see in this capital, as exists in all countries of Europe, brilliant assemblies where politeness, amiability and gayety reign supreme."

BUSSIÈRE ROUEN,

Louisiana, District of. See ORLEANS, TERRITORY OF.

Louisiana Purchase, The, was the purchase by the United States from France of the Province of Louisiana, the treaty of sale being dated 30 April 1803. The price paid for the province was \$15,000,000. Its area was 875,000 square miles (almost as great as that of England, Ireland, Scotland, Wales, France, Germany, Spain, the Netherlands, Italy and Switzerland), as compared with 820,944 square miles in the original 13 States. Its limits extend from the Mississippi River on the east (including the New Orleans district east of the Mississippi) to the main divide of the Rocky Mountains and to the Arkansas, the Red and the Sabine rivers on the west; and from the Gulf of Mexico to the Canadian line.

The results of this transaction were to prevent forever the erection of a hostile power on

the west bank of the Mississippi and to make inevitable the ultimate annexation of Texas, Oregon, New Mexico, and California, and the expansion of the United States into a nation of continental proportions and of world influence. It was perhaps the most important sale of territory ever made. President Jefferson wanted New Orleans in order to control the mouth of the Mississippi on the east side, and offered to guarantee to Napoleon all the territory west of the Mississippi if this inducement became necessary in order to get that town. Looking for a city, he had an empire thrust upon him. Napoleon's necessities — his war with England, his desire for money to aid in prosecuting the war, his determination that England should not gain the territory, and his wish to raise up a rival to England on sea and land — worked to the eternal advancement of the United States, of representative institutions, and of the world's progress.

The wilderness which Jefferson's enemies ridiculed him for buying comprises to-day, in whole or part, chiefly in whole, 12 States — Louisiana, Arkansas, Missouri, Iowa, Minnesota, North Dakota, South Dakota, Nebraska, Kansas, Colorado, Wyoming and Montana — and Oklahoma and the Indian Territory. This region is nearly a third of the area of the present United States, and it gives homes to almost a fifth of its inhabitants. Its population of 50,000 in 1803 had expanded to 14,708,616 in 1900, or nearly three times the population of the entire United States in 1800, and in 1904 amounted to nearly four times the whole country's population at the time Washington was first inaugurated as President.

The States and Territories of the Purchase produced 264,000,000 bushels of wheat in 1900, valued at \$152,000,000 — more than half of the wheat crop of the whole United States; 1,013,000,000 bushels of corn, or 48 per cent of the country's product; 38 per cent of the country's oats. The wheat, corn, oats, rye, barley, cotton, hay and potatoes produced in this region in 1900 brought \$755,000,000, and its farm animals were valued at \$825,000,000, 38 per cent of those of the whole country.

Besides transferring the United States' boundaries from the Mississippi ultimately to the Pacific, the Louisiana annexation and its direct results, the acquisition of Texas, of New Mexico, of California and of Oregon, swung the seat of the country's activities across the Alleghenies into the great valley. The geographical centre of the contiguous parts of the United States is in northern Kansas, in the heart of the Louisiana Purchase, and the other pivotal points are traveling rapidly in the same direction. The centre of population, which was a few miles west of Baltimore in 1801, when Jefferson was first inaugurated, was near Columbus, Ind., in 1900; and the centre of manufactures, which was hurrying after it, was close to Mansfield, Ohio, in the same year. At the same time the centre of the corn production was 54 miles southwest of Springfield, Ill., and the centre of the number of farms was 110 miles east by south from St. Louis, in Wayne County, Ill., not far from the Louisiana Purchase border.

Louisiana Purchase Exposition, The, or Universal Exposition, held at Saint Louis,

LOUISIANA PURCHASE EXPOSITION

Mo., in 1904, opening 30 April; one of the greatest exhibitions the world has ever known; 42 States and 53 foreign governments having exhibits. The various States appropriated \$3,000,000 more for this exposition than for the Chicago World's Fair, and the vast exhibit covers more ground than the Chicago, Paris and Buffalo expositions combined. The Government Building is one mile from the Grand Trianon of France, along a stately boulevard, between eight of the finest exhibit palaces ever built. The boulevard is crossed by three courts; the central court is 2,500 feet long and 600 wide. Between the palaces is a mile of lagoons and canals. The amusement street is a mile long. The Philippines cover 40 acres. The Agricultural Palace is 1,600 feet long and covers 20 acres. The dome of the Hall of Festivals is 200 feet high. In it is the largest organ in the world, 62 feet wide, 40 feet high, with 10,000 pipes. The intramural railroad is nine miles long and touches every point of interest in a site two miles long and one mile wide. In fact, the attractions at this exposition are so many and varied and the undertaking so enormous that no detailed description can be given. A volume of over 200 pages is required for the prize lists and regulations of the Live Stock Department alone. This department includes eight groups, and there are 15 of these great Exhibit Departments, including 141 groups and 801 classes. Large bodies of State commissioners in all the States, assisted by local committees in counties were engaged for over a year past in collecting the best specimens that liberal prizes could call forth. All known governments co-operated in this work, each intent upon making the best possible exhibit. The Exposition shows all the products, processes, inventions, discoveries and triumphs of art and industrial skill, and is a vast museum of human progress, human efforts, hopes and aspirations. Besides broadening the scope of each department so as to include a greater number of related groups and classes, this Exposition was the first to organize a distinct Educational Department and rank it in the post of honor at the head of the list. Here, for the first time, the educator is given opportunity to compare intelligently the educational systems, institutions, methods and work of the various European nations with those of the United States, which include the competitive exhibits of the public schools of all the States and cities. In the Social Economy Department is exhibited the most complete and thorough illustration of the new Science of Humanity yet attempted, embracing all the enormous advances in the past ten years along this line by every government and city of Europe and America; showing state regulations of industry and labor, industrial organization of workers, methods of industrial remuneration, co-operative institutions, the housing of the working classes, liquor regulations and general betterment movements. Independent of this department, but related to it as an "outside exhibit" there is a great "Model City" in which the leading cities of Europe and America have displays illustrating their municipal utilities, economies and betterments—displays full of interest and edification for the urban taxpayers and home owners of America. The Physical Culture Department, equipped with a gymnasium and athletic field, race track and an immense amphitheatre, and aided by the counsels and active co-

operation of the leading athletic associations of the world, conduct a protracted series of athletic events lasting from 14 May to 24 November, at which a long list of splendid prizes and championships will be competed for in intercollegiate, interscholastic and international contests, embracing all sorts of games, feats and sports. Among these will be the great Olympic games under the direction of the International Olympic Committee; contests of historic and worldwide interest, enlisting the world's most famous athletes and champions. The still exhibits of this department will include everything illustrative of physical culture and its methods; gymnastic trophies and gymnastic equipments for schools and associations. Among other features are the International Press Parliament, the International Congress of Jurists and the World Congress of Arts and Sciences, in the discussions of which the most distinguished professors, publicists and teachers of the world were invited. The deliberations illuminate every branch of art, science, and education, economics, politics, philosophy, technology, sociology, etc., involved in the comprehensive scope of the exhibits. Here will also be assembled the world's first fleet of air-ships and flying machines, in competition for a prize of \$100,000.

Each of the 15 departments in the great exhibition outgrew all plans and anticipation; and the result is a much vaster display than was thought possible even in this advanced age. Additional areas were necessarily allotted to the great palaces of Art, of Liberal Arts, of Manufactures, of Varied Industries, of Machinery, of Electricity, of Transportation, of Agriculture, of Horticulture, of Fish, Game and Forestry, and of Mines and Metallurgy. Besides the Exposition Company's cash fund of \$15,000,000, there has been spent \$1,650,000 by the United States Government on its own separate exhibits; over \$6,000,000 by foreign governments; \$6,500,000 by the several States on their exhibits, and immense sums by cities, associations, fraternities, corporations and individual exhibitors.

During the last 50 years each of the recognized Universal Expositions has surpassed its immediate predecessor. Each was an epitome of the new ideas, new discoveries, new achievements of a new period in the world's progress, and as the art of organizing and equipping Expositions progressed, and the world's appreciation of their value increased, larger endowments were obtained for them, and choicer and more comprehensive exhibits became available from all parts of the world. Governments, scientific societies and art organizations were everywhere accumulating finer specimens in their museums, and becoming prepared to make better and better contributions to the treasures of a World's Fair exhibit, thus greatly widening the Exposition's choice of articles. By this natural process the Louisiana Purchase Exposition came into possession of better opportunities and advantages, and far ampler resources than any of its predecessors. In every field of improvement, social, industrial, or intellectual, it gathered the priceless products of the prolific seeds its predecessors planted. For the first time in the history of expositions, foreign governments actively helped to collect for the exhibition the finest productions of every clime, and the most excellent achievements of mankind, in arts and crafts and in all lines of social improvement. The ar-

LOUISIANA STATE UNIVERSITY — LOUISVILLE

rangement of exhibit plans and the preparations were under the direction of first honor graduates in Exposition science—men identified with Exposition work at home and abroad for the last 30 years. The knowledge and inspiration diffused abroad from every great exposition have stimulated and guided men to so many new discoveries and the invention of so many new industrial utilities, to say nothing of what has been done for the elevation of public ideals in morals and matters of taste, that the world is now, more than ever before, sensible of its indebtedness to their unique educative influence. Instead of being the last, the Exposition of Saint Louis will merely fix the higher standard and afford the better model for other Universal Expositions that will follow in succeeding decades, so long as the Promethean spirit impels men to emulate the gods as benefactors of mankind. The periodic market "fairs" of earlier centuries were the natural outgrowth of economic conditions under a ruder civilization and a cruder industrial development. Such "fairs" still survive under similar conditions in several countries and some have risen to great importance as promoters of trade. As advancing civilization with its modern appliances and modern industrial organization has superseded the market fair with better traffic facilities, their other social utilities have been preserved in competitive exhibitions, offering prizes for the best productions. The noted effect of these local competitive exhibitions in arousing emulation and directing attention to better models and higher standards of industrial effort led to the National Expositions which the great Napoleon inaugurated in France more than 100 years ago, the evolution of which has given us the constantly progressing series of World's Fairs that have stimulated and guided the geniuses of all nations through the last five decades of the 19th century.

DAVID R. FRANCIS,

Pres. of the Louisiana Purchase Exposition.

Louisiana State University and Agricultural and Mechanical College, a State educational institution at Baton Rouge, La. In 1855 a State school was founded under the name of the State Seminary of Learning, and was opened in 1860 with W. T. Sherman (later General Sherman) as superintendent. In 1861-5 the school was suspended on account of the war. In 1874 an agricultural college was established and temporarily located at New Orleans; in 1877 it was merged with the college at Baton Rouge and the university chartered under its present name. The courses offered are the Latin-scientific, literary, general science, mechanical and civil engineering, agriculture, and commerce; in the agricultural department a special course of 5 years is given on the cultivation and manufacture of sugar. There are three experiment stations connected with the University, one at New Orleans, one at Baton Rouge, and the third at Calhoun. Military drill is also a part of the curriculum. In 1903, the total income, including State and Federal appropriations, amounted to \$55,500; the number of students was 400, of professors and instructors, 27; and the library numbered 23,000 volumes.

Louisville, loo'-is vil or loo-i-vil, Ky., the capital of the County of Jefferson, and the principal city of the State of Kentucky, is situated opposite to the falls of the Ohio River, on the

Southern shore of the river, on the Louisville & Nashville, the Southern, the Chesapeake & Ohio, the Baltimore & Ohio Southwestern, the Pennsylvania, and other railroads.

Falls of the Ohio.—The falls of the Ohio River are caused by a ledge of Devonian rocks, rich in corals and other fossils, which were lifted from the bottom of the Silurian Sea, in which they were formed, and left here thousands of feet above their place of formation. In ancient geological times this wall of rock, in the form of an anticlinal axis, dammed up the water 25 feet and formed a lake a mile wide and several miles in length, above the dam, while the water below rushed down the other side of the axis, at the rate of a dozen miles an hour, until it was lost in a seething whirlpool below. When the river was low, it was dangerous to attempt to conduct a boat over these falls but when it was high, on account of the narrowness of the stream below and its width in the lake above, the excess of water filled the narrower stream below to a level with the wider one above and vessels passed over the falls as if they had not been there. In 1830 a canal two miles long was finished around the falls, on the Kentucky side, and on the 5th day of December the steamboat *Uncas* passed through it. The canal has since been enlarged and improved so as to meet the wants of the largest boats and is always used in going over the falls in low water. When the river is high, boats go over the falls and do not have to use the canal.

Site of Louisville.—The natural beauty of the falls of the Ohio was such that they could hardly fail to attract the attention of the intelligent eye which looked upon them. A dense forest with a very great variety of growth covered the country for miles around and the huge sycamores and cottonwoods, growing down to the water's edge, cast their shadows into the stream, not yet polluted by the waste of cultivated lands, and imaged another forest there. Crystal ponds scattered through the forest and verdant islands in the river added beauty and variety to the landscape. When Capt. Thomas Hutchins, of the British Engineers, saw the falls in 1766 he was so delighted with their natural beauty that he drew a picture of them which appeared in his 'Topographical Description of Virginia,' published at London in 1778. It was a very pretty picture then, is now, and always will be.

Plan of Louisville.—The plan of Louisville as originally laid out by John Corbly, in the spring of 1779, consisted of one range of streets parallel with the river and another range cutting them at right angles. The streets parallel with the river and running east and west bore names such as Water, Main, Market, and Jefferson, while the cross streets were known by numbers, such as One, Two, Three, etc. This plan was adhered to until additions to the original boundary made it necessary or gave an excuse for laying out new streets differently. In some of the additions the streets now run in all directions. Broadway as originally laid out, is 120 feet wide; Main, Market, and Jefferson, each 90 feet, and the other streets with a few unimportant exceptions 60 feet in width. In 1813 the paving of streets began. Previous to this time they were mud holes in winter and dirt-piles in summer. That part of Main Street

LOUISVILLE

from Third to Sixth was paved after the McAdam style. There are now in the city 176 miles of streets and as many miles of alleys paved with vitrified brick, asphalt, granite, or boulders, and a few with broken stone after the McAdam fashion.

Original Area of Louisville.—The original tract of land given to Louisville for a site by the Legislature of Virginia contained 1,000 acres. The land cost the State of Virginia nothing because it was confiscated from Dr. John Connolly, an adherent of the British during the War of Independence. The Legislature simply took the land from Connolly and gave it to Louisville. The city has since added many other tracts of land to the original until its external boundary now embraces 20½ square miles or 13,120 acres. In other words, Louisville, in a century and a quarter, has increased her original landed estate thirteen fold.

Dwelling-houses.—The first dwelling-houses built in Louisville were 16 by 20 log cabins with board roof and puncheon floor where there was any floor at all, but in many instances the native earth was the floor. The furniture was as plain as the houses and consisted principally of three-legged stools, a bed set on forks, a puncheon table and a few pewter or wooden spoons and plates. The rifle and scalping-knife were in every cabin and were the most costly and useful articles of the household. 'Squire Boone to gratify his own pride and improve the architecture of the town, secured some boards from a flat-boat which had brought immigrants, and built what he thought was a model house. The boards when used were water-soaked and when the moisture was dispelled by the sun the boards warped and twisted and sprang and turned in every direction. The house looked more like an angry porcupine than anything else and Boone was so disgusted with it that he left the town and built a log fort near where Shelbyville now stands. Capt. James Patton, more practical than Boone, found on his lot a huge sycamore that was hollow at the root and had an inside diameter of 12 feet. He utilized this hollow of the tree by building a log cabin against it and using it as a second room. The example of neither of these builders was followed by others but that of Michael La Cassange was. La Cassange was a Frenchman who secured the lot extending from Fifth to Bullitt Streets on the north side of Main. Here he erected a cottage in the style of Louis XIV., which was the only building pretending to any architecture that had been erected up to that time. The cottage was very showy and was the admiration of everybody and was especially liked for the large lot around it with its original forest trees, its shrubbery, its flowers, and its blue-grass, which La Cassange was careful to keep in the best order. The example of La Cassange was followed by others who soon began to build their dwelling-houses on large lots. The fashion has been kept up to our own times and it is rare to see a dwelling-house of any pretensions in Louisville without vacant ground around it, adorned with blue-grass and flowers and shrubbery and trees. On a summer's day one can, in some parts of the city walk for squares beneath the shade trees without the rays of the sun ever reaching him. Louisville is to-day distinguished for no one thing more than for the handsome and comfortable dwelling-houses of her citizens.

Business-houses.—The few rude dwellings were promptly followed by business houses equally rude if indeed the cabin used for a dwelling was not at the same time used for a shop or manufactory. Michael Humble so soon as the town was laid out erected a cabin near the fort at Main and Twelfth streets in which he made and mended guns and wrought out of metal the few things that were used. Joseph Cyrus had next to him a shop in which he made spinning-wheels and looms and everything that was carved out of wood. George Vensonier followed next with a tailor's shop and Henry Duncan with a hat-shop. A little further up town between Fifth and Sixth Streets, Daniel Brodhead had a store in which every kind of article used in the community was sold over the same board counter. These were humble beginnings at manufacturing but they continued to increase until now, according to the last census we have in Louisville 2,307 manufacturing establishments which invest every year in raw material \$41,016,391 and turn out manufactured articles valued at \$78,746,390. Our pioneers who were used to log-cabins for all purposes could not conceive of the necessity of the modern establishments if they were to behold them now in use, built of stone or brick, some covering whole squares and others ribbed with steel ascending into the clouds. The public buildings of the city have proportionately increased in dimension and style until they have become real ornaments. The court-house with its severe classic features, the city hall in its Gothic outlines, the custom-house in its blended styles of architecture, the sky-scrapers at the corner of Fourth and Main, and Main and Market, some of the great tobacco warehouses on Main street, and many of the manufacturing establishments and stores in different parts of the city are fine specimens of architecture adapted to the wants of business. The Galt House on the corner of Main and First is one of the finest hotels in the country and a new hostelry is being erected on Fourth Street which will ascend high into the air, and meet every want of the guest. A new jail is going up on the site of one of the early churches which will not only rob the prison of some of its horrors but will be an ornament to the city. The great department stores of Lewis, and Kaufman-Straus, and the New York Store, by furnishing the purchasers with every want have revived the fashion of pioneer times when every article which was for sale was sold under the same roof and made shopping a delight rather than a burden. The building of the American National Bank on the corner of Third and Main and that of the Louisville Trust Company at Fifth and Market are palatial business houses well suited to the purposes for which they were erected as well as ornaments to the city. It is possible that in the near future a business establishment will be erected on the southwest corner of Fourth and Jefferson that will equal if it does not surpass any yet built in the city.

Education.—Louisville as an educational centre is surpassed by but few cities. The University of Louisville with its law and medical departments, the Female High School, the Male High School, the Manual Training School and the Normal School, which are colleges of a high order, the 70 ward schools where children are trained free of cost for the higher depart-

LOUISVILLE

ments; the 9 medical colleges, the 2 theological seminaries, the 10 musical societies, the 25 Catholic institutions and the 9 educational associations in some of which the sciences are taught, all together offer advantages to students in almost every branch of knowledge. The Male High School, the Female High School, the Normal School and the Manual Training School, like the ward schools, are free institutions entirely supported by the city.

Charitable Institutions.—Hospitals, asylums and homes are almost as numerous in Louisville as schools. The Children's Free Hospital, where afflicted little ones are cared for, the Kentucky Institute for the Blind, where the sightless are taught to read and write, and 51 other institutions maintained for different purposes are prepared to meet almost every form of infirmity.

Churches.—There are 240 churches in Louisville, in which quite a variety of religions are cherished. The principal denominations are the Baptists, the Methodists, the Presbyterians, the Christians, the Episcopalians, the Catholics, and the Lutherans, but there are also Unitarians, Evangelists, Jews, and those who call themselves Non-Sectarians, Scientists, Seventh Day Adventists, Social Settlements, Spiritualists, Swedenborgians, United Brethren, and Theosophists. Some of the houses of worship like the Cathedral of the Assumption, the Warren Memorial, the Third Avenue Baptist and the Fourth Street Christian, are fine specimens of ecclesiastical architecture and capable of seating large congregations.

Banks.—There are 14 banks and banking institutions in Louisville with a combined capital of more than \$7,000,000 and a surplus of half as much more. If the four trust companies and the two title companies which necessarily do a good deal of banking business are added to the banks the capital and surplus of all combined will exceed \$12,000,000. The clearing of the banks for the year 1903 were \$529,241,195. The largest day's clearing amounted to \$2,867,000 on the 2d of January and the whole month of January showed the sum of \$50,706,431. Although the banking capital of the city cannot be said to be large the manner in which it is managed makes money almost always abundant. It is seldom that there is a stringency in the money market here which continues long or really amounts to inconvenience.

Finances.—The finances of Louisville will compare favorably with those of any other municipality in our country. According to the last published report of the assessor the assets of the city amounted to \$17,442,552 and the liabilities to \$8,836,129. If the liabilities therefore are deducted from the assets, a balance of \$8,616,422 will remain in favor of the city. Any bonds issued by the city are therefore what is known as gilt-edge, for if the city should fail to pay the interest or the principal its property can be sold for the payment. The city, moreover, besides owning this large amount of property in its own name has an income from taxes sufficient to meet all of its fixed liabilities and current obligations. The property within the city limits owned by individuals was assessed last year at \$132,000,000. The charter only allows 95 per cent of this amount to be considered in providing for current expenditures so that \$6,000,000 must be deducted from this

amount. We must also deduct 2½ per cent allowed for prompt payment of taxes. At the rate of \$1.86 tax, the sum of \$2,279,960 is raised from the balance, to be expended by the city during the year. This amount is distributed through the different departments of the city so as to provide for every liability and at the end of the year balances are generally left in different departments which are again distributed.

Largest Industries.—Six of the largest industries are whiskey, tobacco, cement, wagons, plows, and leather. More Bourbon whiskey is made in the Fifth District of Kentucky and handled in Louisville than in any other locality. The same may be said of leaf tobacco, and especially Burley leaf. Louisville is the largest market in the world for both of them. The quantity of hydraulic cement, and plows and wagons and leather made here is also enormous. The Board of Trade gives the following figures for 15 leading articles:

Agricultural Implements—pounds	40,000,000
Boots and shoes—cases	114,000
Dry Goods and Notions—cases	678,000
Flour—barrels	710,000
Furniture—pounds	30,000,000
Hardware—cases	985,000
Fine Leather—pounds	11,500,000
Saddlery—packages	255,000
Stoves and Stove castings—pounds.....	29,500,000
Soap—pounds	27,000,000
Manufactured Tobacco—pounds.....	52,000,000
White Lead and Paints—pounds.....	17,500,000
Wagons—pounds	35,900,000
Whiskey—barrels	365,000
Woolen Goods—pounds	15,000,000

Water.—The city owns the works which supply the citizens with water. They are valued at \$7,000,000, and a filter is now being added to the plant which, if successful in separating the mud and slime from the water, will make the works cost much more and be proportionately more valuable. The water is sold to citizens at a price much lower than they could obtain it in any other way.

Light.—The citizens have choice of three kinds of light furnished by different companies: these are electricity, artificial and natural gas. If they don't like either of them they can go back to the candles and lamps of their ancestors and do as they did before gas or electric light was invented. Natural gas is also much used for heat on account of its cleanliness and convenience.

Street Railways.—Street railways on which cars run by electricity ramify every part of the city and extend into the suburbs and to distant neighboring towns. No one need walk more than a square in any important part of the city unless he or she prefers to do so. The fare is only 5 cents for the longest distance in the city.

Steamboats.—Steamboats with headquarters at Louisville, in spite of the interference of railroads, are yet seen upon the Ohio and other Western waters, and afford the cheapest rates of freight. There are not, however, so many floating palaces upon the Western rivers as there were before railroads came into use, but there are yet a few which prevent the Ohio and its glories of old from being forgotten.

Board of Trade and Commercial Club.—There is a Board of Trade which keeps an eye on the interests of Louisville, and a Commercial Club which helps in the work. Any enterprise which looks to the interests of the city can be

LOUISVILLE

brought before either or both of these associations, and secure recognition and help if deemed worthy. Both of them have done valuable work in behalf of the city.

Newspapers.—There are five daily newspapers, three issued mornings and two evenings. Many weekly, semi-weekly, monthly, and periodical sheets are also issued. The *Courier-Journal* and *Herald* appear mornings and the *Times* and *Post* evenings.

Libraries.—The only public library in the city is the Louisville Public Library, successor to the Polytechnic Library, which was in turn successor to the Public Library of Kentucky. It is located on the upper floor of the fine building erected by it on Fourth Street and rented to Kaufman & Straus. It has some 50,000 or more volumes on its shelves, and is probably arranging at this time to consolidate with a new library which is to be established with money donated by Andrew Carnegie. Ample grounds have been secured on Third and Fourth streets where a suitable building is to be erected to house the books of the two institutions. The Southern Baptist Theological Seminary has a valuable library at the corner of Sixth and Broadway, and there are several other smaller collections which have something of a public character. There are also several large libraries in the city which belong to private citizens, and one of these, which has upon its shelves some 50,000 volumes, is probably the largest private collection in the country.

Sewers.—The sewerage system of Louisville is extensive, but it is undergoing a needed enlargement. The early engineers were disposed to do all the draining of the city toward "Paddy's Run," a probable survivor of the Ohio when its channel was farther to the south. This system, however, had to be abandoned when it was found that Paddy's Run would itself have to be drained as the city enlarged. The present sewerage system has more than 100 miles and terminates in the Ohio River, where it should have gone at first.

Fires.—The fire department of the city, under a chief, several assistants, and 247 firemen, has 17 steam-engines, three chemical engines, and all the necessary accompaniments of water-towers, hooks and ladders, etc. It is kept up at an annual expense to the city of about \$300,000, or at about \$1,215 for each one employed.

Police.—The police force of the city consists of 329 men, at an annual cost of about \$300,000, or about \$1,000 for each one employed. They are arranged after somewhat of a military grading, and consist of one chief with the rank of colonel, 1 assistant with the rank of major, 6 captains, 10 lieutenants, 10 sergeants, 16 corporals, 1 chief of detectives, 11 detectives, 1 special detective, 10 district detectives, 16 mounted men, 13 station-keepers, 10 wagoners, 213 patrolmen, and 1 secretary. The military character of the organization possibly comes from the ascertained fact that policemen have a good deal of fighting to do if they perform their duty.

Amusements.—Theatres are plentiful enough in Louisville to afford every citizen an opportunity of enjoying an evening's amusement. There are six of them, known by the following names: Avenue, Buckingham, Hopkins, McCauley's, Music Hall, and New Masonic.

Clubs.—There are more than 50 clubs in Louisville, either partaking of a literary, scientific, social, political, or some other character. Of these, the best known as a social organization is the Pendennis Club. The Filson Club, besides being social in its organization, is an historic and literary association which, since its beginning in 1884, has published a book every year made up of the original researches of its members into different branches of knowledge. It has now published 19 volumes, and its 20th volume is ready for the printer.

Parks.—The parks of Louisville have only been established in recent years. The present system was organized in 1891, and lands purchased for an eastern, a southern, and a western park. There was no use for a northern park, as the river was on that side. The western, known as Shawnee Park, consists of comparatively level land and embraces 170 acres; the eastern, named Cherokee Park, has 341 acres of gently rolling land cut into picturesque ravines by Beargrass Creek; and the southern, called Irquois Park, contains 718 acres of land, partly level but mostly hilly, with some of its eminences nearly 300 feet into the air. The park commissioners have recently purchased of the Dupont estate 18 acres known as Central Park, which, added to Baxter and Boone squares, will enlarge the intramural part of the system and meet the wants of those who cannot enjoy the suburban parks. The parks were named after the three Indian tribes who once asserted ownership over the land.

Health.—No city in our country enjoys better health than Louisville. The last report of the Health Office shows the death rate to be only 16 to the 1,000, and this has been the average for many years. Louisville was once an unhealthy city, when the dense forest was first cleared away and the rays of the sun admitted to the many ponds laden with decaying vegetable matter, but all these feeders of disease have long since been removed, and Louisville has become an exceptionally healthy city.

History.—In 1773 Dr. John Connolly located 2,000 acres of land, to which he was entitled for military service in the French and Indian war, on the south side of the Ohio River, immediately opposite the Falls. This land was surveyed for him by Capt. Thomas Bullitt, and on 10 Dec. 1773 Lord Dunmore executed a deed to him for it. Connolly then conveyed to Col. John Campbell one half of this land, and the two undertook to establish a town thereon, which Bullitt had laid out in the original survey. In 1774 they advertised lots for sale, but Indian disturbances arose and no one came to buy the lots. To the Indian troubles difficulties between Great Britain and her colonies succeeded, and increased until actual war was on between them. Connolly, as an adherent of England, was arrested by the patriots and thrown into prison, and Campbell fell into the hands of hostile Indians on his way from the Falls to Fort Pitt. Under such adverse conditions, with both proprietors in prison, the projected town at the Falls came to an end, and was probably forgotten by all except the unfortunate projectors.

In the spring of 1778, while Gen. George Rogers Clark was floating down the Ohio with his boats loaded with soldiers for the conquest of the Illinois country, he felt the necessity of some safe place in which he could discipline

LOUISVILLE

his raw recruits. When he reached an island in the midst of the Falls, afterward known as Corn Island, and saw the rapid waters dashing around it, he concluded that was the place he wanted, and that no deserter could make his escape from this island. Hence he landed on this island, on 27 May 1778, and immediately went to work to erect cabins for some 20 families of emigrants who came on his boats, and a block-house for his soldiers and supplies. He was opposed to these families coming on his boats, but was glad they had come, as he could leave the supplies he could not take with him in their care on the island and thus take with him every soldier. At the end of a month he thought his raw troops had been disciplined enough to make them reliable soldiers, and moved off with them down the river to Fort Massac, leaving the emigrants on the island, while the sun was in a full eclipse. The families thus left on the island became the founders of Louisville. So far as has been ascertained, they were about 50 in number, consisting of men, women, and children, and one negro. They remained on the island until the news came that Gen. Clark had conquered Kaskaskia, Vincennes, etc., and put an end to the Indian raids, that came from the British posts there to prey upon the helpless families of the Virginia border. Then, by order of Gen. Clark, they built a fort on the main shore and moved into it in time to celebrate their first Christmas in the wilderness with a dinner and a dance.

The interest attached to the subject among the descendants of these founders of Louisville, who are numerous, will justify the record of their names here for the preservation of their memories. So far as has been ascertained they were the following:

James Patton, his wife Mary, and their three daughters, Martha, Peggy and Mary.
 Richard Chenoweth, his wife Margaret, and their four children, Mildred, James, Jane and Thomas.
 John McManess, his wife Mary, and their three children, John, George, and James.
 John Twell, his wife Mary, and their three children, Ann, Minnie, and Jessie.
 William Faith, his wife Elizabeth, and their son John.
 Jacob Reager, his wife Elizabeth, and their three children, Sarah, Mariah and Henry.
 Edward Worthington, his wife Mary, his son Charles, and his two sisters, Mary (Mrs. James Graham) and Elizabeth (Mrs. Jacob Reager).
 James Graham, his wife Mary.
 John Doune, his wife Martha, their son John, and their colored man, Cato Watts.
 Isaac Kimbley, and his wife Mary.
 Joseph Hunter and his children Joseph, David, James, Martha (Mrs. John Doune) and Ann.
 Neal Dougherty, Samuel Perkins, John Sinclair, and Robert Tevis.

There may have been others whose names have not been preserved, and some of those named may not have been among the number. The list, however, is probably the best that can be made at this late day.

The above named persons who came to the Falls with Gen. Clark, and those who joined them as immigrants in the following spring, held a public meeting 10 April 1779, and appointed William Harrod, Richard Chenoweth, Edward Bulger, James Patton, Henry French, Marsham Brashears, and Samuel Moore trustees to lay out a town. These trustees met on the 17th of April 1779, and, having agreed upon a plan of the town, named it Louisville and

employed John Corbly, a surveyor, to lay it out and make a map of it. The plan of the town, as mapped out by Corbly, consisted of nothing but one street running along the bank of the river and 12 cross-streets cutting it at right angles. The numbering of the lots on Corbly's map can be likened to nothing but a puzzle of the most exasperating and unsolvable kind. The numbering is not consecutive and could not have been a reliable guide to the owners or anyone else.

On the first day of May, 1870, the legislature of Virginia, in response to a petition of those who had laid out the town, confirmed their act and appropriated 1,000 acres of the land which had been forfeited from Connolly, for the benefit of the town. The same act of the legislature appointed nine trustees to manage the affairs of the town. These trustees were John Todd, Stephen Trigg, George Slaughter, John Floyd, William Pope, George Merriwether, Andrew Hines, James Sullivan, and Marsham Brashears.

The city continued under the government of trustees, either appointed by the legislature of Virginia or Kentucky or elected by the people, from 1780 to 1828. It might be interesting to point out the acts of the trustees as city-builders during the period of 48 years, but space is not permitted here for such details. Room can only be allowed to sum up in a few words the result of their many acts.

Under their administration the city grew from a few log cabins, straggling along Main Street, which was nothing but a blazed dirt road through the forest, to comfortable and tasteful houses of brick and stone along paved streets. They hewed down the dense forests where the wild animal and the wilder savage dwelt, and drained the ponds which bred disease and death. They increased the population from only about 100 to 10,000, and the value of property in the city from nothing, to which they were reduced by their contest with Col. Campbell, to \$2,500,000. They were an easy-going board of old Virginians, who liked things to go well of their own will, but avoided no labor or danger when their duty required them to act. They had some queer rules for the government of their meetings, such as confiscating to their own use any liquor that a member might presume to bring a second time to a meeting, and passed some funny resolutions, such as the one which offered a premium for the scalps of rats; but no breath of scandal was ever whispered against them or their acts. They generally come into office poor and went out poorer. They held office at too early a day to make money out of it as modern officials do. They passed but few, if any, resolutions which yet stand for law, and left no public buildings that are yet among us to call them back to memory. They did one good thing, in laying off Main and Market and Jefferson streets 90 feet wide, but they did another which over-balanced this good act when they abandoned the public grounds Gen. Clark had mapped out and prevented the city from having parks at the beginning of its career.

By the charter of 1828 Louisville passed from the government of trustees to that of a mayor and 10 councilmen. The first election under the charter occurred 4 May 1828, when John C. Bucklin was elected mayor. At the

same election John M. Talbott, W. D. Payne, G. W. Merriwether, Richard Hall, James Harrison, J. McGillycuddy, John Warren, Elisha Applegate, Daniel McCallister, and Fred Turner were elected councilmen.

The elements of progress were in this charter, and Louisville soon began a prosperity such as she had never enjoyed before. One of the wisest provisions of this charter was in the following words:

The Mayor and councilmen shall have power and authority to establish one or more free schools in each ward in the city, and may receive donations of real and personal estate to erect necessary buildings and to provide the necessary revenue for their maintenance and may supply the funds from time to time by a tax on the ward where such school or schools shall be established.

This provision in the charter of 1828 is the foundation on which rests the free school system of the city and State. It was the first official act of any city on the subject, and we owe to it the many ward schools and the Female High School, the Male High School, and all the other free schools in the city.

The city has greatly prospered since the adoption of this charter, although the charter itself was not of long duration. It was superseded by the charter of 1851, which added to the governing power a board of 12 instead of 10 aldermen, and increased the number of councilmen to 24. It also established the school board, the waterworks, the board of health, the board of police, the board of fire, and the sinking fund. If it had done nothing but establish the sinking fund, by which specified parts of the revenue of the city, sufficient to pay the interest on the city's debts and to pay the principal when due, it would have done well. A third charter superseded the second in 1870, but the charter which added most to the departments of the city government was that of 1892. Under this charter a score of new departments or bureaus of the city were established. All of them report to the mayor and council, but it takes them all to conduct the affairs of the city. Some of them are necessary, but others might, in the opinion of wise men, be merged in those that are absolutely necessary and thus save considerable outlay for supernumerary office-holders.

Quite an effort is now being made to enlarge the sewerage of the city and to establish a new public library commensurate with the wants and the growth of the city. Two hundred and fifty thousand dollars have been contributed by Mr. Carnegie for a library building on a lot owned by the city. Such a sum, without any addition, should supply a building equal to all wants for many years to come. Louisville is certainly on the highway to metropolitan dimensions, and there is seemingly nothing in the way to arrest her progress. She now occupies an area of more than 20 square miles, with a population of 230,000 within her walls and 50,000 more in her suburbs. With a noble river connecting her with all the waterways of the Mississippi Valley, and railroads making her's a part of the system of the whole country, her progress is assured to the goal of municipal greatness.

Population.—The first inhabitants of Louisville were some 20 families, numbering probably 50 persons and consisting of white men, women,

children and one negro, who came on the boats of General Clark as emigrants to Kentucky and landed on an island in the Ohio, in the midst of the Falls, 27 May 1778. They erected log cabins on the island, afterward known as Corn Island, and remained there until the fall of 1778, when, by the order of General Clark, who had conquered the Illinois country, they erected a fort on the mainland and moved into it. In the spring of 1779, joined by other immigrants, they laid out a town on the mainland and named it Louisville, in honor of Louis XVI., king of France, who was then helping the colonists in their rebellion against Great Britain. By the first of May 1780 these immigrants had increased possibly to 100, and were at work building log cabins so as to free themselves from the confinement of the fort. By 1790 they had probably increased to 350, and in 1800, when the United States census for the first time recorded the population, but did not give it accurately, they had increased to 600. The United States census in after decades gives the population as follows: (1810) 1,357; (1820) 4,012; (1830) 10,341; (1840) 21,210; (1850) 43,194; (1860) 68,933; (1870) 100,753; (1880) 123,758; (1890) 161,129; (1900) 204,731. The population on 1 Jan. 1904 was estimated at 228,550 in Caron's Directory, a conservative and reliable work, and including the suburbs and Jeffersonville and New Albany, which are only separated from Louisville by the river, the population now exceeds 275,000.

Consult: McMurtrie's 'Sketches' (1819); Casseday's 'Louisville' (1852); Johnston's 'Memorial History of Louisville' (1896).

R. T. DURRETT,
President of the Filson Club.

Louisville & Nashville Railroad. The Louisville & Nashville Railroad Company's main lines extend from Cincinnati, Ohio, to Atlanta, Ga., via Lexington, Knoxville, and Chattanooga; from Cincinnati to Memphis, Tenn., via Louisville and Guthrie; from St. Louis, Mo., to Pensacola, Fla., and to New Orleans, La., via Nashville, Birmingham, Montgomery and Mobile; and to intermediate cities.

The road was chartered on 5 March 1850, and the main line was opened to the public in November 1859. The company prospered, and from time to time other branches of the road were built and other systems absorbed, until at the close of the fiscal year ending 30 June 1904 the company operates 3,637 miles of railroad, in Illinois, Indiana, Kentucky, Tennessee, Alabama, Florida, Mississippi, and Louisiana. It also owns a majority of the capital stock or is joint owner or lessee of 2,407 miles more railroad lines, comprised in the following roads: Nashville, Chattanooga & St. Louis Railway, the Birmingham Southern Railroad, the Georgia Railroad and its dependencies, the Atlanta, Knoxville & Northern Railway, and the Chicago, Indianapolis & Louisville Railway. If to this mileage be added that of 41 miles of roads operated by the Louisville & Nashville Railroad, but whose earnings are not included in the earnings of the last named railroad, and 247 miles of lines owned but not operated by the Louisville & Nashville Railroad, the grand total of mileage for that railroad system amounts to 6,356 miles.

LOUNSBURY—LOURDES

Some of the notable extensions of its systems made by the Louisville & Nashville Railroad in recent years include its acquisition of the lines of the Atlanta, Knoxville & Northern Railway (whose lines extend from Marietta, Ga., to Knoxville, Tenn., and from Blue Ridge, Ga., to Murphy, N. C.), which, being connected by an extension built from Knoxville to Saxton, Ky., gave the Louisville & Nashville Railroad a direct line from Cincinnati to Atlanta; the joint purchase of the 'Monon Route' by this road and the Southern Railway Company on 20 May 1902—being accomplished by acquisition of 51 per cent of the capital stock of the Chicago, Indianapolis & Louisville Railway Company (for joint account, the purchasing roads making payment in joint 4 per cent bonds at the price of 90 per cent of par value for the preferred and 78 per cent of par value for the common shares); and the joint acquisition by the Louisville & Nashville Railroad Company and the Atlantic Coast Line Railroad Company of the Georgia Railroad and its dependencies, these roads having taken over the historic lease of William M. Wadley, bearing date of 7 May 1881.

But the Louisville & Nashville system itself passed under the control of the Atlantic Coast Line Railroad Company on 1 Nov. 1902, the latter corporation purchasing slightly more than half the capital stock for \$30,600,000.

The capital stock of the Louisville & Nashville Railroad Company is \$60,000,000, of which \$59,916,200 is outstanding. But under its charter the company may increase its capital stock to an amount that shall be equivalent to the full cost of the railroad and its branches. This cost, including the property itself, the real estate and lands, and the improvements and betterments, but exclusive of all amounts outstanding to the credit of the company, supplies, revenue from rentals, etc., on 1 July 1904 amounted to \$138,807,865.36. On the same date the funded debt represented a total of \$113,342,500.

The rolling stock of the Louisville & Nashville road on 30 June 1904 consisted of 679 locomotives; 353 passenger cars; 146 baggage cars, express cars and mail cars; 30,905 freight cars of various kinds; and 779 cars used in the service of the road.

For the year ending 30 June, 1904, the road showed gross earnings of \$36,943,792.73 and total expenses of \$25,141,548.27, making the net earnings \$11,802,244.46 and the total net income (including income from other sources) \$13,437,398.64. From this income were paid taxes, interest on funded debt, sinking funds, dividends, etc., to the amount of \$9,749,227.16, leaving a balance surplus for the year of \$3,688,171.18. The dividends included in the above payment amounted to \$3,265,931.30. This amount, placed to the credit of the profit and loss account, brings the balance to the credit of that account to the figure of \$11,684,424.34. The dividend rate was increased in February 1905 to three per cent, semi-annually.

During the year ending 30 June 1904 the company operated an average total of 3,618 miles of railroad, allowing a total of 6,535,900 passenger train miles, 13,903,656 freight train miles, and 879,037 mixed train miles. A total of 8,647,469 passengers were carried a total of

314,681,892 miles; 21,429,278 tons of freight were moved 3,460,354,603 miles. The gross earnings of the road per mile were \$10,210.57; the operating expenses per mile were \$6,948.65, leaving the net earnings per mile of railroad at \$3,261.92—the ratio of expenses to earnings being 68.05 per cent.

The Louisville & Nashville Railroad Company owns but does not operate the Yellow River Railroad of Florida, a short line of less than 30 miles, operated independently. It also leases or operates the following roads, whose earnings are not included in the income account of the lessee company: The Eastern Railroad, of Alabama, about 20 miles of lines; the Elkton & Guthrie Railroad, of Kentucky, about 11 miles of lines; and the Glasgow Railroad, of Kentucky, about 10 miles of lines.

Lounsbury, lownz'ber-i, **Thomas Raynesford**, American scholar: b. Ovid, N. Y., 1 Jan. 1838. He was graduated at Yale in 1859; in 1862 he enlisted as a volunteer in the Union army and served as 1st lieutenant of the 126th New York Volunteers. He was mustered out at the close of the war, and, after private tutoring for three years, became in 1871 professor of English in the Sheffield Scientific School of Yale University. He retired from active service in June 1906. He has edited Chaucer's 'House of Fame' and 'Parlement of Foules,' and is the author of 'History of the English Language' (1879); 'James Fenimore Cooper' in 'American Men of Letters' series (1883); 'Studies in Chaucer, his Life and Writings' (1892); 'Shakespeare as a Dramatic Artist' (1901); 'Shakespeare and Voltaire' (1902).

Lourdes, loord, France, town, in the department of Hautes-Pyrénées; on the Gave de Pau; about 85 miles southeast of Bayonne. It is situated where seven mountain passes lead to favorite resorts in the Pyrenees. Nearby are valuable marble and slate quarries. Formerly Lourdes was famed for its chocolate and its fortified castle, which was considered impregnable in the days before the invention of firearms. Lourdes was then called the 'key of the Pyrenees.' In the 18th century the castle was converted into a prison and became the Bastille of the Mountains. In the year 1858 Lourdes acquired new fame. A little peasant girl, about 14 years of age, named Marie-Bernarde Soubirous (better known as 'Bernadette') reported to her parents, on 11 Feb. 1858, that she had seen a most beautiful lady in a grotto at the rocks of Massabielle, a part of the town. The pastor of the Roman Catholic church at Lourdes, and the priests of the neighboring towns, also the bishop of Tarbes, the diocese in which Lourdes is located, all gave the matter no attention until people from a distance began to visit Lourdes, and miracles were reported, and scientists had begun observations and investigations. On 25 Feb. 1858 a spring appeared in a place where no water had been seen before. It was some days before the child gave a name to the lady; it was then Virgin Mary, under the name L'Immaculée Conception. The matter was then investigated by the ecclesiastical authorities and pronounced a genuine apparition, and many cures were said to be miraculous. The place has become noted for the large number of visitors, fully 300,000 annually. A magnificent church has been erected

at the grotto, the flags of all nations show that pilgrims from the countries of the whole world have visited the place. Again and again have scientists investigated and reported for and against the miraculous appearance of the spring and its efficacy as a cure for diseases. There has never been imputed any wrong motive to "Bernadette" or her parents. Pop. (1901) 8,708.

Consult: Lasserre, 'History of Lourdes'; Boissaire, 'Lourdes, Histoire medicale' (1891); 'Les Annales de Notre Dame de Lourdes'; Saint John, 'The Blessed Virgin in the 19th Century' (1902).

Louse, the name of small parasitic insects of a family (*Pediculidæ*) of doubtful affinities, but usually considered to be *Hemiptera*, much degraded through long-continued parasitism. The lice are all of small size, have soft, much flattened bodies with thin integument, the abdomen enlarged, the thorax indistinctly segmented, and without the slightest trace of wings, and the short legs terminated with strongly hooked, stout claws. The mouth-parts are adapted for sucking, but the homology of the several organs with those of the *Hemiptera* is still doubtful. There is a short proboscis provided with hooks, from the centre of which, when fixed in the skin of the host, there protrudes an extremely delicate tube. The head is also provided with a pair of short, three or five-jointed antennæ and small simple eyes. Probably on account of their disgusting habits the lice have been but little studied, and beyond the fact of their parasitism very little is known of their habits. They feed exclusively upon blood, which is secured by wounding the host's skin, fixing the proboscis by means of its hooks, and inserting the delicate tube above mentioned in the wound. A suction-bulb in the head propels the blood through the long writhing œsophagus into the bilobed stomach. Lice never leave their host except to pass to another, and the eggs, as well as all stages of the young, are found with the adult. Only six genera and less than fifty species have been described, but it is probable that a very great many others remain undiscovered. They are found on mammals exclusively, each species of mammal commonly harboring a peculiar species of louse. Man is more richly endowed, having three species: the head-louse (*Pediculus capitis*), the body-louse (*P. corporis*), and the crab-louse (q.v.). The two first mentioned are very closely alike and are said to vary according to the different races of men which they infest. Human lice are of course associated with filth, and are found only upon neglected children and persons of uncleanly habits. A very remarkable louse is found on the seal, and is consequently aquatic. The bird-lice (q.v.) or *Mallophaga* are entirely distinct from the true lice.

Consult: Schiödte, *Annals Nat. Hist.*, 1866; Piaget, 'Les Pediculines'; Giebel and Nitzsch, 'Insecta Epizoica'; and various recent papers on *Mallophaga* by Kellogg in the 'Proceedings U. S. National Museum.'

Lousewort, any of various weeds of the genus *Pedicularis*, of the broom-rape (q.v.) family, which contains low, usually pubescent, perennial herbs, with chiefly pinnatifid leaves, and a spike of purplish, two-lipped flowers. The species are few, and the most common is *P. canadensis*, sometimes called wood-betony.

Louvain, loo-vân (Flemish, *Leuven*; German, *Löwen*), Belgium, city in the province of Brabant; on the Dyle, 15 miles east by north of Brussels. It was surrounded by earthen ramparts, which have been converted into pleasant promenades, which form almost a perfect circle, diameter nearly two miles. There are many buildings of historical interest, among which are the Hôtel de Ville, one of the richest and most beautiful Gothic buildings in the world, elaborately and exquisitely decorated in every part of its exterior by sculptures of subjects taken, for the most part, from the Old Testament (restored 1842, injured by lightning 1890); the collegiate church of St. Peter, almost opposite the Hôtel de Ville, built at the end of the 14th century, an edifice of vast extent, and rich in works of art, particularly a fine 'Holy Family' by Matsys. The educational institutions are numerous, among them are the university, which has a number of American students who are studying for the priesthood, a college, an academy of fine arts, two normal schools for the training of teachers, several secondary and elementary schools. There are hospitals, homes for orphans, and other charitable institutions. It has a number of manufactories, the most important of which are the tanneries. For a general trade the town is well situated, having ample communication both by railroad and the Louvain canal. The name of Louvain first appears in history about the end of the 9th century. It was surrounded with walls in 1115, but was afterward much enlarged. The dukes of Brabant inhabited the castle till the 13th century. At the beginning of the 14th century Louvain was the capital of Brabant, contained 200,000 inhabitants, and had an extensive and flourishing trade in the manufacture of broadcloth and all kinds of woollens. The populace, jealous of the privileges of the nobles, revolted in 1382, and being overcome by Duke Wenceslaus and subjected to severe oppression, emigrated in great numbers to England, and thus caused the decay of the town. Pop. (1901) 43,308.

L'Ouverture, Toussaint. See TOUSSAINT L'OUVERTURE.

Louvois, François Michel Le Tellier, frân-swâ mê-shêl lê têt-ê-â loo-vwâ, MARQUIS or, minister of war to Louis XIV.: b. Paris January 1639; d. 16 July 1691. He was early made a royal councillor through the influence of his father. After 1666 he had the whole management of the ministry of war, and soon exercised a despotic control over his master the king, and over the army. His extensive knowledge, his decision, activity, industry, and talents, rendered him an able minister; but he was too lavish of the blood and treasure of France. Justly appreciated, Louvois must be considered as the evil genius of the showy but disastrous reign of Louis XIV. The war of 1672 against Holland was begun at his instigation. The victories of Turin in 1674 and 1675 were gained by a disobedience of the orders of the minister of war; but the desolation of the Palatinate was commanded by him. On the death of Colbert (1683), of whom he had been the enemy, his influence became still greater, and one of its most fatal effects was the revocation of the Edict of Nantes (1685), the *dragonnades*, and the consequent flight of so many peaceful and industrious Calvinists. The encroachments of France had

LOUVRE—LOVEJOY

united the European powers in the League of Augsburg. Louvois would have the king commence operations against the allies at once, but the growing influence of Mme. De Maintenon was sufficient to prevent this. In 1688, however, the French forces took Philippsburg on the Rhine, and on the order of Louvois, the Palatinate was reduced to a wilderness in midwinter (1689). Louvois' organization of the army lasted till the Empire; but he also undid the work of Colbert, and destroyed the commerce of France.

Louvre, loovr, **The**, an old royal palace at Paris, on the north bank of the Seine, a splendid quadrangular edifice, with a court in the centre, completed by Napoleon. The origin of its name, and the time of the erection of the oldest part of it, are unknown. It is only known that Philip Augustus, in 1214, built a fort and a state prison in this place; that Charles V., during the years 1364-80, added some embellishments to the building, and brought his library and his treasury thither. Francis I. erected that part of the palace which is now called the old Louvre. Henry IV. laid the foundation of the splendid gallery which connects the Louvre on the south side with the Tuileries; Louis XIII. erected the centre; and Louis XIV., according to the plan of the physician Perrault, the elegant façade toward the east, together with the colonnade of the Louvre, which is still the most perfect work of architecture in France. At a later period Louis XIV. chose the palace built by him at Versailles for his residence. After Napoleon had taken possession of the Tuileries he began a second gallery, opposite to the former, by which the two palaces would have been made to form a great whole, with a large quadrangular court in the centre; only 600 feet of it were completed at the time of his abdication, and it remained uncompleted till 1857, when the work, in an improved and extended form, was finished. It was greatly injured by the communists in May 1871, the Richelieu pavilion, containing the magnificent library, being burned. The Louvre was set apart by the Convention as a museum for the national collections in science and art. It contains the museums of paintings, drawings, engravings, bronze antiques, sculptures, ancient and modern, together with special collections of antiquities, and an ethnographical collection.

Lovage, an umbelliferous plant of the genus *Levisticum*, native to the south of Europe, sometimes cultivated in gardens, and notwithstanding its strong and peculiar odor, used as a salad plant. Its roots and seeds are aromatic, acrid, and stimulant, and a liquor called "lovage" is made from them. The Scottish lovage is a native of the sea-coasts and has become naturalized in maritime New England. It is eaten, both raw and boiled, by the Shetlanders. The flavor is aromatic, but acrid and very nauseous to those unaccustomed to it.

Lovat, lo'vat, **Simon Fraser**, 12th LORD, Scottish chieftain: b. 1667; d. London 9 April 1747. He was educated at King's College, Aberdeen, and in 1699, on the death of his father, assumed the title of Lord Lovat, to which on the death of the 10th Lord Lovat his father had acquired a disputed claim. In consequence of proceedings taken in 1698 against him and his clan, in which he was declared guilty of treason, he went to France. He afterward obtained a pardon, and returned to Scotland. Being sum-

moned before the High Court of Justiciary, 17 Feb. 1701, for an outrage done to the Dowager Lady Lovat, whom he married by violence, he failed to appear, and was outlawed. In 1715 he was asked by the Jacobites of his clan to espouse the cause of the Pretender, but inducing them to support the government he received in reward the estate and title of Lovat, the other claimant of which had been involved in the rebellion. In 1740 he was the first to sign the association for the support of the Pretender, and on the breaking-out of the rebellion, in 1745, sent his eldest son with a body of his clan to join the Pretender, while he remaining at home asserted his loyalty to the house of Brunswick. He was, nevertheless, found guilty of treason, and was executed on Tower Hill, in the eightieth year of his age. Consult Burton, 'Life of Simon, Lord Lovat' (1847).

Love, Alfred Henry, American woolen merchant and philanthropist: b. Philadelphia, Pa., 7 Sept. 1830. Since 1853 he has been in the woolen commission business in his native city. Since 1867 he has edited 'The Voice of Peace and the Peacemaker,' and 'Court of Arbitration,' a monthly, and in 1866 aided in organizing the Universal Peace Union. He contributed to periodicals many articles on reformatory subjects and made many addresses.

Love-apple. See TOMATO.

Love-bird, one of the very small parrots of the genus *Agapornis*, not larger than sparrows, which show extreme affection for one another, two or more sitting as close as possible to one another, and cooing and caressing in a manner most delightful to watch. They are common as cage-birds all over the world, are pretty in color and fond of being petted. They are to be treated and fed in the cage in the same way as canaries. The true love-birds are African, but dealers give the same name to various other diminutive tropical species of similar habits. See PARROTS and the books cited there.

Love, Court of. See COURT OF LOVE.

Love Feasts, religious meetings held quarterly by the Wesleyan and other sects. Love feasts are retained in avowed imitation of the ancient Agapæ. See AGAPE.

Love Lies a-Bleeding. See AMARANTHUS.

Love-dale, South Africa, an important educational and mission station about 40 miles west of King William's Town and 650 miles northeast of Cape Town. It was founded in 1841 and generously supported by the Free Church of Scotland. Besides a general education, it trains teachers for native schools, and gives technical instruction in printing, bookbinding, telegraphy, carpentering, and other useful arts and crafts; its success has been most creditable.

Lovejoy, Elijah Parish, American abolitionist: b. Albion, Maine, 9 Nov. 1802; d. Alton, Ill., 7 Nov. 1837. He was graduated at Waterville College in 1826, and at the Princeton Theological Seminary in 1833, and was ordained to the ministry, but soon after assumed the editorship of the *St. Louis Observer*, a Presbyterian paper of considerable influence. His utterances on the slavery question did not begin to appear in the *Observer* until he had been for some time in charge of its columns, and his first references to that subject were marked by mod-

LOVEJOY—LOVERING

eration. But, stirred by the lynching of a negro murderer by burning, he published an editorial which incensed the pro-slavery part of the community. Hostility was so violent that he removed the paper to Alton, Ill., where a mob threw his press into the river. He was presented with another by Alton friends, and 8 Sept. 1836 published the first issue of the *Alton Observer*. He soon took a bolder anti-slavery stand, and began to call for the organization of a State abolition society. Again, in August 1837, he was mobbed, his office wrecked, and the press destroyed, and when a new press was bought, the ruin was again repeated. The fourth press was set up in a warehouse under an armed guard; but during the night of 7 Nov. 1837 a score or two of men attacked the building, disregarded Lovejoy's warning, were fired upon, and one of the assailants was killed. An attempt was then made to set the warehouse on fire, and when Lovejoy was preparing to shoot the incendiary, he himself received a mortal gunshot wound. The mob then took possession of the place, and once more Lovejoy's press was destroyed. The whole country was excited by these events; public feeling was manifested in various ways; but the most significant effect of the tragedy was a more distinct arraying of forces for the 'irrepressible conflict' which had already begun. Consult: J. C. and Owen Lovejoy's 'Memoir' (1838); May, 'Some Recollections of Our Anti-slavery Conflict' (1869); Tanner (one of the defenders of the warehouse), 'The Martyrdom of Lovejoy' (1881); Garrison, 'William Lloyd Garrison' (1885); and Martyn, 'Wendell Phillips—the Agitator' (1890).

Lovejoy, Owen, American abolitionist: b. Albion, Maine, 1811; d. 1864. He was a brother of E. P. Lovejoy (q.v.); was educated at Bowdoin College; and in early life he removed to Alton, Ill. Entering the ministry of the Congregational Church, he preached and lectured against slavery with a power that roused his hearers and carried wide conviction. At Princeton, Ill., where he began a pastorate in 1838, he became conspicuous for the earnestness of his anti-slavery addresses, and for his persistence in holding anti-slavery meetings in defiance of legal and official prohibitions. In 1844 he was elected to the legislature, and resigned his pulpit. Elected to Congress in 1856, he participated in its most exciting debates until the time of his death. He was with his brother Elijah at Alton, Ill., 7 Nov. 1837, and was a witness of his tragic death.

Love'lace, Francis, American colonial governor: b. Hurley, Berkshire, England, about 1618; d. England about 1675. He was a younger son of the 1st Baron Lovelace and in 1668 succeeded Richard Nicolls as governor of New York. He oppressed the inhabitants by heavy taxation and became very unpopular. During his temporary absence from the town the Dutch fleet appeared in the harbor and the citizens speedily surrendered.

Lovelace, Richard, English lyrical poet: b. Woolwich, Kent, 1618; d. London 1658. He was educated at Oxford, entered the army and became a captain. He spent his fortune in support of the royal cause, and after entering into the French service, in 1648, returned to England, and was imprisoned until the king's death. His destitute condition at this time is in marked contrast to accounts of his handsome person and

splendid appearance earlier in life. He died in great poverty. His poems, which are light and elegant, were published in 1659 under the title of 'Lucasta.' The best known of his lyrics are 'To Althea, from Prison,' and 'To Lucasta, on Going to the Wars.' Lovelace, who for spirit and gallantry has been compared to Sir Philip Sidney, also wrote 'The Scholar,' a comedy; and 'The Soldier,' a tragedy.

Lov'ell, James, American patriot: b. Boston, Mass., 31 Oct. 1737; d. Windham, Maine, 14 July 1814. He was a son of John Lovell (q.v.), was graduated from Harvard in 1756 and taught in the Boston Latin School under his father in 1757-75. In 1771 he delivered the first anniversary oration on the so-called 'Boston Massacre.' He was imprisoned by General Gage and carried to Halifax, but was exchanged in November, 1776, and sat in the Continental Congress 1776-82. He was collector of the port of Boston, 1788-9, and its naval officer, 1790-1814.

Lovell, John, American educator: b. Boston, Mass., 16 June 1710; d. Halifax, N. S., 1778. He was graduated from Harvard in 1728. The next year he was appointed usher in the Boston Latin School and was its master from 1734 till the siege of Boston caused its suspension, 19 April 1775. He was a rigid disciplinarian, but nevertheless genial and popular. A loyalist in his sympathies he went to Halifax on the evacuation of Boston by the English troops.

Love'man, Robert, American poet: b. Cleveland, Ohio, 11 April 1864. He was graduated from the University of Alabama. He has been a frequent contributor to magazines, and his verse is marked by simplicity and earnestness. He has published 'Poems' in 1889, 1893, and 1897; and 'A Book of Verse' (1900).

Lov'er, Samuel, Irish painter, novelist and poet: b. Dublin 1797; d. Saint Helier's, Island of Jersey, 6 July 1868. He first devoted his attention to painting, and in 1828 became a member of the Royal Hibernian Academy of Art. He afterward wrote novels, which he illustrated himself, dramas, operettas, and songs which he set to music of his own. In 1844 he gave a series of public entertainments called Irish evenings, which he repeated in the United States and Canada in 1846. Among his works are: 'Legends and Stories of Ireland' (1832-4); 'Rory O'More' (1837); 'Songs and Ballads' (1839); 'Handy Andy' (1842); 'Treasure Trove' (1844). The 'Angels' Whisper'; 'Molly Bawn'; and the 'Low-backed Car' are among his most popular songs. His works in 6 vols. with introduction by O'Donohue, were issued in New York in 1900, and with introduction by Roche, in Boston, 1902.

Lov'ering, Joseph, American scientist: b. Boston 1813; d. Cambridge, Mass., 1892. He was a graduate from Harvard, where he became Hollis professor of natural philosophy and mathematics in 1838, and continued to hold the position till 1888, when he was made professor emeritus. From 1884 to 1888 he was director of the Jefferson Physical Laboratory and he was also connected with the Harvard Observatory.

Lovering, William C., American politician and cotton manufacturer: b. Rhode Island 1837. He was educated at the Cambridge High School. He is president of the Whittenton Manufacturing Company, Taunton, Mass., sat in the State Sen-

ate 1874-5 and has been a member of Congress as a Republican continuously from 1897.

Love's Labour's Lost, a comedy of Shakespeare's, supposedly his first dramatic production, written about 1588-9. While marked by immaturity, it has a sprightliness of wit and constancy of good nature which render it both interesting and pleasing. Its sources are not known but, so far as can be told, the plot is Shakespeare's. In 1597 the play was revised and presented at a court entertainment as being "corrected and augmented" by Shakespeare, showing the existence of an earlier version. On this occasion the name of Shakespeare for the first time appeared on the title-page of a play. The cuckoo song ("Spring") and the "Tu-whit, tu-who" song of the owl ("Winter") give the comedy a fine ending.

Low, I. A. Maurice, American journalist: b. London, England, 1860. He was educated at King's College, London, and in Austria, and since 1886 has been in charge of the Washington department of the *Boston Globe*. He is also the principal American correspondent of the *London Chronicle*. He has published 'The Supreme Surrender' (1901).

Low, Charles Rathbone, English historian and naval officer: b. Dublin, Ireland, 30 Oct. 1837. He went to sea in 1853 and has served in Asiatic and African waters. He is a fellow of the Royal Geographical Society and a lieutenant in the Indian navy, and has published 'Tales of Old Ocean' (1860); 'Land of the Sun' (1870); 'History of the British Navy' (1872); 'History of the Indian Navy' (1877); 'History of Maritime Discovery' (1899); 'Her Majesty's Navy' (1902); 'Britannia's Bulwarks' (1895); 'The Epic of Olympas' (1897); etc.

Low, Sampson, English publisher: b. London 1797; d. 1886. He became manager in 1837 of a trade journal styled 'The Publisher's Circular,' on which his 'British Catalogue' was afterward based. He established the publishing house of Sampson Low & Co., in 1848. His various compilations include: 'Index to Current Literature' (1859-60); 'Low's Literary Almanac' (1873); etc.

Low, Seth, American educator and administrator: b. Brooklyn, N. Y., 18 Jan. 1850. He was educated at the Brooklyn Polytechnic Institute and at Columbia, graduating from the latter in 1870. He then entered his father's tea and silk importing business as a clerk, and passing through all the intermediate grades, became a junior partner in the firm in 1875. In 1879 he and the other junior partners took full control of the business which was finally liquidated in 1888. He was early interested in public affairs, especially in charities, was prominent in the movement which resulted in abolishing the system of outdoor relief of Kings County, and was organizer and first president of the Bureau of Charities. He was also active in the Republican party, being president of the Young Republican Club in the Garfield campaign of 1880; and though he resigned the presidency remained an active member of this club, which soon began agitation for the non-partisan administration of city affairs. In 1881 he was nominated for mayor of Brooklyn on an independent ticket, and elected; after an efficient administra-

tion he was re-elected in 1883, serving another two years. His administrations were marked by reforms in the system of taxation, and in the public schools, but more especially by the introduction of the civil service system and non-partisan appointments in city affairs. In October 1889 he was offered the presidency of Columbia College (now Columbia University), which he accepted. While he was president, the undergraduate department was enlarged, the graduate schools and Barnard closely affiliated, the institution organized as a university, and the site changed. He also gave the university \$1,000,000 for the erection of a library building. He retained his interest in public affairs, was a member of the Rapid Transit Commission, and of the Greater New York Charter Commission, and an earnest advocate of consolidation; he was also twice a referee in labor troubles. In 1897 he was an independent candidate for Mayor of Greater New York and was defeated, though polling over 150,000 votes. In 1899 he was a member of the United States delegation to The Hague Peace Conference. In 1901 he was nominated for Mayor of Greater New York on a Fusion ticket, and was elected. His administration of the next two years led to a reduction of the taxes, sweeping reforms in the police department, and an enlargement of the public school system, and showed a strict adherence to the principles of business-like administration of public affairs which characterized his Brooklyn mayoralty. In 1903 he was again Fusion candidate for Mayor, but was defeated, a defeat generally attributed not to any serious mistakes or faults in his administration, but rather to party questions and complications.

Low, Will Hicock, American painter: b. Albany, N. Y., 31 May 1853. He learned painting at Paris under Gérôme and Carolus-Duran (1873-7), and since 1890 has been Academician of the National Academy of Design, and is one of the founders of the Society of American Artists. He is classed among the most active and versatile of living American artists and has been alike successful in decorative wall paintings, stained glass (at which he worked with John La Farge, q.v.), portrait and book illustration in black and white. His strength as a designer and colorist has been recognized by the public awards made to his work and by the demand for his services on the part of private and public patrons and connoisseurs. He has also had charge of life classes in the schools of Cooper Union, and the National Academy of Design. The following are some of his best known pictures: 'Portrait of Albani' (1877); 'Chloe' (1882); 'My Lady' (Lotus Club, New York); 'Aurora' (1894); 'Homage to Venus' (mural painting, Waldorf-Astoria, New York).

Low Church, a popular name given to a section of the Church of England whose opinions are opposed to those of the High Church party, and are especially hostile to ritualism and sacerdotalism.

Low Sunday, the first Sunday after Easter, so called to emphasize the contrast between the great feast of the Resurrection and the Sunday which ends the octave. In the Missal (q.v.) and the Breviary (q.v.) the name is "Dominica in Albis," because on this day the newly baptized wore their white robes for the last time. Mention is made of this custom in

the Breviary hymn used in the vespers of Low Sunday, "Ad regias Agni dapes." The name "Beloken Paschen," close of Easter, is used frequently in Holland; and "Quasimodo," the first word in the introit of the Mass for the day, is the common name for this day in Germany and France.

Lowe, Charles, English journalist and biographer: b. Balconnel, Forfarshire, Scotland. He was educated at the University of Edinburgh and on the Continent and was for 13 years *Times* correspondent at Berlin, returning to England in 1891. He has published two biographies of Bismarck: 'Bismarck's Table Talk'; 'Alexander III. of Russia'; 'King Edward VII.'; 'Our Greatest Soldiers'; etc.

Lowe, Sir Hudson, British general: b. Galway 28 July 1769; d. London 10 Jan. 1844. He entered the army at an early age; in 1813 was attached to the army of Blücher, and took part in the invasion of France in the early part of the following year. Appointed in 1815 to the command of the English troops which were to co-operate with the Austro-Sardinian army in Italy; on the fall of Napoleon he was appointed governor of St. Helena, and entrusted with the care of the ex-emperor. He returned to England in July 1821. He has been accused by the partisans of Napoleon for want of courtesy and for rigor and cruelty to his prisoner. It is, however, freely admitted that Napoleon and his suite made a system of exaggerating their grievances, and even sedulously tried to provoke them, with a view to exciting sympathy in Europe. Many of the grievances were puerile, as that Sir Hudson would not give Napoleon the title of emperor, which England had never recognized, and which he was forbidden by his government to use. Consult: Forsyth, 'Captivity of Napoleon at Saint Helena from Letters and Journals of Sir Hudson Lowe' (1853); Seaton, 'Sir Hudson Lowe and Napoleon' (1898); Lord Rosebery, 'Napoleon, the Last Phase' (1900).

Lowe, John, American rear-admiral: b. Liverpool, England, 11 Dec. 1838. He was educated in his native city and Columbus, Ohio, and entered the American navy in 1861. He served through the Civil War and accompanied the Greely Relief Expedition in 1884. He was the first naval officer of any nation to serve in a submarine torpedo-boat. This he did in 1898. He was promoted rear-admiral 11 Dec. 1900, and retired the same day. Since his retirement he has participated in an experiment with a submarine torpedo-boat, remaining submerged for 15 hours.

Lowe, Martha Ann Perry, American verse writer: b. Keene, N. H., 1829; d. Somerville, Mass., 1902. She published: 'The Olive and the Pine' (1859); 'Love in Spain, and Other Poems' (1867); 'The Story of Chief Joseph' (1881); 'Bessie Gray'; etc.

Lowe, Robert, Viscount Sherbrooke, English politician: b. Bingham, Nottinghamshire, 4 Dec. 1811; d. London 27 July 1892. He was educated at Winchester College and at University College, Oxford, and directly upon his admission to the bar in 1842 went to Australia, where he quickly attained prominence in political affairs. In 1843 he became a member of the Legislative Council of New South Wales, and

made himself famous by his opposition to the land monopoly, as well as by the part he performed in the development of education and the regulation of finance. He also made effectual protest against the English practice of transporting convicts to Australia. Meanwhile he was not neglectful of his private affairs, but acquired great wealth, and returned to England in 1850. Two years later he was elected to Parliament for Kidderminster, and accepted the position of joint secretary of the board of control, and in 1859, under Palmerston, was placed practically at the head of educational affairs. In consequence of a mistaken vote of censure by the House of Commons in 1864 he resigned his office, but only to participate with ability more marked than before in the proceedings of that body. The rejection of the Whig Reform Bill in 1866 was considered to have been largely due to his powerful speeches against it. As one of the Adullamites (q.v.) he received overtures from the government of Lord Derby, but although he called himself an outcast from the Liberal party he refused to leave it. In 1867 he made a number of speeches designed to justify his opposition to extension of the suffrage. His strong support of the resolutions for disestablishment of the Irish Church, in 1868, restored him to favor in the Liberal party, and in December of that year he became chancellor of the exchequer under Gladstone, giving up that office in 1873 to accept the post of home secretary, in which, however, his tenure was brief. His reforms as chancellor of the exchequer related especially to reduction of sugar duties, the replacing of assessed taxes by license duties, and like readjustments. After the fall of the Gladstone ministry in 1874 Lowe took comparatively little part in public affairs. He was raised to the peerage as Viscount Sherbrooke in 1880. Consult: Parkes, 'Fifty Years of Australian History' (1892); Martin, 'Life of Lord Sherbrooke' (1893); Hogan, 'Robert Lowe, Viscount Sherbrooke' (1893); also Hansard, 'Parliamentary Debates.'

Lowe, Thaddeus S. C., American inventor and scientist: b. Jefferson, N. H., 20 Aug. 1832. He constructed balloons in 1856 and 1858-9 in order to study atmospheric phenomena, and during the Civil War was chief of the aeronautic corps. He devised a system of signaling in 1862, and valuable instruments for atmospheric investigation, etc., constructed and operated the largest aerostat ever built, invented a compression ice machine and made the first artificial ice in the United States (1865); and established the Lowe Observatory in the Sierra Madre Mountains, Cal.

Lowell, 15th el, Abbott Lawrence, American educator and author: b. Boston 13 Dec. 1856. He was graduated from Harvard in 1877, from the law school of the university in 1880, was a legal practitioner in Boston in 1880-97, and from 1897 to 1899 was a lecturer at Harvard. In 1900 he was appointed there to the chair of the science of government. Among his works are: 'Essays on Government' (1889); 'Governments and Parties in Continental Europe' (1896), the only work of the sort in English, and a most careful and valuable explanation of the governmental machinery of European states; and 'Colonial Civil Service' (1900).

LOWELL

Lowell, Charles, American clergyman: b. Boston 15 Aug. 1782; d. Cambridge 20 Jan. 1861. He was a son of John Lowell (1743-1802). He was graduated from Harvard in 1800, studied theology at Edinburgh, Scotland, and from 1 Jan. 1806 until his death was pastor of the West (Unitarian) Church of Boston. His ill-health caused his absence in Europe and the East (1837-40), and in his later years his place in the pulpit was largely taken by his colleague, Cyrus A. Bartol (q.v.). He was an able orator and of strong anti-slavery views. A founder and member of the Society of Northern Antiquarians of Copenhagen, he was also secretary of the Massachusetts Historical Society and a corresponding member of the Archæological Society of Athens. Among his published writings are: 'Meditations for the Afflicted, Sick, and Dying'; 'Devotional Exercises for Communicants'; 'Occasional Sermons'; 'Practical Sermons' (1855).

Lowell, Charles Russell, American soldier: b. Boston 2 Jan. 1835; d. near Middletown, Va., 20 Oct. 1864. He was graduated from Harvard in 1854, at the beginning of the Civil War was manager of the Mount Savage iron-works, Maryland, on 20 April 1861 was made a captain in the 6th United States cavalry, and during the Peninsular campaign, at the close of which he received the brevet of major, commanded a squadron of that regiment. Having been assigned to the personal staff of Gen. McClellan, he distinguished himself at Antietam. In November 1862 he organized the 2d Massachusetts cavalry, of which he became colonel on 10 May 1863. In the winter of 1863-4 he commanded the advanced defenses of Washington, and subsequently he was in command of the provisional cavalry brigade under Sheridan in the Shenandoah, and, ultimately, of the reserve brigade, consisting of three regiments of United States cavalry, the 2d Massachusetts, and a battery of artillery. With this force he fought at Opequen Creek (Winchester) (19 Sept. 1864), and defeated Gen. Rosser's cavalry (9 October). In the battle of Cedar Creek (19 October), he successfully resisted the Confederate attack until the arrival of Sheridan, but later in the action, while leading the final charge, was mortally wounded.

Lowell, Edward Jackson, American author: b. Boston 18 Oct. 1845; d. Cotuit, Mass., 11 May 1894. He was the grandson of Francis Cabot Lowell (1775-1817) (q.v.). He was graduated from Harvard in 1867, was admitted to the Suffolk County bar in June 1872, for a time practised law in Boston, but subsequently devoted himself exclusively to literary work. He was a member of the Massachusetts Historical Society and a fellow of the American Academy of Arts and Sciences. Among his writings are: 'The Hessians and the other German Auxiliaries of Great Britain in the Revolutionary War' (1884), recognized as standard; 'The Eve of the French Revolution' (1892); and the section on 'The Diplomacy and Finance of the Revolution' in Winsor's 'Narrative and Critical History of America' (1884-9).

Lowell, Francis Cabot, American manufacturer: b. Newburyport, Mass., 7 April 1775; d. Boston 10 Aug. 1817. In 1812 he began his attempts to manufacture cotton cloth, an undertaking then rendered the more difficult by the

fact that the war in progress with Great Britain prevented the importation of English machinery. He finally succeeded, by the aid of Paul Moody, a mechanic of Newburyport, in making a suitable loom, and with P. T. Jackson, his brother-in-law, obtained a charter as the Boston Manufacturing Company, with \$100,000 capital, and established at Waltham what is believed to have been the first mill in the United States to combine in one establishment the several operations necessary in manufacturing finished cloth from the raw cotton. He was active in introducing into the tariff act of 1816 the clause imposing a minimum duty on imported cotton fabrics. Jackson, subsequent to Lowell's death, bought a portion of Chelmsford and there located mills; and in 1826 the town was incorporated as Lowell.

Lowell, James Russell, American poet, critic and diplomat: b. Cambridge, Mass., 22 Feb. 1819; d. there 12 Aug. 1891. The Lowells were descended from Percival Lowell of Bristol, England, who emigrated to Massachusetts in 1639. Judge John Lowell, grandfather of the poet, contributed a clause to the Bill of Rights which effected the abolition of slavery in the State. One of the poet's uncles, Francis Cabot Lowell, was a leading promoter of manufactures in New England, and is remembered in the name of the city of Lowell. Another uncle, John Lowell, founded the Lowell Institute of Boston. Rev. Charles Lowell, the poet's father, b. 1782, was graduated at Harvard in 1800, and after some study at the University of Edinburgh, was settled over the West Church of Boston, and remained its pastor till his death in 1861. He married Harriet Spence, from a family of Spences in Portsmouth, N. H., who were of Scotch origin. She was the sister of Robert Traill Spence, of naval fame, and is remembered as having the gifts of "a great memory, an extraordinary aptitude for language, and a passionate fondness for ancient songs and ballads," as also a lively sense of humor. There were five children, two daughters and three sons, of whom James Russell was the youngest. He was prepared for college by William Wells, an English schoolmaster, who gave him an excellent drill in the rudiments of Latin. But perhaps the best part of his early education was derived from the unrestricted use of books at home. His father had come into possession of the old Tory mansion, on the Watertown road, later called Elmwood, and its abundant library was well stocked with attractive authors. He entered Harvard College in his 16th year, graduating in the class of 1838. He was not diligent in the prescribed work of the course, but engaged mainly in desultory reading and in writing essays and verse for college societies and magazines. Because of cleverness thus shown, he was made class poet. But the poem, his first considered effort, was not delivered, as the author had been ordered to Concord, for a brief rustication, on account of some neglect of college rules. It was published the next year, under the title of 'A Poem Recited at Cambridge.' Lowell now entered the Harvard School of Law, took its degree in 1840, and attempted practice. But he was quickly drawn aside to literature, largely through the influence of Maria White, a young lady of Watertown, to whom he became engaged in the latter part

of the same year. The poetic gifts and moral enthusiasm of this young woman quickened Lowell's nature, and gave his bent a purpose. In 1841 he collected some of his best poems into a volume called 'A Year's Life,' and inscribed it in covert language to his betrothed. Two years later he began, with Robert Carter, the publication of a literary monthly, called 'The Pioneer,' with Hawthorne, Poe, and Whittier among the contributors, but after three issues it was discontinued. In 1844 occurred his marriage with Maria White; and during the year were published an enlarged edition of the Poems, including 'A Legend of Brittany,' 'Prometheus,' 'Miscellaneous Poems,' and 'Sonnets,' and a volume called 'Conversations on some of the Old Poets.' In 1848 he again published an edition of the Poems, with the addition of the Third Series, including several poems against slavery. Later in the year 'The Vision of Sir Launfal,' 'A Fable for Critics,' and 'The Biglow Papers' came out, the last-named being a reprint of dialect poems furnished to the newspapers of the day. In nothing had Lowell been so effective as in these satires; nothing in the literature of those stirring times attracted more attention. In 1851 he sailed for Europe, with his wife, who was in failing health, and spent a year, mainly in Italy, in study and travel. After their return Mrs. Lowell's health did not improve, and in 1853 she died. A volume of her poems was printed, after her death, for private circulation. In 1855, on the resignation of Professor Longfellow, Lowell was elected Smith professor of the French and Spanish languages, and professor of belles lettres in Harvard College. He spent two years in Europe, to prepare himself more fully, and in 1857 took up the duties of his chair. He married Miss Frances Dunlap, of Portland, Maine, the same year. For the next 20 years his strength was taxed incessantly, being devoted, outside of his service in his college, to editorial and critical rather than poetic writing. He was the first editor of 'The Atlantic Monthly,' and continued in the position for two years. He had an editorial connection with the 'North American Review' from 1862 to 1873, and contributed to it many critical essays of unusual merit. In 1864 he reprinted, in ' Fireside Travels,' a few papers of less substantial worth. In the lighter work of this busy period falls the 'Biglow Papers,' Second Series, which he began in 1862. These were reissued in 1867. In the next year appeared 'Under the Willows,' a collection of his poems written since 1848. In 1869 he published 'The Cathedral,' over which he had long worked, and in 1870 'Among my Books,' a reprint of some of his best essays on literary themes. In 1871 followed 'My Study Windows,' of like contents, and in 1876 'Among my Books,' Second Series. In 1877 Lowell was called to take the post of Ambassador to Spain, and after three years at Madrid was transferred to the court of St. James. Here he won the admiration not only of his countrymen, but also of the more exacting English public, by his executive abilities and his social and oratoric gifts. He received public honors from Oxford, Cambridge, Edinburgh and Bologna, and in 1883 was chosen Lord Rector by the University of St. Andrews. His residence at St. James terminated in 1885, and the affliction of his wife's death came to

him, the same year, before return. He resumed to some degree his literary labors, after coming back to Cambridge. He published 'Democracy, and other Addresses' in 1887, and 'Heart's-ease and Rue,' and 'Political Essays,' in 1888. He prepared the public address for the celebration of the 250th anniversary of the founding of Harvard University, and delivered a course of lectures on the Old English Dramatists before the Lowell Institute. In the year before his death he revised and edited a definitive edition of his writings in 10 volumes. Supplemental to these, 'American Ideas for English Readers,' 'Latest Literary Essays and Addresses,' and 'Old English Dramatists,' were issued posthumously in 1892. Lowell was first and chiefly a man of books, yet without bookishness or pedantry. The most scholarly of all the group then making a name in literature, he was also the most executive and practical. He never lost the point of view of life, never lost sympathy with people, and was perhaps as wise and strong in affairs as in the fields of textual and æsthetic criticism. He lacked the grace and tenderness of Longfellow, but was gifted with deeper insight than any other of the New England school save Emerson.

Consult: Lowell's 'Letters,' edited by C. E. Norton (1894); Underwood, 'Lowell, a Biographical Study' (1893); Scudder, 'James Russell Lowell, a Biography' (1901); Hale, 'James Russell Lowell and His Friends' (1899); E. E. Hale, Jr., 'Lowell' in 'Beacon Biographies'; Wendell, 'Literary History of America' (1900).

L. A. SHERMAN,
Of the University of Nebraska.

Lowell, John, American jurist: b. Newburyport, Mass., 17 June 1743; d. Roxbury, Mass., 6 May 1802. He was graduated from Harvard in 1760, studied law, entered practice at Newburyport in 1762, represented that town in the general court in 1777 and Boston in 1779, and was a delegate to the convention of 1780 which framed the constitution of Massachusetts. He obtained the insertion in this document of the clause of the preamble which declares that "all men are born free and equal," with the belief that slavery would thus be abolished in Massachusetts. The supreme court of the State upheld his contention in 1783, and thereby slavery in the State was abolished at his initiative. In 1782-3 he was a delegate in the Continental Congress, and in 1782 was appointed by the congress one of three judges of a court of appeals to hear appeals from courts of admiralty. He was made by Washington in 1789 judge of the United States district court of Massachusetts, and by Adams in 1801 chief justice of the 1st circuit of the United States circuit court. He was a founder of the American Academy of Arts and Sciences (1780), and one of its councillors. He published an oration on James Bowdoin the elder in Vol. II. of the 'Memoirs' of the American Academy; and a poem in 'Pietas et Gratulatio' (1761).

Lowell, John, American publicist: b. Newburyport, Mass., 6 Oct. 1769; d. Roxbury, Mass., 12 March 1840. He was a son of John Lowell (1743-1802) (q.v.). He was graduated from Harvard in 1786, studied law, was admitted to the bar in 1789, retired from practice in 1803, and after travel in the East (1803-6) devoted his attention to literature. He wrote on agriculture

JAMES RUSSELL LOWELL.

LOWELL

and theology, but chiefly on politics. In various publications he attacked the War of 1812; and by his pen made himself a valuable aid of the Federalists. His interest in horticulture obtained for him the sobriquet of "the Columella of the New England States"; and he was the first in the United States to build extensive greenhouses on a scientific plan. For many years he was president of the Massachusetts Agricultural Society. Among his pamphlets were: 'Peace Without Dishonor, War Without Hope' (1807); 'Diplomatic Policy of Mr. Madison Unveiled' (1810); 'Candid Comparison of the Washington and Jefferson Administrations' (1810); and 'Mr. Madison's War' (1812).

Lowell, John, American merchant and philanthropist; b. Boston, Mass., 11 May 1799; d. Bombay, India, 4 March 1836. He was the son of F. C. Lowell (1775-1817) (q.v.). He studied at Harvard (1813-5), became a successful merchant in Boston, was several times elected to the Boston common council and the State legislature of Massachusetts, and collected a large and valuable library. After 1830 he passed a large part of his time in travel in foreign lands. By the gift of about \$250,000, — then the largest ever made in America by an individual for the endowment of a literary institution, with the exception of Girard's bequest for Girard College — he established in Boston the Lowell Institute, to consist of regular annual courses of free public lectures. The institute was opened in the winter of 1839-40, and has proved exceedingly successful. Consult: Everett, 'Memoir of John Lowell, Jr.' (1840); and Smith, 'History of the Lowell Institute' (1898).

Lowell, Josephine Shaw, American philanthropist; b. West Roxbury, Mass., 16 Dec. 1843; d. New York city, 12 Oct. 1905. During the Civil War she was connected with the work of the Sanitary Commission, and subsequently with labors among the freedmen and with other causes of philanthropy and reform. She was a founder of the Charity Organization Society of New York in 1881, in 1886-9 was commissioner of the State Board of Charities of New York, and in 1899 was appointed to the board of managers of the New York State reformatory for women. Among her writings are: 'Public Relief and Private Charity' (1884); 'Industrial Arbitration and Conciliation' (1893).

Lowell, Maria White, American poet; b. Watertown, Mass., 8 July 1821; d. Cambridge, Mass., 27 Oct. 1853. She was the wife of James Russell Lowell. The best known of her poems are: 'The Alpine Shepherd' and 'The Morning Glory,' which appeared in the collection printed privately at Cambridge in 1855. The death of Mrs. Lowell, occurring the same night that a child was born to Mr. Longfellow, called forth the latter's poem beginning:

Two angels, one of life and one of death,
Passed o'er our village as the morning broke.

Lowell, Percival, American astronomer; b. Boston 13 March 1855. He was graduated from Harvard in 1876, for several years resided in Japan, and in 1883 was made secretary and councillor to the special commission to the United States from Korea, the first embassy sent from that country to any Western power. In 1894 he established at Flagstaff, Ariz., the Lowell Observatory, which in 1896 was for a time removed to

Mexico City. He was elected a member of the Royal Asiatic Society of Great Britain and Ireland, and a fellow of the American Academy of Arts and Sciences. He lectured before the Lowell Institute in 1893-4 and 1894-5, contributed various articles to the publications of learned societies, and wrote: 'Chosŏn; The Land of the Morning Calm' (1885); 'The Soul of the Far East' (1886); 'Noto: An Unexplored Corner of Japan' (1891); 'Occult Japan, or the Way of the Gods' (1894); 'Mars' (1895); and 'Annals of the Lowell Observatory' (Vol. I., 1898; Vol. II., 1900).

Lowell, Robert Traill Spence, American Episcopal clergyman; b. Boston 8 Oct. 1816; d. Schenectady, N. Y., 12 Sept. 1891. He was a son of Charles Lowell (q.v.) and a brother of James Russell Lowell (q.v.). He was graduated from Harvard in 1833, for a time studied medicine in the Harvard medical school, and later was in mercantile life at Boston. In 1839 he began the study of theology; went to Hamilton, Bermuda; was there ordained deacon in 1842 and priest in 1843; and became inspector of schools for the colony and domestic chaplain to the bishop. In 1843-7 he was rector at Bay Roberts, Newfoundland, and during the famine of 1846 in that district rendered valuable service as chairman of the relief committee. Having returned to the United States in 1847, he was active in mission work among the poorer classes at Newark, N. J.; was rector of Christ Church, Duaneburg, N. Y., in 1850-69, head-master of St. Mark's school (Southboro, Mass.) in 1869-73, and professor of Latin language and literature in Union College in 1873-9. He published 'The New Priest in Conception Bay' (1858; revised in 1889), in which Bay Roberts appears as 'Peterport'; 'Fresh Hearts That Failed Three Thousand Years Ago, and other Poems' (1860); 'Anthony Brode' (1874); 'Burgoyne's March' (1877), written for the Saratoga County celebration at Bemis Heights; and 'A Story or Two from an Old Dutch Town' (1878).

Lowell, Mass., city, county-seat of Middlesex County; at the junction of the Concord and Merrimack rivers, and on the New York, N. H. & H. and the Boston and M. R.R.'s; about 25 miles northwest of Boston. Lowell, formerly Chelmsford, was founded in 1822, by the "Merrimack Manufacturing Company," and named in honor of Francis Cabot Lowell (q.v.). In four years it was incorporated as a town, and in 1836 it was chartered as a city. The city now has an area of over 12 acres. The city is noted for its great number of manufactories and its large annual output of manufactured articles. The power is obtained from the falls of the Merrimack which here descend 32 feet and from the Concord River; but some steam power is used. The "Canal and Lock Company" was organized early in the 19th century, for the purpose of obtaining and supplying power for cotton factories. The canal system was nearly completed in 1825, but the first canals were more like ordinary ditches; now they are walled and fitted with locks and bridges, all of the best construction and latest improvements. They are so well built, that the annual amount spent for repairs is comparatively small. By means of this canal system water-power is furnished to many factories in Lowell, then returned to the Merrimack to be used lower down the stream to

LOWER CALIFORNIA—LOYALISTS

turn the wheels for the mills in Lawrence, Haverhill and Newburyport. Coal is so expensive in Lowell that water-power is used extensively; but the large mills are fitted with steam-power machinery that may be used in a dry season.

Some of the manufacturing establishments are woolen and cotton factories, hosiery and knitting mills, carpet and felt factories, bleacheries, dyeing works, machine-shops, patent-medicine works, a cartridge factory, and furniture factories. Lowell has many points of historic and scenic interest and a number of fine public buildings. The educational institutions are the State Normal School, the Rogers Hall School, the Lowell Textile School, Saint Patrick's Academy, a high school, and public and parish elementary schools. The city has the Lowell Hospital, Lowell General Hospital, Saint John's Hospital, Saint Peter's Orphanage, Theodore Edson Orphanage, Ayer Home for Young Women and Children, Saint Patrick's Home for Working Women, and the Old Ladies' Home.

The annual amount of municipal expenditures is about \$1,320,000; the principal items are: for schools about \$330,000; for hospitals, almshouses, etc., \$120,000; for police department, \$121,000; for the fire department, \$118,000; for municipal lighting, \$84,500; for waterworks, \$85,000. The waterworks were built in 1873 at a cost of about \$2,875,000. There are now about 130 miles of mains. The waterworks are owned and operated by the city. Pop. (1890) 77,696; (1900) 94,999, about 44 per cent of whom are of foreign birth, many from Canada. Consult: Drake, 'History of Middlesex County'; 'Illustrated History of Lowell.'

Lower California. See CALIFORNIA, LOWER.

Lowndes, Lloyd, American capitalist and politician: b. Clarksburg, W. Va., 21 Feb. 1845; d. Cumberland, Md., 8 Jan. 1905. He was graduated from Alleghany College, Meadville, Pa., and from the law school of the University of Pennsylvania. He entered the Maryland legislature in 1871 as a Republican, and from 1895-9 was governor of Maryland.

Lowndes, Marie Adelaide Belloc, English author; b. 1868. She is a sister of Hilaire Belloc (q.v.) and was married to F. S. Lowndes in 1896. She has published 'Life and Letters of Charlotte Elizabeth, Princess Palatine' (1889); 'King Edward VII.' (1901); 'The Philosophy of the Marquise,' a novel in dialogue (1899).

Lowndes, Rawlings, American statesman: b. in the West Indies 1722; d. 1800. His parents removed with him to Charleston when he was very young, and his career was ever after associated with that city. Having studied law he became an associate judge of the colonial court in 1766, and in that position opposed the Stamp Act. He assisted in outlining a new constitution for South Carolina in 1776, and in 1788 became president of the State. He was subsequently a member of the State legislature and vigorously opposed the ratification of the Federal constitution.

Lowth, Robert, English prelate and biblical scholar: b. Winchester, Hampshire, 27 Nov. 1710; d. London 3 Dec. 1787. Educated at Winchester School and Oxford University, he became professor of poetry in the latter in 1741, and in 1744 was appointed rector of Ovington, Hampshire. In 1753 he published his lectures on 'The

Sacred Poetry of the Hebrews,' and became famous as one of the first biblical critics of his age. Ecclesiastical preferments followed, and he was made successively prebend of Durham, bishop of St. David's, (1766), of Oxford the same year, and of London in 1777. In 1783 he declined the archbishopric of Canterbury. In 1778 he published 'Isaiah, a New Translation,' with a preliminary dissertation and notes, which was highly commended.

Lowville, 16'vil, N. Y., village, county-seat of Lewis County; on the New York Central & Hudson River railroad; about 100 miles northwest of Albany and 60 miles north by west of Utica. It is situated in an agricultural section, and the industries of the village are connected chiefly with farm and dairy products. Its trade is principally in hay, grain, vegetables, and the noted Lewis County butter and cheese. The principal buildings are the town-hall, the county buildings, a club-house, and the Lowville Academy. The academy library has about 4,500 volumes. Pop. (1900) 2,352.

Loxodromic Curve, the course which is represented by the path of a ship when her course is directed constantly to the same point of the compass, thereby cutting all the meridians at the same angle.

Loy, Matthias, American Lutheran theologian: b. Cumberland County, Pa., 17 March 1829. He was graduated from the Theological Seminary at Columbus, Ohio, in 1849, and was pastor at Delaware, Ohio, 1849-65. He was editor of the 'Lutheran Standard' (1864-91), and president of the Evangelical Lutheran Synod of Ohio 1860-78, and 1880-94. He has published 'The Doctrine of Justification' (1869); 'Christian Prayer' (1890); 'The Christian Church' (1898); etc.

Loyal Legion of the United States, Military Order of the, was the first society formed by officers in the Civil War, who were honorably discharged. Members are eligible from the army, navy and marine corps. On the day after the assassination of President Lincoln, Col. S. B. Wylie Mitchell, Capt. Peter D. Keyser, M. D., and Lieut.-Col. T. Ellwood Zell met in Philadelphia to arrange for a meeting of ex-officers of the army and navy to adopt resolutions relative to the death of President Lincoln. It was decided to effect a permanent organization, and an adjourned meeting was held for this purpose in the hall of the Hibernia Fire Company in Philadelphia 3 May 1865. There are State commanderies in Pennsylvania, New York, Maine, Massachusetts, California, Wisconsin, Illinois, District of Columbia, Ohio, Michigan, Minnesota, Oregon, Missouri, Nebraska, Kansas, Iowa, Colorado, Indiana, Washington, and Vermont. The total membership in 1902 was over 10,000.

Loyal Temperance League, an organization of children founded in 1886, by the Woman's Christian Temperance Union, for the purpose of teaching children the evil effects of alcohol and tobacco. The graduates, who follow a systematic course of instruction, are organized into State legions, holding annual conventions. There are upward of 200,000 members in the United States.

Loyalists, or Tories, in American history, were those persons who remained loyal to Great Britain, during the Revolutionary War. They

represented all classes, a majority of them, however, being office holders and members of learned professions. Others were adventurers who adhered to England with the hope of gain or official preferment. At the close of the Revolution the Royalists were estimated at 1,000,000 or a third of the entire population of the colonies. The Whigs took vigorous action against the loyalists, banished many of them under penalty of death and confiscated the estates of others. Between 40,000 and 50,000 loyalists are said to have fled to Canada prior to 1786. Consult: Ryerson, 'Loyalists of America, 1620-1816,' (1880); Van Tyne, 'The Loyalists in the American Revolution' (1902).

Loyalty Islands, a group in the Pacific Ocean, east of New Caledonia, of which French colony they form a dependency. They consist of the islands Uvea (Uea), Lifu, and Maré, with many small islands. Total area, about 1,040 square miles. Water is scarce, but some fruits, vegetables, and grains are cultivated. The inhabitants are of mixed descent, Melanesian and Polynesian, and nearly all Protestants. Pop. about 20,000.

Loyola, 16-yō'lā, **Ignatius** (INIGO LOPEZ DE RECALDE), founder of the order of the Jesuits: b. at the castle of Loyola, Guipuzcoa 1491; d. Rome 31 July 1556. He seems to have been from the first an enthusiastic temperament, which was fomented by the Spanish romances, in which religion and chivalry are blended, and is said in early youth to have himself written a romance of which the apostle Peter was the hero. In 1505 he became attached as a page to the household of Ferdinand V. His relative Don Antonio Manriquez, duke of Najara, trained him to the profession of arms and his valor was indicated at the siege of Pampeluna, on the occasion of the invasion of Navarre by Francis I. in 1521, when the garrison was induced to hold out by his example alone. Loyola was made a prisoner by the French, having been wounded in both legs by a cannon ball in such a manner as to render him lame for life. He had twice to undergo a painful operation, followed by a long confinement. The only books he found to relieve its tedium were books of devotion and the lives of saints. This course of reading threw him into a state which he has minutely described in his 'Spiritual Exercises,' a devotional book written in Spanish, and which has been translated into many languages. His ambition now turned from a military life, for which he was incapacitated, to imitation of the self-denial of Saint Dominic and Saint Francis. He made pilgrimage to Montserrat in Catalonia, where he hung up his arms before the Virgin and assumed the pilgrim's staff. After dedicating himself to the church at Montserrat he proceeded to the hospital of the Dominican convent of Manresa, where he devoted himself to the care of the poor and sick. After ten months spent at Manresa he proceeded on a pilgrimage to Rome and Jerusalem (1523). His object at this time was the conversion of the infidels, but being refused a permanent residence at Jerusalem by the primate of the church he returned to Spain, and attended (1524-7) the schools and universities of Barcelona, Alcalá, and Salamanca. In Spain he was several times arrested by the Inquisition under suspicion of heresy, but was always acquitted. He then went to Paris, where, placing himself in

the lowest classes, he went through, from 1528 to 1535 a course of general and theological training. Here he formed the first nucleus of the society which afterward became so famous. Under his influence Pierre Le Fèvre, a Savoyard priest, Francis Xavier, professor of philosophy, Lainez, Salmeron, Bobadilla and Rodriguez of Azevedo, students, met together with Loyola on 15 Aug. 1534, in a subterranean chapel of the Abbey of Montmartre, took the sacrament administered by Le Fèvre, and bound themselves together by vows of chastity and poverty, devoting themselves to the care of the church and the conversion of infidels. In 1536 he met the members of this body at Venice with a view to the pilgrimage to Jerusalem, but the war which broke out in 1537 between the Venetians and the Turks prevented the accomplishment of this object. At Venice Loyola became attached to Cardinal Caraffa (Paul IV.), the founder of the order of the Theatines, and proceeded to Rome to procure the recognition of his order, which was granted partially in 1540, and fully three years later, taking the name of the Company of Jesus. Besides the vows of poverty and chastity their vow of obedience bound them to perform unhesitatingly all the commands of the pope. They discarded the peculiar garb by which monastic orders were usually distinguished, and devoted themselves to the highest objects to which a religious society could aspire—the education of youth, the defense of the church, and the propagation of the faith. Besides missionary enterprises for the extension of the church, their chief means of influence were the pulpit, the confessional, and their schools and colleges for training the young. Thus the romantic devotion of Loyola took a practical shape. On 22 April 1541 Loyola was elected general of the order, and drew up its constitution, assisted by the organizing genius of Laynez. He continued to reside in Rome and govern the society he had constituted till his death. He died worn out with the fatigues of his ascetic severities on 31 July 1556. He was beatified in 1607 by Paul V., and canonized in 1622 by Gregory XV. See JESUITS.

Loyson, Charles, shārl lwā-zōn (known by his monastic name, PÈRE HYACINTHE), French ecclesiastic: b. Orléans 10 March 1827. He studied in the College of Pau and the ecclesiastical college of Saint Sulpice, was ordained priest in 1850, taught philosophy at the seminary of Avignon and theology at that of Nantes, entered the Carmelite order, and became renowned as a preacher at Lyons, Bordeaux, Nantes, and Paris. But his unorthodox utterances soon drew the censure of ecclesiastical authority, and his superiors prohibited him from preaching. He then left the Order, and refusing to remain silent, he was excommunicated. In 1869 he visited the United States, where he was heartily welcomed. He protested against the dogma of papal infallibility, attended the Old Catholic congress in Munich, and to some extent fraternized with Protestants, but he repeatedly declared that he had no intention of leaving the Catholic Church. In 1873 he became pastor of an Old Catholic church at Geneva, and thus the founder of the Christian Catholic Church of Switzerland. In 1878 he opened in Paris an independent church, the Eglise Gallicane. Among his writings are: 'Le Dimanche et les Classes laborieuses'; 'L'Eglise catholique en Suisse'; 'La Réforme catholique,' and other works.

Lozier, lō'zhēr, **Clemence Sophia** (HARNED), American physician: b. Plainfield, N. J., 11 Dec. 1812; d. New York 26 April 1888. In 1829 she was married to A. W. Lozier; in 1849 began the study of medicine, and in 1853 was graduated from the Syracuse Medical College. She entered practice in New York, and there had great success as a surgeon. The New York medical college and hospital for women was founded largely through her efforts, and for many years she was a professor in that institution and dean of its faculty. She was also for four years president of the National Woman Suffrage Society. She was a prominent woman suffragist and active in reform and philanthropic movements.

Lualaba, loo-ā-lā'bā, Central Africa, a head-stream of the Kongo River, which rises near Kabinda on the southern boundary of the Kongo Free State, receives several affluents such as the Lufira and Lubudi, passes through a hilly, forest and lake region, and after a course of about 650 miles, the last 250 of which are navigable, unites with the Luapula (q.v.) at Ankoro to form the Kongo.

Luapula, loo-ā-poo'lā, Central Africa, a river, the chief of the two principal head-streams of the Kongo. It rises as the Chambezi south of Lake Tanganyika, near Fwamba on the Stevenson Road, flows southwest through Lake Bangweolo whence it issues as the Luapula, flows northward through Lake Moero, then northward until it unites at Ankoro with the Lualaba (q.v.) to form the Kongo.

Lubang, loo-bāng', Philippines, the largest and only inhabited island of the group of the same name lying at the western entrance of the Verde Passage between Luzon and Mindoro, southwest of Manila. The island of Lubang is 17 miles in length from northwest to southeast; area, 51 square miles; area of group 76 square miles. The interior of the island is mostly mountainous, but the coasts are low. The chief town is Lubang on the north coast, which has considerable native trade; the only port safe for all vessels at all seasons of the year is Tilig, on the northeast coast. Civil government was established in these islands in 1901, and in June 1902 they were detached from the province of Cavite and annexed to the province of Marindique. Pop. 3,000.

Lubao, loo-bā'ō, Philippines, a pueblo of the province of Pampangas, Luzon, situated on the northwestern channel of Pampanga delta, 5 miles south of Bacolor. It is the trade centre of an agricultural region. Pop. 21,200.

Lubbock, lüb'ök, **Francis Richard**, American politician: b. Beaufort, S. C., 16 Oct. 1815; d. 22 June 1905. He went to Texas in 1836, held the office of comptroller under the republic of Texas, in 1856 became lieutenant-governor of Texas, and was its governor in 1861-3, whence he was known as the "war governor." Subsequently he entered the Confederate service, became colonel of cavalry, was aide-de-camp to President Jefferson Davis and was captured with Davis and imprisoned for eight months in Fort Delaware. He wrote 'Six Decades in Texas' (1900).

Lubbock, John, **BARON AVEBURY**, British archaeologist and man of science: b. London 30 April 1834. He was educated at Eton and

joined the banking business of his father, Sir John William Lubbock (q.v.) in 1848, becoming a partner in 1856. He rose to great eminence in his profession, and was appointed to various honorable and responsible posts in connection with it. He entered Parliament in 1870 for Maidstone in the Liberal interest, and from 1880 till 1900 sat for London University, from 1886 as a Liberal Unionist. In 1900 he was raised to the peerage as Baron Avebury. He is a recognized authority on financial and educational questions, and his name is associated with several important public measures, such as the bank holidays, ancient monuments, shop hours, and public libraries acts. He is still more distinguished as a man of science. His studies have been chiefly directed toward the ancient remains and history of mankind; and the habits of insects, particularly of wasps, ants, and bees. Among his volumes are: 'Prehistoric Times' (1865); 'Origin of Civilization' (1870); 'Origin and Metamorphoses of Insects' (1874); 'British Wild Flowers in their Relation to Insects' (1875); 'Addresses: Political and Educational' (1879); 'Ants, Bees, and Wasps' (1882); 'Representation' (1885); 'Flowers, Fruits, and Leaves' (1886); 'The Pleasures of Life' (1887); 'The Senses, Instincts, and Intelligence of Animals' (1889); 'The Beauties of Nature' (1892); 'The Use of Life' (1894); 'The Scenery of Switzerland' (1896); and 'Buds and Stipules' (1898), besides a large number of papers in the transactions of learned societies. He has done much to promote a popular interest in matters of science, not only by making more accessible the work of others, but by extensive personal investigation. He presided over the York meeting of the British Association in its jubilee year (1881), and the address he delivered on that occasion was published separately under the title 'Fifty Years of Science.' He is connected with a large number of scientific bodies both in the United Kingdom and on the Continent.

Lubbock, Sir John William, English astronomer and mathematician: b. Westminster, London, 26 March 1803; d. 20 June 1865. He was graduated from Trinity College, Cambridge, in 1825; became a banker; found an avocation in scientific studies; made particular investigations in physical astronomy and Laplace's theory of probability; was treasurer and vice-president of the Royal Society in 1830-5 and 1838-47; and was the first vice-chancellor of London University (1837-42). Among his writings are: 'An Elementary Treatise on the Computation of Eclipses and Occultations' (1835); 'An Elementary Treatise on the Tides' (1839); and 'On the Gnomonic Projection of the Sphere' (1851).

Lübeck, Germany, one of the three free city-states (see FREE CITIES), and a constituent of the German confederation, situated on a low ridge at the confluence of the Wackenitz with the Trave, 38 miles northeast of Hamburg, and 12 miles from the Gulf of Lübeck, on the Baltic. It was anciently surrounded by walls and bastions, which have been leveled and converted into pleasant walks; but it is still entered by four gates, and furnishes striking specimens of the architecture of the 15th and 16th centuries. Among the buildings are the cathedral, a structure of red brick, begun

in 1173, surmounted by two spires 416 feet high, and containing a finely carved choir-screen; the Marienkirche (St. Mary's Church), a fine specimen of early Gothic, the Ägidienkirche (St. Giles' Church) and the Petrikirche (St. Peter's Church); the town or senate house, an ancient Gothic building; the Hospital of the Holy Ghost (13th century); the Holstein Gate, with its two lofty towers, etc. There is a public library of about 100,000 volumes. The city has fine municipal waterworks, electric lighting and a system of electric street railroads connecting the suburbs. The manufactures are comparatively unimportant, but the trade is extensive, especially with Hamburg, the Baltic ports, and the interior of Germany. Lübeck possesses a territory of 116 square miles, and includes the port of Travemünde, and several isolated portions in Holstein and Lauenburg. It has a senate of 14 members and a council of burgesses of 120 members. It became an imperial free city in 1226, and about 30 years later it became the head of the Hanseatic League. It is represented by one member in the Bundesrat and one in the Reichstag (q.v.). Pop. of city (1900) 82,098; of city and state 96,755.

Lübke, Wilhelm, vil'hēlm lüb'kè, German historian of art: b. Dortmund, Westphalia, 17 Jan. 1826; d. Karlsruhe (Baden) 5 April 1893. He studied at Bonn and Berlin; held the chair of architecture at the Building Academy of Berlin in 1857-8; was professor of the history of art and archaeology at the polytechnic school at Zürich 1861-6; at Stuttgart, 1866-85; and at the high school in Karlsruhe, 1885-93. Chief among his works are: 'Mediaeval Art in Westphalia' (1853), which at once gave him a high place among art-critics; the 'History of Architecture' ('Geschichte der Architektur' 1855), the first popular manual of the subject, and a great success; 'Outlines of the History of Art' (1860, 11th ed. 1891), translated into English by Clarence Cook, 1880; 'History of the Renaissance in France' (1868); 'History of the Renaissance in Germany' (1873); 'History of German Art' (1888); 'Recollections' (1891). He was extremely versatile, and previous to his work in art, gave instruction in vocal and pianoforte music.

Lublin, loo'blin, Russian Poland, capital of the government of Lublin; on the Bistrizta, about 95 miles southeast of Warsaw. Lublin was, in the 12th century, a place of importance. The union of Poland and Lithuania was decreed at a diet which met here in 1568. There are at present some manufactures, chiefly woollen goods, agricultural implements, and leather. There is a jail with which is connected a government cloth-factory. Lublin has several good educational institutions and a number of ancient buildings. Pop. about 52,000, one half of whom are Jews.

Lu'bricant, any substance applied to machinery or any rubbing surfaces to diminish friction. Lubricants fill the interstices between the particles of the surfaces in contact, and so prevent their interlacement. Tallow is used where the rubbing surfaces are of metal and wood, and even when they are both metal, if they happen to be rough. Oil is more commonly employed for metal surfaces, and the harder and smoother the surfaces, the finer must be the oil. Powdered plumbago has been used

for highly polished surfaces. Water is found to be a good lubricant at all rubbing surfaces which happen to be under water. Very many other substances are also in use as lubricants, such as cottonseed oil, olive oil, sperm oil, castor oil and other vegetable oils. Hard lubricants include graphite and soapstone. See also OILS.

Lucan, lū'kan (MARCUS ANNÆUS LUCANUS), Roman poet: b. Corduba, Spain, 39 A.D.; d. 65. His father, a Roman knight, was the youngest brother of the philosopher Seneca. Lucan went to Rome when a child, and having early obtained celebrity, was forbidden by Nero, who himself aspired to literary honors, to recite in public. This induced Lucan to join the conspiracy of Piso. The plot was discovered, and Lucan, who is said to have informed against his own mother as accessory, was condemned to death. He chose the death of Seneca, and had his veins opened. Of his poems, only his 'Pharsalia' has come down to us, in which he narrates, in ten books, the events of the civil war between Cæsar and Pompey. The poem is unfinished, and as it appears to have been produced at different times, it is uncertain whether it was left unfinished by the author or whether the latter part has been lost. In the earlier portions the liberal sentiments of the author are checked by deference to the emperor, in the latter he is inveighed against in unsparing language. The best editions are Burmann's (Leyden, 1740), Weber's (Leipsic, 1821-31), and those of Haskins (Cambridge, Eng., 1887), Hosius (Leipsic, 1892), and Francken (Leyden, 1896-7). Lucan has been translated into English by Rowe (1718) and by Riley (1853).

Lucania, lū-kā'nī-a, Italy, a district of ancient Italy, corresponding nearly to the present province of Potenza and the eastern part of Salerno. The region was mountainous, and covered with extensive forests. The Chones and the Enotrians were the ancient people of this section; but before the introduction of Christianity into Italy, they had been nearly destroyed. Lucania became Roman territory about 300 B.C.

Lucas, lū'kas, **Daniel Beddinger**, American lawyer and author: b. Charlestown, W. Va., 16 March 1836. He was graduated from the University of Virginia (Charlottesville, Va.), in 1856; in law from Washington College (Lexington, Va., now Washington and Lee University) in 1858; in the Civil War served in the Confederate army on the staff of Governor Wise of Virginia in the Kanawha Valley, and from 1867 practised law at Charlestown. In 1884-7 he was a member of the West Virginia legislature; in 1887-8 was a United States senator under appointment of the governor; and in 1888-93 was president of the supreme court of appeals of West Virginia. He was a presidential elector on the Democratic ticket in 1872, 1876, 1884, and 1896. He obtained in the South a considerable reputation as a public speaker, and published a 'Mémoir of John Yates Bell' (1865); 'Nicaragua and the Filibusters'; and, in verse, 'The Wreath of Eglantine and other Poems' (1869); 'The Maid of Northumberland: A Dramatic Poem' (1879); and 'Ballads and Madrigals' (1884).

Lucas, **Edward Verrall**, English author: b. 12 June 1868. He was connected with the London 'Globe' 1893-1900 and with the 'Academy' 1896-1901. He has published a popular 'Book

of Verses for Children' (1897), as well as other works for young readers; 'The Open Road' (1899); etc.

Lucas, John Seymour, English artist: b. London 21 Dec. 1849. He studied with the wood-carver Gerard Robinson; and painting at the Royal Academy; first exhibited at the Academy in 1872; first made his mark by his 'By Hook or Crook,' shown at Burlington House in 1875; and obtained recognition for the high technical excellence of his work. Among his later canvases are 'Fleece'; 'For the King and the Cause'; 'Intercepted Despatches'; 'Charles Before Gloucester'; 'After Culloden'; 'The Call to Arms.'

Lucbán, look-băn', or Lugbang, loog-bång, Philippines, pueblo of the province of Tayabas, Luzon, 8 miles northwest of Tayabas, the provincial capital. It is in the heart of a mountainous region, and in the surrounding country rice is grown on *savvas* or terraces on the hillsides. It is on the main road, and has a profitable trade. The chief industries are the weaving of fine straw hats from the fibre of the buri palmleaf, and the manufacture of pandanus mats. Pop. 12,800.

Lucca, look'kà (originally LUCAS), Pauline, Austrian opera singer: b. Vienna 25 April 1842. She made her first appearance in opera in 1859 as Elvira in Verdi's 'Ernani' at Olmütz; at once attained great success on the Continent; and later sang in London (1863-5) and New York (September 1872). Illness impaired her voice and in 1889 she retired. Among her chief parts were those of Margaret, in 'Faust'; Cherubino, in 'Le Nozze di Figaro'; and Zerlina in 'Fra Diavolo.'

Lucca, Italy, the capital of the province of Lucca, and former capital of the ancient Tuscan republic and duchy of Lucca, near the left bank of the Serchio, 37 miles by rail northwest of Florence. Encircled by walls flanked with bastions, it stands in a fertile plain surrounded by the Apennines, and has a striking appearance. It is entered by four gates and is well built. Lucca is an archiepiscopal see, and the seat of several important courts and public offices. It contains numerous antiquities; one of the most interesting is the fish-market, the large oval of which is the Roman amphitheatre; while the buildings around it, though converted into modern dwellings, are in a great measure composed of the ruins of the amphitheatre, and exhibit huge solid arches, and masses of brick and stone, on their original sites. The principal edifices are the *Duomo*, or cathedral, with a magnificent façade, a Romanesque portico, and stained glass of the richest kind; the Church of San Michele, an ancient and imposing structure; the Church of San Frediano, founded in 686, furnishing an interesting specimen of early Christian architecture, and adorned with fine mosaics, frescoes, and paintings; the ducal palace; the Palazzo Borghi, now converted into a poor-house; and an aqueduct, carried from a distance into the city, over 459 arches. The manufactures consist chiefly of silk goods; and there are numerous silk mills. The trade is almost confined to the above articles of manufacture, agricultural produce, and olive-oil, particularly the latter, which bears a high name, and is largely exported. Pop. of commune (1901) 74,971.

First an Etruscan, then a Ligurian town, Lucca 177 B.C., became a Roman colony. It followed the varied fortunes of northern Italy until about 1115 it was made the seat of a republic. In 1320 it fell under the dominion of Castruccio Castracani, who became Duke of Lucca, and after his death Lucca was sold to Florence. It purchased its liberty from Charles IV. in 1369, and maintained its independence until the French occupation in 1799. In 1814 the Congress of Vienna re-created it a duchy. It became part of the kingdom of Italy in 1860.

Luce, Stephen Bleecker, American naval officer: b. Albany, N. Y., 25 March 1827. He was appointed midshipman from New York in 1841; saw service in various waters and made the circuit of the globe; during the Mexican War was on the Pacific coast; and in the Civil War was commander of the monitor *Nantucket*, and of the *Sonoma*, *Canandaigua*, and *Pontiac*. In 1884-6 he was president of the naval war college, and in 1886-9 was in command of the North Atlantic station as head of the rear-admirals on the active list. On 25 March 1889 he was retired. He was an associate editor of the 'Universal Cyclopædia,' naval editor of the 'Standard Dictionary,' and author of 'Seamanship' (1863-68), 'Naval Songs' (1889), and 'The Patriotic and Naval Songster.'

Lucena, loo-thā'nā, Spain, an Andalusian city in the province of Cordova, 30 miles southeast of that city, in a picturesque hilly situation. It is well built, has a fine parish church, schools, benevolent institutions, a town-house, a magnificent "paseo" or public promenade, and in the neighborhood are medicinal baths of repute. It manufactures linens, shoes, earthenware, glass, iron, copper, and other metallic vessels, oil, vinegar, brandy, and is in a region noted for its wines, and for stock-raising. Pop. (1900) 21,294.

Lucerne, lü-sèrn' (Fr. lû-särn), Switzerland, the capital of the canton of Lucerne, and one of the three seats of the Swiss diet, on an acclivity at the west end of Lake Lucerne. The Reuss, which issues from the lake and flows through the town, is crossed by five bridges, two of which are covered and ornamented with curious mediæval paintings, including a Danse Macabre. The town retains its feudal walls and watch-towers, and with the neighboring mountains, including the Pilatus and Rigi, is noted for its picturesque features and scenic beauties, making it a much-frequented tourist centre. Lucerne is well-built, has regular, clean streets, electrically lighted and traversed by street railroads, a town-hall, with collections in art and antiquities; Jesuit college, now the government building; a 15th century parish church, with two slender towers; a Gothic Protestant church; Ursuline convent, with handsome church; a museum and cantonal library of 90,000 volumes; large town hospital, poor-house, deanery, arsenal, a new International Museum of War and Peace, mint, casino, etc.; and besides the college or lyceum, several well-conducted educational establishments. An interesting monument is the 'Lion of Lucerne,' designed by Thorwaldsen, in memory of the Swiss guards who fell in Paris in 1792 while defending the Tuileries, and hewn out of the solid rock. Lucerne has some transit trade, but the manufactures are unimportant; it depends chiefly

LUCERNE—LUCIUS

on the important tourist traffic, accommodating annually over 100,000 visitors. Pop. (1900) 29,255.

Lucerne, Lake of, or Vier-Waldstättersee (Lake of the Four Forest Cantons), Switzerland, the largest, and in many respects the most magnificent, Swiss lake, near the centre of the country, 1406 feet above sea-level, surrounded by the cantons of Lucerne, Schwyz, Uri, and Unterwalden. It is irregular in shape, and divided into reaches, separated by narrow straits, giving it the appearance of three distinct lakes. The extreme length from west to south through its centre is 25 miles; average width, 3 miles; extreme width, 9 miles; while the depth varies from 300 to 900 feet. It presents every variety of lake scenery. In the upper reach, lofty mountain masses, including Pilatus and the Rigi, tower above the lake, and descend in sheer precipices to its very edge. Owing to the violent storms which suddenly burst over the lake, its navigation is dangerous. Steamers ply regularly upon it. The Reuss River enters the lake at Flüelen and flows out of it at Lucerne. Cut out of the solid rock on the eastern shore is the Axenstrasse, one of the most beautiful of lake-shore roads.

Lucerne, the European term for the fodder plant called in America alfalfa (q.v.).

Luchaire, Achille, à-shêl lû-shâr, French historian: b. Paris 24 Oct. 1846. He was at first professor in the Bordeaux faculty of letters, and in 1885 was made a professor at Paris, where in 1889 he obtained the chair of mediæval history. In addition to studies of the Basque language, such as 'Noms de Lieux du Pays Basque' (1872), and 'De Lingua Aquitanica' (1877), he published a comprehensive work on the Gascon dialects, 'Études sur les Idiomes pyrénéens de la Région française' (1879), crowned by the Academy, and several historical narratives, such as 'Institutions monarchiques de la France sous les premiers Capétiens' (1884), and 'Les Communes françaises à l'Époque des Capétiens directs' (1890).

Lucian, lû'shî-ân, Greek author: b. Samosata, Syria, about 125 A.D.; d. Egypt toward the close of the 2d century A.D. He went to Antioch and devoted himself first to the law and afterward to rhetoric, and traveled in several countries (among others, Greece, Italy, Spain, and Gaul) as a lecturer. On returning home, probably about his 40th year, he abandoned the profession of rhetoric, which he seems partially to have resumed in his old age, and confined himself to philosophy and literature. He lived to an advanced age, and was at a late period of his life made procurator of part of Egypt. The works of Lucian, of which many have come down to us, are narrative, rhetorical, critical, satirical, mostly in the form of dialogues. The most popular are those specifically known as the 'Dialogues,' in which he derides the popular mythology and the philosophical secrets, particularly his 'Dialogues of the Gods' and 'Of the Dead.' These have given him the character of the wittiest of ancient writers. He seems not to belong to any system, but attacks imposture and superstition freely and boldly where he finds them. The Epicureans, who, in this respect, agree with him, are therefore treated with more forbearance. The Christian religion, of which, however, he knew little, and that only

through the medium of mysticism, was an object of his ridicule. His writings were once largely studied as text-books, but his diction is not of the best. Among editions of his works may be mentioned Lehmann's (1822-9), F. Fritsch's (1882-5), incomplete; and Sommerbrodt's (1886-99). The most complete English translation is by Howard Williams (1888, in Bohn's series), and there are also renderings by Franklin (1781) and Tooke. Consult: Croiset, 'Essai sur la Vie et les Œuvres de Lucien' (1882).

Lucifer, lû'sî-fêr, (1) in ancient astronomy, the morning star. A name given to the planet Venus when she appears in the morning before sunrise. When Venus follows the sun, or appears in the evening, she is called Hesperus, the evening star; (2) a name commonly given to Satan, the prince of darkness; (3) a term originally applied to matches tipped with a mixture of chlorate of potash and sulphuret of antimony, which were inflamed by friction on a piece of emery paper. These have been superseded by a variety of mixtures containing phosphorus.

Luciæ, lû-sî'fê, or **Esocidæ**, the pike and pickerel family of bony fishes. These fishes have an elongated, somewhat compressed, powerful body, with rather small cycloid scales, an imperfect lateral line; the head and snout prolonged and depressed, the mouth large, and lower jaw longest. The mouth is filled with strong teeth, and these fishes are the fiercest carnivores of the fresh waters. The family is widely distributed in Northern waters, and may be traced back to the Miocene Age. See PIKE.

Lucile, lû-sêl', an epic poem by Lord Lytton (q.v.) (Owen Meredith) published in 1860. The narrative was founded upon a French novel.

Lucilius, lû-sîl'î-ûs, **Gaius**, Roman author: b. Suessa 180 B.C.; d. Naples 103 B.C. He was grand-uncle to Pompey the Great on the maternal side. He served his first campaign against Numantia under Scipio Africanus, with whom he was very intimate. He is considered the inventor of the Roman *satira*, because he first gave it the form under which this kind of poetry was carried to perfection by Horace, Juvenal, and Persius. His satires were superior, indeed, to the rude productions of Ennius and Pacuvius, but he in turn was surpassed by those who followed him. Horace compares him to a river which carries along precious dust mixed with useless rubbish. Of thirty books of satires which he wrote only 940 fragments have been preserved. In his lifetime these satires had an uncommon popularity. Consult the edition by Lachmann and Vahlen (1876); also Müller, 'Leben und Werke des Gaius Lucilius' (1876).

Lucina, lû-sî'nâ, in Roman mythology, the goddess of light, a surname of Juno (according to some of Diana; according to others the name of a daughter of Jupiter and Juno), derived from the root of *luceo* (I shine). Her festival was celebrated 1 March, on which occasion the matrons assembled in her temple, adorned it with flowers, and implored a happy and brave posterity.

Lucius, lû'shî-ûs, the name of three popes, as follows:

Lucius I.: d. March 254. He succeeded Pope Cornelius on 23 June and by some authori-

ties is said to have suffered martyrdom under Gallus, but this cannot be proved.

Lucius II. (GHERARDO CACCIANEMICI, gār-rārdō kā'chē-ā-nā-mē'chē): d. 15 Feb. 1145. He was legate to Germany from Honorius II., supported Innocent II. against the antipope, Anacletus II., and became chancellor of the Holy See. In 1144 he succeeded Celestine II., but was unsuccessful in quelling revolts against the papal authority in Rome and while heading his troops to suppress a disturbance, was killed by a paving stone thrown from the mob.

Lucius III. (UBALDO ALLUCINGOLI, oo-bāl'dō āl-loo-chēn'gō-lē): d. Verona 25 Nov. 1185. He was the cardinal-bishop of Ostia and became pope 1 Sept. 1181. He was the first pope elected solely by the cardinals. The emperor Frederick Barbarossa having claimed the estates bequeathed to the papacy by Matilda of Tuscany, Lucius demanded their surrender. Frederick refused and the quarrel ended in the expulsion of Lucius from Rome. He died an exile in Verona.

Luck of Edenhall, The. See EDENHALL.

Luck of Roaring Camp, The, a celebrated short story of California mining life written by F. Bret Harte (q.v.), which was first published in the 'Overland Monthly' in 1869. The story attracted attention in the East and appeared in book form the following year. It is perhaps the most notable of the many short stories of Western life written by this author.

Lucknow, India, the capital of Oudh, 580 miles northwest of Calcutta, on both banks of the Gumti, here spanned by two native and two British built bridges. The city is connected by the Oudh and Rohilkund line with the general Indian railway system. Lucknow has an imposing appearance at a distance which a nearer view fails to realize. The principal buildings are: the Kaiserbagh palace, built in 1850, now occupied as government offices and forming a gorgeous pile of domes, pinnacles, terraces and fountains; the Imāmbara or holy place, where Asuf ud Douelah is buried, now an arsenal; the great mosque or Jama Masjid; and the Hoseinalad or small Imāmbara with the mausoleum of Mohammed Ali. The Martinière College for half-caste children is a striking building founded by Claude Martin, a French soldier who became a general in the East India Company; other educational institutions include Canning College and several English schools, libraries and mission churches. Lucknow was one of the chief seats of the Indian Mutiny (q.v.) and the residency, the Secunder Bagh, and the Alumbagh where Havelock is buried are reminiscences of the siege. Pop. (1901) 264,049. Consult: Innes, 'Lucknow and Oudh in the Mutiny' (1895).

Luckock, Herbert Mortimer, English clergyman: b. Great Barr, Staffordshire, 11 July 1833. He was graduated from Jesus College, Cambridge, was twice vicar of All Saints, Cambridge, and was rector of Gayhurst and Stoke Goldington. Subsequently he was residentiary canon of Ely and principal of the Ely Theological College, and in 1892 became dean of Lichfield. Among his writings are: 'Tables of Stone'; 'The Intermediate State'; 'Footprints of the Apostles'; and 'Old and New Testament Sermons.'

Lucretia, lū-kre'shī-ā, Roman matron of distinguished virtue, whose ill-treatment by Sex-

tus Tarquin led to the destruction of the kingdom, and the formation of the republic of Rome. She was the wife of Collatinus, a near relation of Tarquin, king of Rome. Sextus Tarquinius, who contrived to become a guest in the absence of her husband, whose kinsman he was, found means to reach her chamber in the middle of the night, and threatened, unless she gratified his desires, to stab her, kill a slave, place him by her side, and then swear that he had slain them both in the act of adultery. The fear of infamy succeeded. She afterward summoned her husband, father, and kindred, and after acquainting them with the affair stabbed herself to the heart. The story has been variously adapted by poets and romancers.

Lucretius, lū-kre'shī-ūs, **Carus Titus,** Roman author: b. probably 97 B.C.; d. 53 B.C. About his life almost nothing is known. He is supposed to have studied Epicurean philosophy at Athens. He is said to have been made insane by a philtre, in his lucid intervals to have produced several works, and to have committed suicide in his 44th year. We possess of his composition a didactic poem, in six books, the 'De Rerum Natura,' in which he exhibits the cosmical principles of the Epicurean philosophy with an original imagination, and in forcible language. The work is in six books, revised by Cicero, and is entire but, evidently, not complete. The theory of corpuscles and their properties; the origin of the vital and intellectual principles; of the senses; of the world and the movements of the heavenly bodies; of the rise and progress of society; and of arts and sciences, with other expositions of natural phenomena, are successively treated. Lucretius' purpose was to free his readers from the fear of death which he believed to be bound up with the superstitions of the popular religion. As a work of art his poem has received the unanimous praise of critics for the skill with which the most unyielding materials are reduced to a poetic diction full of life and sustained majesty. It has influenced the foremost English poets. (See Tennyson's poem 'Lucretius'). The principal editions are those of Lachmann (3d edition, Berlin, 1866), and Munro, with an English translation (3 vols.; revised edition by Duff, 1886). The poem has also been translated into English by Creech, Busby, and Good.

Lucullus, lū-kūl'ūs, **Lucius Licinius,** Roman soldier of the 1st century B.C. When a young man he served with distinction in the Marsic war, and accompanied Sulla as questor into Asia on the breaking out of the Mithridatic war, 88 B.C. He expelled Mithridates from Chios and Colophon and defeated him off Tenedos. After peace had been concluded with Mithridates he remained in Asia till 80 B.C. In 79 he was elected curule ædile, an office which he held in conjunction with his younger brother. Subsequently he held the office of prætor. On the conclusion of this magistracy he went to Africa, the administration of which province he conducted with ability and impartiality, and in 74 B.C. obtained the consulship with M. Aurelius Cotta. As consul he maintained the constitutional laws of Sulla. On the breaking out of the war with Mithridates he obtained the proconsulship of Cilicia and the command of the army. He vanquished the squadron of Mithridates near the island of Lemnos, and this victory enabled

him to drive all the other squadrons of Mithridates from the Archipelago. The generals of Lucullus subdued meanwhile all Bithynia and Paphlagonia. Lucullus, again at the head of his army, although overcome by Mithridates in a battle, soon acquired such advantages that he finally broke up the hostile army, and Mithridates himself sought protection in Armenia. Lucullus now changed Pontus into a Roman province. Tigranes, king of Armenia, refusing to surrender Mithridates to the Romans, Lucullus marched against Armenia and vanquished Tigranes 69-8 B.C. Mithridates, however, contended with varying fortune, till Lucullus was prevented from effectively continuing the war by the mutiny of his soldiers. Lucullus was deprived of the chief command, which was bestowed first on Glabrio, and afterward on Pompey, and recalled 66 B.C. After a delay of three years he succeeded in procuring the merited recognition of his services in a public triumph. He laid out his gardens at Rome with such splendour that they became proverbial, and Pompey called him the Roman Xerxes.

Lucy, Henry W., English journalist: b. Crosby, near Liverpool, 5 Dec. 1845. He was for a time a member of the *Shrewsbury Chronicle* staff; in 1870-3 was connected with the *Pall Mall Gazette* (morning edition); and from 1873 with the *Daily News*, of which—with the exception of the period January 1886-July 1887, when he was editor-in-chief—he was the parliamentary correspondent. He visited the United States in 1883, on his way around the world; an account of which journey appeared in the *New York Tribune* in the form of letters, subsequently collected as 'East by West' (1885). On the death of Tom Taylor (q.v.) Lucy continued the former's 'Essence of Parliament' in *Punch* as 'The Diary of Toby, M. P.' Among his books are 'Men and Manners in Parliament' (1874); 'A Diary of Two Parliaments' (1885-6), and 'Gladstone' (1896).

Lucy, Sir Thomas, English landed proprietor: b. 1532; d. Charlecote 7 July 1600. He was educated by John Foxe (q.v.), the famous martyrologist; and he followed the Puritan sentiments of his tutor. In 1552 he came into possession of great estates in Warwickshire, in 1558-9 rebuilt the manor-house, which still exists, an excellent specimen of the Tudor style. He was knighted in 1565, and elected M. P. for Warwick in 1571 and 1584. His chief interest is in his alleged connection with Shakespeare (q.v.) whom he is said, in a story dating from the 17th century, to have prosecuted for deer-stealing. This story is now thought to be based on fact, though burdened with false details; and Shakespeare is believed undoubtedly to satirize him as Justice Shallow in 'The Merry Wives of Windsor.'

Lud'dites, in British history, a name given to rioters in 1811-16, in Yorkshire, Lancashire, and Nottinghamshire, in England, who attributed the prevailing distress to the introduction of machinery in manufactures, and did a great deal of damage in destroying it. For a time these counties were in a perpetual state of disturbance, but on the return of prosperity the riots ceased.

Lud'ington, Mich., city, county-seat of Mason County; on Lake Michigan and Mar-

quette River. It is the terminus of the Pere Marquette railroad; about 85 miles northeast of Milwaukee, Wis., 130 miles northwest of Lansing, the capital of Michigan, and 61 miles from Manitowoc on the opposite side of the lake. It has regular steamer communication with the large ports on Lake Michigan, and direct freight connection, by ferry, with Manitowoc, Wis. It was settled in 1851, incorporated in 1867, and chartered as a city in 1874. The principal industries are connected with the manufacture and shipment of lumber. There are large lumber mills, game-board factories, furniture and clothes-pin factories. Lumber, grain, flour, salt, and fruit are among the articles shipped to outside markets. The city has many guests in the summer months, attracted by the cool climate and opportunities for fishing in the several lakes nearby. The Epworth League Training Assembly has nearby grounds and cottages. Pop. (1900) 7,166.

CHARLES T. SAWYER.

Ludlow, lüd'lō, Edmund, English leader of the Republican party in the civil wars of Charles I.: b. Maiden Bradley, Wiltshire, about 1617; d. Vevay, Switzerland, 1692. He was graduated from Trinity College, Oxford, in 1636; fought at Edgehill in 1642; in 1646 was elected to Parliament from Wiltshire; and in December 1648 was one of the chief promoters of 'Pride's purge' (q.v.). He was one of the judges who signed the death-warrant of Charles I., sat in the council of state in 1649-50, and was lieutenant-general of the horse in Ireland and a commissioner for the civil government of that country in 1650-5. In 1656, upon the proclamation of Cromwell as lord protector, he declined to recognize Cromwell's authority, or to give security to keep the peace. Having been allowed to go into retirement in Essex, he was elected to Parliament for Hindon in 1659, and upon the recall of the Long Parliament became a member of the committee of safety (7 May), of the council of state (14 May), and commander-in-chief of the Irish army, with rank of lieutenant-general (4 July). He was impeached upon the Restoration (1660), surrendered, was allowed his liberty on providing sureties, and escaped to Switzerland. His 'Memoirs' (1698-9) furnish a good account of the opposition to Cromwell and of the factional troubles which overthrew the republic.

Ludlow, Fitzhugh, American journalist: b. Poughkeepsie, N. Y., 11 Sept. 1836; d. Geneva, Switzerland, 12 Sept. 1870. He was graduated from Union College in 1856, in 1858-9 studied law in New York, in 1859 was admitted to the bar, but from 1860 devoted himself exclusively to literature. In 1860-1 he was connected with the *World* and the *Commercial Advertiser*, for a time was dramatic, art and musical critic of the *Evening Post*, to which he long contributed, and held a similar post as critic on the 'Home Journal.' In 1863 he journeyed across the plains to Oregon and California, and in an article styled 'Through Tickets to San Francisco,' laid out a route for a Pacific railroad largely identical with that later followed. He was among the earliest contributors to 'Northern Lights' of Boston, upon the establishment of that magazine. Among his works are: 'The Hasheesh Eater: Being Passages from the Life of a Pythagorean' (1857); 'Little Brother and Other Genre Pictures' (1867); 'The Opium Habit' (1868); and

'The Heart of the Continent: A Record of Travel' (1870).

Ludlow, James Meeker, American Presbyterian clergyman and author; b. Elizabeth, N. J., 15 March 1841. He was graduated from Princeton in 1861, from the Princeton Theological Seminary in 1864, entered the Presbyterian ministry and was pastor of the First Presbyterian Church of Albany 1864-8, and of the Collegiate Reformed Church of New York in 1868-77. His subsequent pastorates were that of Westminster Church, Brooklyn, N. Y., (1877-85) and that of the First Presbyterian Church of East Orange, N. J. (from 1886). In 1885 he declined the presidency of Marietta College (Ohio). His works are: 'My Saint John' (1883); 'Concentric Chart of History' (1885); 'The Captain of the Janizaries' (1886); 'A King of Tyre' (1891); 'That Angelic Woman' (1893); 'History of the Crusades' (1896); and 'Baritone's Parish' (1897).

Ludlow, John Malcolm, English author; b. Nimach, India, 8 March 1821. He was educated at the College Bourbon, Paris, became a barrister of Lincoln's Inn, London, in 1843, and practised as a conveyancer till 1874. He was chief registrar of Friendly Societies, 1874-91, and has published 'Letters on the Criminal Code' (1847); 'The Master Engineers and Their Workmen' (1852); 'British India: Its Races and Its History' (1852); 'Thoughts on the Policy of the Crown Toward India' (1859); 'Sketch of the History of the United States from Independence to Secession' (1862); 'President Lincoln Self-Portrayed' (1866); 'The War of American Independence' (1876); etc.

Ludlow, Roger, American colonial statesman; b. Dorchester, England, 7 March 1590; d. Virginia about 1665. He was by profession a lawyer, came to Boston in 1630, was there assistant to the general court of Massachusetts in 1630-4, in 1634 became deputy governor, but was defeated for the post of governor, removed with a Massachusetts colony to Windsor, Conn., and was, it is thought, the first practising lawyer in Connecticut. In 1639 he was a member of the convention for preparing a constitution, and the document is believed to have been drafted by him. In Connecticut also he was made deputy governor, and here, too, John Haynes, who had defeated him for the governorship in Massachusetts, was again victorious in the gubernatorial election. In chagrin Ludlow sought to evade his "evil genius," as he styled Haynes, by founding the town of Fairfield. Here he held each public office of any importance, was a commissioner to the New England congress, and revised the laws of Connecticut (1672). The Manhadso Indians having threatened Fairfield, the citizens declared war against the Dutch, at whose instigation the savages were believed to be acting; and Ludlow was made captain of the forces. The New Haven general court, however, quashed this proceeding, and punished Ludlow's subordinate officers. Ludlow then (1654) withdrew in high dudgeon with all the town records to Virginia, where he quite disappeared.

Ludlow, William, American soldier; b. Islip, Long Island, N. Y., 27 Nov. 1843; d. Convent, N. J., 30 Aug. 1901. He was graduated from West Point in 1864, entered the engineer service, was chief engineer of the 20th corps in the Georgia campaign (July-September, 1864),

in 1864-5 was engineer of the army in Georgia, was assistant engineer on Sherman's staff in the "March to the Sea" and in the Carolinas, and 13 March 1865 was brevetted lieutenant-colonel, U. S. A., for meritorious conduct in the Carolinas campaign. After various service, he was chief engineer of the department of Dakota in 1872-6, engineer in charge of the Delaware River and harbor improvements and defenses in 1882-3, by authority of Congress chief engineer of the Philadelphia water department in 1883-6, and was at different times in charge of lighthouse districts and engineering work. In 1895 he became president of the Nicaragua canal commission and 13 August was promoted lieutenant-colonel of engineers in command of the lighthouse depot. Commissioned brigadier-general of volunteers 4 May 1898, he became engineer-in-chief of the American army in the field in the Spanish-American war, served in the Santiago campaign, was made major-general of volunteers 7 Sept. 1898, and from 13 Dec. 1898 to April 1900 was military governor of Havana, in the rehabilitation of which city he took an important part. On 13 April 1899, he became brigadier-general of United States volunteers, and on 21 Jan. 1900 brigadier-general United States army. As president of the board of officers appointed for the consideration of the establishment of an army war college, he visited France and Germany for purposes of study. In 1901 he was ordered to the Philippines as commander of the department of Visayas, but immediately returned on sick-leave. He wrote: 'Explorations of the Black Hills and Yellowstone Country'; and 'Report of the United States Nicaraguan Canal Commission.'

Ludwig Salvator von Toscana, lood'v'ig sál-vä'tör fön tós-kä'nä, ARCHDUKE OF AUSTRIA, Austrian traveler; b. Florence 4 Aug. 1847. He was the son of Leopold II., Grand Duke of Tuscany. His principal writings, all illustrated by himself and most of them published anonymously, are: 'Levkosia, Capital of Cyprus' (1873); 'Yacht Voyage to the Syrtes' (1874); 'Los Angeles in Southern California' (2d ed. 1885); 'The Caravan Route from Egypt to Syria' (1878); 'The Balearic Islands,' superbly illustrated (7 vols., 1869-91); 'Around the World without Intending It' (4th ed. 1886); 'Paros and Antiparos' (1887); 'The Lipari Islands' (1893).

Lufft, Hans, hänts looft, German printer and publisher; b. 1495; d. 1584. He printed the first complete edition of Luther's Bible, at Wittenberg, in 1534. He also printed other works of Luther, and more than 100,000 copies of the Bible were issued from his press. See LOTTER FAMILY.

Lugano, loo-gä'nö, Switzerland, town, in the canton of Ticino, on the north shore of Lake of Lugano; about 15 miles northwest of Lake Como. Its principal edifices are several churches, one, Santa Maria degli Angioli, contains a fresco of the "Passion," by Bernardino Luini, convents, a hospital, and a theatre. The manufactures are chiefly spun silk and silk goods. The transit trade is considerable. Till 1881 it was, alternately with Locarno and Bellinzona, the seat of the legislature of the canton of Ticino. Pop. 10,000.

Lugano, Lake of (Latin, *Ceresius Lacus*), is partly in the Swiss canton Ticino and partly

in Italy; between Lakes Como and Maggiore, into the latter of which it discharges its waters. It is of very irregular shape, a narrow body which throws out arms in all directions. Its length is about 20 miles, its breadth about one and one-half, and its depth about 300 feet. Its scenery is very wild and beautiful.

Lug'ger, the former name for a small vessel not unlike the schooner of the present day; having two or more lug-sails, that is fore-and-aft sails set on one yard hung obliquely to the mast at one-third its length.

Lug'worm, or **Lobworm**, a marine annelid (*Arenicola piscatorum*), dwelling in burrows on sandy beaches of the European coast, and in Great Britain much used as bait by anglers.

Luini, Bernardino, bër-nâr-dē'nō loo-ē'nē, Italian painter: b. Luino, on the Lago Maggiore, between 1475 and 1480; d. soon after 1533. He was perhaps the most distinguished representative of the Milanese school, and between 1500 and 1533 was active as a fresco and easel painter in Milan and other places of northern Italy. He began his studies as the pupil of Ambrogio Voriggione, whose influence is plainly seen in his 'Pietà' in the church of Santa Maria della Passione at Milan, though the blandness and delicacy of the early Milanese school is in his work somewhat animated and vitalized by the spirit he derived from the study of Leonardo da Vinci, under whose name some of his ripier work has frequently gone. But though his frescoes are full of spiritual faces, and distinguished by the tenderest coloring, and the most lifelike movement, he never quite made his own the grandeur in composition and passionate energy which distinguish the paintings of Leonardo. Most of his productions are found in Upper Italy. Many of his easel pictures are to be seen in the Ambrosiana (library), Brera (palace), and in private galleries at Milan; others in the cathedral at Legnano. In the Uffizi at Florence is his 'Beheading of John Baptist.' His chief work is 'The Enthroned Madonna with Saint Anthony and Saint Barbara' (1521), a magnificent fresco in the Brera. Other examples of this painter are now in the Palazzo Sciarra at Rome, as well as in the Louvre, the National Gallery of London, and the Berlin Museum.

Luise, loo-ē'zē, **Auguste Wilhelmine Amalie**, queen of Prussia: b. Hanover 10 March 1776; d. Strelitz 19 July 1810. She lost her mother in her 6th year and was brought up in charge of her grandmother at Darmstadt. In her 17th year she was married to the crown prince, afterward Frederick William III., of Prussia. On her husband's accession to the throne she won all hearts by her beauty, gracefulness, and kindness of disposition. Her highest happiness was found in her husband and children, but she was also a queen who has left a deep impression on the annals of the Prussian court. In her travels with the king through the provinces she was constantly engaged in helping the poor and unhappy. When the war of 1806 broke out she accompanied her husband to Raumburg and, after the disaster of Jena, to Königsberg and Memel, setting an example to all by her unbroken fortitude. Before Tilsit she hoped to win from Napoleon more favorable conditions for her beloved country, and inter-

ceded with the conqueror in vain. She is a household name to this day in Prussia, and the Order of Luise was founded in her honor by her husband, the king, 3 Aug. 1814. It is the object of this order to honor patriotic and benevolent women of the Prussian nation. The badge is a gold cross enameled in black. In the centre is a shield of blue on which the letter L is enclosed in a circle of stars. The ribbon is white, striped with black. Consult: Hudson, 'Life and Times of Louisa, Queen of Prussia' (1874); and Adami, 'Luise, Königin von Preussen' (1888).

Luke, Saint, author of the third gospel, and the Acts of the Apostles. His place and date of birth are equally unknown, but it is certain from Col. iv. 11 as compared with 14, that he was a Gentile. Eusebius calls him a native of Antioch, but there is no authentic evidence of this. He was a physician, and his works show him to have been an educated man, with a literary style distinctive and often pregnant and picturesque. He possessed a wide acquaintance with eastern Mediterranean places, their customs, forms of worship, and typical characteristics. Tradition asserts that he was a painter, but this may be merely a fanciful tribute to the manner in which he groups and sets off the incidents of his Gospel with an almost pictorial coloring and a symmetry which show true artistic sense of proportion. According to the Acts of the Apostles he appears as the companion of St. Paul from Troas to Philippi, and some have supposed that his services as a physician were needed by St. Paul, whose frequent sicknesses are alluded to in his epistles. He probably remained at Philippi, the key to Europe in the Apostolic programme, from 52 to 58, and rejoining St. Paul there was his companion till the narrative of his journeys comes to an end. He was most likely in Palestine during St. Paul's imprisonment at Cæsarea (58-63), and then made his researches into the Gospel history (Luke i. 1-4). As he was not an eye witness of Christ's life, he cannot have been one of the seventy, as Epiphanius of Salamis supposes. Of his life after the death of St. Paul absolutely nothing is recorded. We know from the epistles of St. Paul that he was with that apostle during the latter's imprisonment in the Mamertine prison at Rome, from which his leader went forth to martyrdom. In art he is represented with an ox lying near him, and this beast of sacrifice is sometimes called his emblem; or as painting the portrait of the Virgin, or surrounded by the implements of the painter, or robed like a learned physician. According to some records he preached in Bithynia, and St. Jerome says he lived to the age of 84. See **GOSPELS**; **ACTS OF THE APOSTLES**.

Luke, Gospel of. See **GOSPELS**.

Luke of Leyden (**LUCAS VAN LEYDEN**, properly **LUCAS JACOBZ**), one of the founders of the Dutch school of painting: b. Leyden, 1494; d. there 1533. In earlier life he was taught painting by his father, Huig Jacobsz, and afterward by Cornelius Engelbrechten. At 9 he began to engrave, and in his 12th year astonished all judges by a painting, in water-colors, of St. Hubert. In his 15th year he produced several pieces, composed and engraved by himself, among which the 'Temptation of St. Anthony,' and the 'Conversion of St. Paul,' in regard to

LULLY—LUMBER INDUSTRY IN THE UNITED STATES

composition, characteristic expression, drapery, and management of the graver, are models. After this he executed many paintings in oil, water-colors, and on glass; likewise a multitude of engravings, which spread his fame widely. He formed a friendly intimacy with the celebrated John of Mabuse and Albert Dürer, who visited him in Leyden. His overwork at last resulted in hypochondria and he imagined himself poisoned by envious painters, and hardly left his bed for the last six years of his life. The fullest and most beautiful collection of engravings by this master is in the library at Vienna. His paintings are scattered through the galleries of London, Berlin, Rome, as well as in Holland, where is his masterpiece, 'Mount Calvary,' a composition containing some 80 figures.

Lully, lül'í, Lull, or Lul, Raimon (DOCTOR ILLUMINATUS), Spanish scholastic: b. Palma, Majorca, 1235; d. at sea in sight of Palma 1315. After having been attached to the court of James I. of Aragon, he retired to a cell on his estate, where he lived as an ascetic. Encouraged by visions, he came to believe himself appointed to refute Mohammed and convert the Moslems to Christianity, and studied Latin, Arabic, and logic in preparation for this work. His 'Ars Demonstrativa Veritatis' was devised as an infallible and universal logical method to be used in making conversions, for the purpose of proving that the mysteries of faith were not contrary to reason. Lully believed that his method was destined to supplant the scholastic logic of the Middle Ages. His history now becomes a record of ceaseless travel. He endeavored without success to obtain aid from Pope Nicholas in establishing colleges for the study of Oriental languages. The Ars Lulliana consists mainly in categorizing ideas and combining them mechanically, by which means Lully thought to exhaust their possible combinations. The method was taught and commented on in some schools of little influence in Spain, France, and Italy, but it is hardly necessary to say that it never took root or produced any direct effects. Lully's works are very numerous. A collected edition is that begun by Galizinger (1521-42); Vols. VII, and VIII, never published). Consult: Erdmann, 'Grundriss der Geschichte der Philosophie' (2d ed. 1869).

Lumba'go (from Latin *lumbus*, loin), a painful affection of the muscles and tendinous attachments of the lumbar region. See RHEUMATISM.

Lumber Industry in the United States. The history of the lumber industry of the United States began at the landing of the first colonists in Massachusetts, Virginia and Georgia. Loghouses sheltered the early settlers. Planks were split from logs and dressed by axes. At length pit sawing, a hand operation, became the initiative of the great saw-mill industry. As population increased and the demand for building material developed the inventive genius and energy of the people evolved the saw mill, which was run by water power. Subsequently came the steam mill. In the progress of events the evolution, starting from the old sash and muley mill, with a capacity of 6,000 to 10,000 feet a day, has attained to the modern one of 100,000 and even 350,000 feet capacity, in some notable instances. During the 283 years since the Pil-

grims landed at Plymouth Rock the lumber industry of the United States and Canada has grown to a production of probably 1,000,000,000 feet, board measure. In but three States—Michigan, Wisconsin and Minnesota—according to best available statistics, the production of pine lumber from 1830 to 1897 amounted to 286,000,000,000 feet, to which can be added 75,000,000,000 of hard woods, making a grand total of 363,000,000,000 feet, the valuation of which has been computed at \$5,250,000,000.

The early development of lumber manufacture of course occurred in that narrow fringe of Atlantic coast country first settled by emigrants from Europe. They found the entire country heavily wooded. White pine abounded in the New England States and pitch pine in Virginia, the Carolinas and Georgia. The most stupendous growth of the lumber industry has involved white or soft pine, since it abounded from Maine westward to beyond the Mississippi, in the States wherein the most rapid growth of population, settlement of new territory, the elaboration of internal improvements, and development of transportation facilities have occurred. In the early history of the country the people chose white pine for structural purposes because of its abundance and availability. Other woods were used, but the main supply of lumber was derived from pine. In New England and the Middle States, however, the industry was largely local, the lumber produced being mainly devoted to the erection of farm and village structures in the immediate vicinity of the mills, all of which were small. As such cities as Boston, New York and the lesser ones grew up along the coast a market for a large product was developed. There was also a demand for ship-building, and at length for shipment to the West Indies and other foreign parts. The coast trade began to be largely supplied from Maine, which came to be known as the Pine Tree State. Logs reached the mills by floatage down the rivers. It was in Maine that the white pine lumber industry became of great commercial importance, and the evolution of the saw-mill began. Along the Canadian border of Vermont and New York, likewise, there was notable development of the white pine business from about 1800 to 1830. Large quantities of pine were yearly cut and floated down Lake Champlain and the Sorel river into the Saint Lawrence, and thence to Quebec for shipment foreign.

About the time this pine was exhausted and that of Maine and New Hampshire was beginning to approach exhaustion the great West began to attract settlers. The opening up of the prairie States induced a demand for lumber, and the white pine industry of Michigan and Wisconsin naturally arose. It seems as if there was a divine purpose in planting the immense pine forests contiguous to the Great Lakes, which provided for transportation, and to the prairie country, which furnished a market for lumber and timber. By the influences of supply and demand the pine product of Michigan, Wisconsin and Minnesota rose to its maximum in 1890, when the total output was 8,597,623,000 feet. The earliest statistical record was made in 1873, when the total amounted to 3,993,780,000 feet. The totals did not materially vary until 1879, when the aggregate product swelled to 4,806,943,000 feet. The yearly output tended upward, with some annual depressions, until the highest mark

A GIANT RAFT ON THE COLUMBIA RIVER, BOUND FOR SAN FRANCISCO.

THE EMPTY "CRADLE" FOR BUILDING A GIANT RAFT ON THE COLUMBIA RIVER,
NEAR ASTORIA

LUMBER INDUSTRY IN THE UNITED STATES

was reached in 1890. A positive decline in total product was noticeable in 1894, and it was gradual, with some fluctuations, until 1902, when the total had dropped to 5,294,395,000 feet, figures which still represent an enormous amount of lumber. The development of the prairie States, the rapid increase in population and wealth, the building of thousands of miles of railroad and the magical growth of cities, including Chicago, all caused a demand for lumber of a rapidly swelling volume unprecedented in the history of the world. Hence we have a forest product swelling in two decades nearly 300 per cent and reaching a value in one year of at least \$85,976,230.

The declension of the annual product of white pine and its consort, Norway pine, has been marked since 1896, and never again in one year can the production reach the total of 1890, or even of the later one in 1895, when the output was 7,050,669,235 feet. The pine supply of the lower peninsula of Michigan is verging toward exhaustion, that of the once prolific Menominee district in upper Michigan and Wisconsin is long past its zenith, the Wolf river district in Wisconsin turns out but a few million feet of logs annually, while the same is true of the Black River and other streams in that State. More than four fifths of the total product of the three States is now turned out from the western two thirds of Wisconsin and Minnesota. This territory produced 4,328,930,000 feet of a total for the three States named of 5,294,395,000 feet. The diminishment of the white and Norway pine supply of the North would have been an unmitigable calamity if compensation had not resulted from the growth within recent years of the yellow pine product of the South. This began to be manifest in the lumber trade of the Middle West early in the '80s of the last century. But before this, and beginning with the early settlement of the Atlantic coast colonies, the pitch pine of Virginia, North Carolina, South Carolina, Georgia and Florida held a relation in respect to consumption like white pine in the North. It entered into the local supply for building material, and as the cities grew and coastwise and foreign commerce increased, the pine of the southern coast was used for building of houses and ships, and was sent to foreign lands. In time the product of the mills was shipped by sea to New York, Baltimore, Philadelphia, Boston and other ports. For many years the flooring manufactured from Georgia pine has been a favorite in the northeastern States. The export of pitch pine, or yellow pine, timber from the southern coast has built up such important shipping points as Pensacola, Mobile, Fernandina, Jacksonville, Savannah, Wilmington and Norfolk. Yet it remained for a later time to develop a vast interior demand for the yellow pine of Georgia, Alabama, Mississippi, Louisiana, Arkansas and Texas. The promotion of this growth arose from the decline in the supply of northern pine already referred to, which was seen to be imminent early in 1900. Ten years before that efforts had been made in Mississippi, Arkansas and Texas to push yellow pine as a competitor in middle western markets, with varying success. More rapid progress was made from 1890 forward and still greater from 1901 to 1903. Lumbermen and capital from the old pine States of the North were attracted to the southern field, many new and

modern mills were built, and railways were constructed for hauling logs from the forests to the mills. In the meantime the total northern pine supply in the three main producing States had declined from 8,597,623,000 feet in 1890 to 5,294,395,000 in 1902. This gave yellow pine opportunity to pass into the vacuum caused by the shrinkage of northern product. The longleaf pine of the gulf section, from Georgia to Texas, was admirably adapted to conversion into bridge, railroad and building timber, car sills and other parts of car building, as well as to flooring and interior finish. The shortleaf pine, while not so much in request for the heavier forms of construction, was much sought after for the lighter frames of buildings and all interior and exterior work. It was peculiarly adapted to enter into a various manufacture, especially of doors, sash, interior trim, etc. The remarkable development of Kansas, Nebraska, Indian Territory, Texas and Oklahoma has given an impetus to yellow pine manufacture and distribution in the southwest. At the same time Mexico has increasingly drawn upon the supply, and the South American, West Indian, South African and European demand is an important feature of the trade in localities convenient to Gulf and Atlantic ports. As the northern pine supply diminishes, the main lumber resource of the country east of the Missouri River will be the yellow pine of the South. Included in the whole will be the longleaf, shortleaf, loblolly, Cuban and North Carolina varieties. The United States census estimates from obtainable data that the yellow pine forests of the South cover approximately 150,000 square miles, or 100,000,000 acres. The average stand per acre is estimated at 3,000 feet, board measure, thus giving a total of 300,000,000,000 feet. The cut in the census year 1900 was made out to be 8,523,000,000 feet, or 3 per cent of the estimated stand. If the estimate of the total stand is approximately correct there was enough in 1900 to supply the annual cut, at the rate in that year, for 33 years, without allowing anything for growth in the interval.

Another factor within recent years has been thrust into the lumber supply of the United States; this is lumber from the Pacific coast States, with an appreciable quantity from Idaho, Montana, Arizona, New Mexico, Colorado and Wyoming. The prominent features of this far western supply are the fir, cedar, spruce and hemlock of Washington and Oregon, and the redwood, sugar and white pine of California. Fir and redwood are the leaders in Pacific coast lumber resources. Before the building of the transcontinental railways the consumptive demand of the Pacific States and the export trade were the only outlets for mill product. For many years after the Union Pacific, the Southern Pacific and the Northern Pacific railroads were opened to traffic west coast lumber made but little progress in the East. In the eighth decade of the last century attempts were made to introduce California redwood of high grade for interior finish and some special cabinet purposes, but high freight rates precluded much use of such lumber. Small amounts reached the Atlantic coast cities by sea. At about the same period, though somewhat later in the decade, fir timber from Washington was sent into the Middle West to be used where especially long and large pieces were required for special work. From these

LUMBER INDUSTRY IN THE UNITED STATES

initiatives the trade in redwood and fir made slow and irregular progress until about 1900, when the declining supply of white pine and advancing prices therefor turned the attention of manufacturers of doors and sash to the consumption of California sugar pine and white pine in their industry. Idaho pine was also exploited in the same connection. Redwood also began to receive more attention in the country east of the Rocky Mountains. Increased energy was given to the pushing of Pacific Coast lumber of all sorts in the eastern and middle portions of the country by the capital and enterprise of lumbermen of the old pine States who had begun to operate in the newer fields on the Pacific coast.

The three Pacific coast States, Washington, Oregon and California, contain an estimated one-third of the standing timber of the country—about 660,000,000,000 feet for the three. The timber found in the greatest abundance in these States is fir, red, yellow and white, the last named forming a very small percentage of the whole. Red cedar is found in Washington and Oregon and white cedar in Oregon and California. The various species of the pine are found in eastern Washington, southern Oregon and northern and central California. The fir forests are intermixed with spruce, hemlock and cedar. The growth of the lumber industry on the Pacific coast has been very rapid during the last few years, due to the expansion of trade in the far eastern countries, the opening of the Philippines and a wider distribution abroad. The home consumption has increased steadily and has been a potent factor in the development. Shipments to eastern States have assumed larger proportions and will continue to grow as the forest resources of the older lumber-producing States become exhausted. Fir, which is used for almost every purpose where lumber is desired, and which makes a large percentage of the entire output, comprised nearly two-thirds of the output in 1902, according to the statistics compiled by the 'American Lumberman,' the total being 2,238,962,000 of a grand total of 3,932,364,000 feet, which included the product of Nevada, Idaho and Montana. The remaining product was about evenly divided between spruce, cedar, redwood, sugar pine, white or yellow pine and other soft woods. About the same ratio held good in 1901. None of the Pacific coast States is a heavy producer when the standing timber is taken into consideration with that in the East. Washington, which has an outlet to the East by three railroads, is far in the lead. It also has unexcelled facilities for handling the export trade and the best natural harbors of the world. Oregon practically has only two lines of railroad and only two good harbors, so that the industry in that State has not kept pace with the growth in Washington, although Oregon has more timber than any other State in the Union. In making up the figures for the Pacific Coast, Idaho, Montana and Nevada were included. The report, which was very comprehensive although not entirely complete gave an output of fir of 2,238,962,000 feet in 1902; in 1901, when the report was not so comprehensive, the total was 1,424,097,000; spruce—1902, 242,082,000; 1901, 149,499,000; cedar—234,529,000 in 1902, 138,882,000 in 1901; redwood—317,568,000 in 1902, 119,476,000 in 1901; sugar pine—150,914,000 in 1902, 132,653,000 in 1901; other pine—716,622,000 in 1902, 448,367,000 in 1901; other soft woods—

89,516,000 in 1902, 73,850,000 in 1901; hardwoods—3,330,000 in 1902; 30,600,000 in 1901; shingles—6,297,916,000 in 1902, 3,940,848,000 in 1901.

Comparing the figures compiled by the 'American Lumberman' with the census reports for 1900, a big increase is shown but not all the increase that was made, as the census figures are more complete owing to the facilities at the command of the government for gathering data. These totals compare as follows, the 1902 series of figures being those compiled by the 'American Lumberman' and the 1900 by the census bureau: California, 1902, 829,792,000; 1900, 734,232,000. Oregon, 1902, 915,848,000; 1900, 734,181,000. Washington, 1902, 1,886,087,000; 1900, 1,428,205,000. Fir is the great export timber of Oregon and Washington, and is also used in the manufacture of sash and doors, for car material and for general building purposes. The wants of the world where big timbers are required are pouring in upon the fir manufacturers to be filled. Some of the higher grades of stock are shipped east and large timbers are also going east for special structural work. Timbers have been cut as large as 24 x 24 inches, 120 feet long, but trees capable of producing such lumber are growing scarcer. Red cedar is used mainly for shingles, though of late years mill workers are turning their attention to it and making porch columns, doors, and similar products. The spruce is used as factory stock, for outside finish, moldings and box materials. There are very few paper factories on the west coast as yet. Hemlock is being used to some extent during the last two or three years. Sugar pine is coming into prominence in the East, where there is a good demand for high grade stock among the factories. The lower grades are used for boxes. The other pines are used for a variety of purposes.

Among the problems confronting the manufacturers at the present time is the difficulty in disposing of the lower grades to advantage. Methods of manufacture are getting closer year by year, but there is still a considerable part of the stock wasted, as there is now no avenue through which it can be marketed to advantage. The other pines are used for general building purposes and to a certain extent in the manufacture of boxes. The redwood lumber industry is separate and distinct from the others. Accurate records have been kept from year to year of the output of the mills. The shipments from the mills increased nearly 70 per cent from 1894 to 1902, the figures being 157,544,080 feet in 1894 and 262,597,015 feet in 1902. This year the shipments from the mills will aggregate perhaps 300,000,000 feet. All of the Pacific coast timber country is rough and broken, necessitating expensive methods of logging. In the fir and redwood districts all logging is done by steam, donkey engines being used to drag the logs from where the trees fall to the logging railroad. In the pine districts high wheels are used as a general rule, although the donkey engines are employed to a certain extent. The lumbermen of the Pacific coast have hardly begun their onslaught on the timber. The wood is already being used in appreciable measure to replace the decreased product of the old Northwest and is coming into competition with the yellow pine of the South. The coast States are the coming giants of the lumber trade. The output has

LUMBER INDUSTRY IN THE UNITED STATES

been increasing very fast and it would seem as though it was getting ahead of the demand or that it was growing faster than the markets. This is especially true of the cedar shingle industry, in which the great increase in the production caused values to depreciate in 1903.

The most plebeian of all American lumber woods is hemlock. It is a coarse-grained wood, much given to unsound knots and shape. Its growth is scattered from the north Atlantic coast to Minnesota; it is mostly found among the hardwood growths of the uplands, but sometimes standing in groups and groves on the lower levels bordering swamps. Hemlock is a cheap kind of lumber. It has been used from the earliest days of the republic by the farmers and villagers of the northern tier of States, Pennsylvania and West Virginia, for the building of houses and barns. Within a few years it has been exploited in the lumber trade of Michigan and Wisconsin as a supplement to the diminishing supplies of white and Norway pine. It is distributed in the Middle States and the northerly belt of the Middle Western States, being largely used for framing dimension, and coarse boards, shingles and lath. The total output of hemlock lumber for the United States in 1890 was 3,420,673,000 feet.

Spruce from an early period has furnished the northeastern States a large aggregate of structural and manufacturing material. It is a coniferous wood, grows with a lofty, smooth body, of moderate diameter. It abounds in Maine, New Hampshire, Vermont, northern New York in large commercial quantity, and stands in considerable amount in upper Michigan, northern Wisconsin, northern Minnesota, also in the Appalachian range in the South. Industrially and commercially considered, spruce has occupied an important position in the lumber trade of the East. Maine has been the most prolific source of supply. Though spruce holdings in that State have been much reduced within recent years the annual cut is still considerable. The Adirondack region of northern New York is next to Maine in magnitude of spruce production. Spruce furnishes a large part of framing dimension used in Boston, New York, and other coast cities, and the districts contiguous to those centres. Spruce also enters into other forms of building material and also factory product. It is highly esteemed for siding of clapboards throughout New England. Spruce is also the main dependence in the manufacture of paper pulp, and a great industry has been developed in getting out pulp wood. In the old pine states of the Northwest the rather limited growth of spruce is being utilized for lumber and pulp wood. Pacific coast spruce is elsewhere treated of in this article.

White cedar, another conifer, is prevalent in all the New England and Middle States, and those touching the Great Lakes. It is used for railroad ties, telegraph and telephone poles and fence posts. Shingles also are comprised in white cedar products. The annual output is large, but no statistics of it have ever been gathered.

Cypress is a tree growth of the damper alluvial bottoms of the South and the Ohio River Valley. It makes a sizable growth and turns out a large percentage of clear lumber. The wood is comparatively soft and easily worked, and as a shop lumber and one adapted to interior building purposes, as well as for siding, porch work

and shingles, is taking the place of white pine. The same can also be said in reference to tank making, and it is much devoted to car building. The strongest present factor in the cypress trade is the red cypress produced in Louisiana. The most copious supply comes from the mills of that State and enters into the lumber trade of the Middle West, the Southwest and the East. Cypress is also in vogue among consumers in all the Gulf coast cities. A large amount of cypress is produced in the Carolinas and Florida, Georgia, Alabama, Mississippi and Arkansas.

The hardwoods of the United States in the early history of the country were much less prized than the coniferous timbers, especially the pines. This was because in the settlement of the country the soft woods were more available than the hard for structural purposes. They were abundant, were easily cut and handled and were light enough to float in the streams and lakes, then the only means of transportation. The live oak of the south Atlantic coast and the white oak of the North were from an early date used for ship-building and any purpose where great strength and durability were requisites. Oak, cherry, maple and birch were also employed for the making of furniture. In the latter use, however, mahogany entered into the making of furniture for the rich throughout the earlier and middle portions of our history. When the railroad era came in, the great interior of the northern States was opened up, population expanded and numerically increased, and the utility of and demand for the hardwoods began to be developed. Western New York, Ohio, Indiana, Michigan, southern Illinois and the valleys of the southern rivers abounded with abundant growths of fine oak of several varieties, ash, black walnut, yellow poplar, hickory, sycamore, gum and other useful woods. New England, New York, Michigan, northern Wisconsin and northern Minnesota were included in the zone where maple, beech, elm, birch, black and white ash and other available woods abounded.

Commercially considered, the great leader among American hardwoods is oak in its several varieties; paramount among the varieties is white oak. In trade and the industries white oak ranks relatively with white pine, and for cabinet purposes is a near approach to mahogany. No other wood enters into so wide a range of uses as white oak. It is employed as timber and planking in ships, in the construction of canal locks, bridges, railroads, cars, vehicles of all kinds, agricultural machinery, tools, cooperage etc., outside of interior finish and furniture manufacture. In respect to the last two named uses white oak has taken first place in the common application, though red oak is largely employed. In the very finest finish and furniture mahogany only ranks above white oak. The growth of the hardwood lumber trade was accelerated after railroads began to penetrate the western States, beginning with about 1845, the mileage extending rapidly after 1850. For many years thereafter the oak and ash supply was largely drawn from the States north of the Ohio River, but considerably from Kentucky and Tennessee. Along in 1880 hardwood lumbermen began to invade the rich hardwood regions of the lower Mississippi and tributaries, lying along the river bottoms in Missouri, Arkansas, Mississippi and Louisiana. The hardwood industry of these States has in latter time grown to immense pro-

LUMBER INDUSTRY IN THE UNITED STATES

portions, though the output of oak in either Indiana or Ohio up to 1900 continued to exceed that of any of the Southern States.

The total production of oak in 1900 was 4,438,027,000 feet, the total valuation having been \$61,174,120 on a basis of \$13.78 a thousand. During the past 25 years there has been a remarkable increase in the use of both white and red oak in finishing the interior of buildings and the making of furniture. In the earlier history of the country, pine was mostly employed in the interior work of all but first rate structures throughout the country from the eastern seaboard westward. But in the recent period of rapid accumulation of wealth and the growth of artistic and luxurious tastes, soft woods for interiors have largely been discarded, and oak has been substituted as the most available for medium class structures, and to a large extent the better class when mahogany and other tropical woods were not utilized. This copious use of oak has promoted a great industry and a trade which is not only domestic in prevalence but extends to Europe and other foreign countries. Quarter sawing is a special feature in the treatment of both white and red oak, that kind of manufacture being especially chosen for the finer finish and furniture. Red oak has long been the favorite in both plain and quarter-sawed treatment among home finishers and furniture manufacturers, because of its softness and easiness of working and its bright and conspicuous figure when plain sawed lumber is finished. Next to oak, ash leads in the manufacture of agricultural machines and implements, boat oars and various other manufactures. White ash is the strongest variety, but black ash is largely used in cooperage, bent work, some cabinet work and house finish. The available quantity of ash of both varieties is rapidly diminishing.

As late as 1880 to 1884 black walnut was the most conspicuous furniture wood in the United States, and also much employed for interior finish. It not only was a favorite in this country but in Europe as well. Its most abundant supply was in the States of the Ohio River watershed, Indiana probably leading in the total production. It is a regal wood, though it has passed to the rear in demand, partly because of its diminishing supply and partly because the public taste at length revolted at its sombre hue. Yet walnut stands preeminent as a cabinet wood in some particulars. There are its softness under the operation of tools, its satiny appearance when finished, its durability under hard treatment, and its dignity as compared to other woods either in furniture or finish. Though the supply of black walnut has so far diminished as to place it among the minor kinds of American lumber, it is still present in considerable quantity. Indiana, Ohio, Missouri, Tennessee, Iowa and Kentucky still furnish the market with walnut, the total from the last census having been 38,636,000 feet. Of this total Indiana is credited with 10,637,000 feet, Ohio coming next with 6,857,000 feet and Missouri third with 6,285,000 feet. The larger portion of the black walnut now produced is shipped to foreign countries, Germany and France probably being the larger purchasers.

Maple, elm of the soft and hard varieties, birch, cherry, chestnut, sycamore and beech are all used for furniture making, for house trim, and various other things. At one time cherry

was an important furniture wood, but the supply is so nearly exhausted that it commands less attention than formerly. Chestnut is much devoted to coffin making, and sycamore is employed when a rarity in figure is wanted in interior finish or furniture. Both are minor woods in the trade. Hickory has always been a favorite in the construction of vehicles, on account of its toughness and elasticity. The available quantity is never in excess of demand.

Basswood is classed among the hardwoods commercially speaking, because it is a deciduous growth. Its texture is, however, softer than that of some of the coniferous woods. Basswood abounds in the northern forests, and to a degree in the South, but its most natural habitat is in the maple and beech zone. It has entered largely into the lumber industry, being especially prized by the furniture makers, used to some extent in exterior and interior building, and is highly prized in all work where a white, easily worked and sometimes elastic wood is required. The forest growth is being rapidly exhausted in Michigan and Wisconsin, which States have harbored the most abundant tracts within recent years.

Among the hardwoods gum, or satin walnut, as it is called in Europe, has recently risen in importance. It abounds in the Ohio and lower Mississippi valleys and wherever river bottoms are found all over the South. It is a hard, compact wood of involved grain, but is of large growth, comparatively free of knots, and is being made adaptable to various uses. The two main varieties are red gum and tupelo. The red variety, so called from the color of the heart wood, is preferred by the mill operators and consumers. A few years ago gum was a rejected kind of lumber, because the saw-mill operators and handlers were ignorant or regardless of the best methods of treating it so as to prevent its tendency to warp. But the demand within recent years has so increased that manufacturers have been urged to the discovery and practice of improved methods, with the result that gum is now successfully treated and has become an important factor in demand. Since there is a vast growth of gum on southern river bottoms a great enlargement of product is inevitable.

Cottonwood in recent years has come to the front as a kind of lumber adapted to box manufacture, wagon box boards, backing for furniture and other purposes where cheap and workable lumber is requisite. The supply is mainly confined to the bottom lands of the lower Mississippi, and at the rate it is being cut out will not last many years.

As an all-purpose wood poplar is perhaps as adaptable as any that is converted into lumber. Reference is here made to the poplar of Kentucky, Tennessee, West Virginia, Indiana, Ohio and southern Michigan. The wood is called the tulip, and in northern Indiana and southern Michigan whitewood. It should not be confounded with the aspen poplar of the North and Canada. Poplar or tulip, the commercial wood here treated, attains a large growth. Poplar lumber is devoted to a great variety of uses. Owing to the size of the logs the average of the lumber is wide, and therefore is adapted to work that demands such lumber. It is of tough fibre, though easily worked, and adapted to re-

LUMBER STATE—LUMPSUCKER

sawing and bent work. It is much used for carriage bodies, coffins, wagon boxes, furniture, stained finish, packing boxes, porch columns, agricultural machines, billiard tables, siding and casings for houses, door and sash making, and a multitude of applications that cannot be mentioned here. In fact there is little wood work to which poplar cannot be made to apply. For this reason the domestic and foreign demand for poplar has always readily absorbed the supply, but it is constantly brought into sharp competition with other woods. See FORESTRY IN THE UNITED STATES; WOOD-WORKING MACHINERY.

J. E. DEFEBAUGH,

Editor of the 'American Lumberman.'

Lumber State, a popular designation for the State of Maine; because of the large forests and the great number of its people engaged in lumbering.

Luminais, Evariste Vital, év-ä-rêst vê-täl lü-mê-nâ, French painter: b. Nantes 14 Dec. 1822. He studied with Léon Cogniet and Troyon, received a third-class medal at the Paris exposition of 1855, and one of the first class at that of 1889. His works are largely genre and historical studies from Gallic legends and early French annals, and his manner is spacious and full of vigor.

Luminiferous Ether. See ETHER.

Luminous Paint, a paint containing phosphorus, which after exposure to strong light becomes luminous in the dark for a time. It is used for street signs, buoys, clock dials, etc. See also PAINT; PHOSPHORESCENCE.

Lum'nis, Charles Fletcher, American author: b. Lynn, Mass., 1 March 1859. He was graduated from Harvard in 1881, went to Los Angeles, Cal., there was an editor of the *Daily Times* (1885-7), and later became editor of the monthly 'Out West.' He spent five years among the Pueblo Indians of New Mexico, studying their speech and customs. Among his writings are: 'A Tramp across the Continent' (1892); 'The Land of Poco Tiempo' (1893); 'The King of the Broncos' (1897); 'The Enchanted Burro' (1897); 'The Awakening of a Nation' (1898), and the collection, 'The Man who Married the Moon, and other Pueblo Indian Folk-Stories' (1894).

Lump'kin, John Henry, American jurist: b. Oglethorpe County, Ga., 13 June 1812; d. Rome, Ga., 6 June 1860. He studied at Franklin College of the University of Georgia and at Yale; after a course in law was admitted to the bar in March 1834, entered practice at Rome, Floyd County, Ga., was a member of the Georgia house of representatives in 1835, and was solicitor-general of the Cherokee circuit in 1839-42. As a Democrat he sat in the United States Congress in 1843-9 and 1855-7; and in 1849-52 he was judge of the Cherokee circuit court. In 1857 he was Democratic candidate for governor of Georgia, but was defeated. In 1860 he was a delegate to the State Democratic convention (June) and to the Democratic national convention held at Charleston, S. C., and Richmond, Va. (23 April; 21 June).

Lumpkin, Joseph Henry, American jurist: b. Oglethorpe County Ga., 23 Dec. 1799; d. Athens, Ga., 4 June 1867. He was a brother of Wilson Lumpkin (q.v.). He was graduated

from the College of New Jersey (now Princeton) in 1819, studied law in the office of Judge Cobb at Athens, was admitted to practice in October 1820, and practised at Lexington, Ga., until 1844. In 1824 and 1825 he represented Oglethorpe County in the State legislature of Georgia, and from 1845 was chief justice of the Georgia supreme court. He was one of the chief organizers of the Lumpkin law school of the University of Georgia, and occupied the chair of law in the school in 1859-61. He resumed the professorship in 1865, and retained it until his death. In 1833 he assisted in the compilation of the penal code of Georgia. Both as an advocate in criminal cases and as a judge he is described as exceedingly able. For many years he was prominent in the temperance movement.

Lumpkin, Samuel, American jurist: b. near Lexington, Oglethorpe County, Ga., 12 Dec. 1848; d. Washington, Wilkes County, Ga., 18 July 1903. He was graduated from the University of Georgia in 1866, was admitted to the bar in 1868, was solicitor-general of the northern Georgia circuit in 1872-6, and State senator in 1878-80. In 1885-90 he was judge of the superior court of the northern circuit, on 1 Jan. 1891 became associate justice of the supreme court of Georgia, and on 4 Jan. 1897 presiding justice of the 2d division of that court.

Lumpkin, Wilson, American politician: b. Pittsylvania County, Va., 14 Jan. 1783; d. Athens, Ga., 28 Dec. 1870. He was a brother of Joseph Henry Lumpkin (q.v.). He removed to Oglethorpe County, Ga., in 1784; in 1797 was made a copyist in the superior court of Oglethorpe County; was admitted to the bar; and practised at Athens, Ga. He was elected several times to the lower house of the Georgia legislature, and also served in the State senate. In Congress he sat as a representative from Georgia in 1815-7 and 1827-31. In 1831-5 he was governor of Georgia (two terms). During his administration the Cherokees were deported across the Chattahoochee, and the region previously occupied by them was subdivided into thirteen counties, the county and town (in Stewart County) of Lumpkin being named in his honor. From 13 Dec. 1837 to 3 March 1841 he was United States senator to fill a vacancy. In 1823 he was appointed by President Monroe to determine and map the boundary line between Georgia and Florida; and he was also a member of the first State board of public works, appointed by the legislature. As State surveyor he laid out most of the lines of early Georgia railways.

Lumpkin, Tony, in Goldsmith's comedy 'She Stoops to Conquer,' a rude country squire, the son of Mrs. Hardcastle by her first marriage. He is ignorant and boisterous, and clownishly conceited, and the humor of his practical joking bears the stamp of his innate viciousness.

Lump'sucker, an extraordinary marine fish (*Cyclopterus lumpus*), of oval, ugly form and allied to the sea-snails (*Liparis*) and gobies. It is remarkable for the brilliant red and purple colors which the male puts on in the breeding season in the spring, when it approaches rocky shores on both sides of the northern Atlantic to deposit its spawn. This fish has the short ventral fins so united as to form a sucking disk by which it attaches itself to the bottom and holds on against waves and currents, while it preys upon small fishes, crustaceans, etc. It

LUMPY JAW—LUNDY

is well known and eaten in Scotland under the name "cockpaille."

Lumpy Jaw. See ACTINOMYCOSIS.

Luna, Antonio, ăn-tō'nē-ō loo'nā, Filipino insurgent politician: b. Manila, Philippine Islands, about 1854; d. Luzon Island, Philippines, 8 June 1899. He was educated largely in Paris, returned from Europe to Manila early in 1898, and became the editor of 'La Independencia,' organ of the insurgent party. Upon the formation of a so-called government by Emilio Aguinaldo in December 1898, the latter placed Luna at the head of the war department. Shortly afterward Luna was removed from this post and made the immediate commander of Aguinaldo's forces with general's rank. Difficulties arose between himself and Aguinaldo; and the latter, fearing, it was said, an attack upon his life by Luna, ordered the guards to kill anyone regardless of rank who might attempt to enter the headquarters. Upon Luna's appearance and demand for an interview, he was accordingly shot.

Luna, Pedro de, pā'drō dā, antipope: b. Spain 1334; d. Peñíscola, Valencia, 1424. He was sprung from a noble family of Aragon, and, after entering the priesthood, became distinguished as a canonist, and was appointed professor in the university of Montpellier. He received a cardinal's hat in 1375 and was elected to Avignon as antipope in 1394. The conclave of cardinals annexed as a condition to his election, that he should resign if ever an opportunity occurred when, by so doing, he could put a stop to the schism. This he refused to do although he was deposed by the council of Pisa (1409), and by that of Constance (1417). Banished from Avignon, he retired to the fortress of Peñíscola, near Valencia; where he spent the rest of his life in excommunication.

Luna, lū'nā (the moon), among the Greeks *Selēnē*. Her worship is said to have been introduced among the Romans in the time of Romulus. She had a temple on the Aventine, one on the Capitol, a third on the Palatine.

Luna Moth, one of the largest and most beautiful of the great American silkworm moths, *Tropæa luna*. Its general color is delicate green, there is a purple brown band along the front edge of the fore wings, and a pair of richly colored ocelli upon each of both pairs of wings, the hinder pair of which terminate in long curving "tails." The caterpillar grows to a length of about three inches, and is pale bluish green with a pearl-colored head; it has a pale yellow stripe along each side of the body, and a transverse yellow line on the back between each two abdominal segments. It feeds upon leaves of forest trees, as the hickory, walnut, etc. The cocoon is formed of a very thin, leaf-like material with little silk, and is usually found upon the ground.

Lū'nacy, Lunatic, etc. See INSANITY.

Lunalilo, loo-nā-lē'lō, **William C.,** king of the Hawaiian Islands (1873-4): b. 1835; d. 3 Feb. 1874. He received a good education, and was liberal in his political views. His health failed soon after his ascending the throne, and he paid inadequate attention to administrative business.

Lū'nar Caustic. See NITRATE OF SILVER.

Lunar Tables, in astronomy, ponderous volumes of solid figures which are the numerical development and tabulation of the analytical theory of the moon's motions and perturbations. See MOON.

Lunar Theory, The, in astronomy, the deduction of the moon's motion from the law of gravitation. See MOON.

Lunar Year. See YEAR.

Lund, loond, Peter William, Danish naturalist: b. Copenhagen, Denmark, 14 June 1801; d. Lagôa Santa, Minas Geraes, Brazil, 5 May 1880. He traveled in Brazil 1827-30 and was sent there on a Russian scientific expedition in 1831. Three years later he established himself at Lagôa Santa, where he passed the rest of his life in exploring the limestone caves of the region and studying the fossils contained in them, discovering several hundred species in the course of his investigations.

Lund, Sweden, town, in the län of Malmöhus, on an extensive plain, about eight miles from the Sound and 24 miles east of Copenhagen. It is a very ancient place, and was once surrounded with wooden fortifications, and had its warehouses filled with the merchandise and treasures. In the Middle Ages the Scandinavian monarchs were elected kings of Scania on a hill in the immediate vicinity. The present town occupies a large extent of space, and is very irregularly built. It has an ancient Romanesque cathedral, one of the finest churches in Sweden (recently restored); a university attended by 700 students, and occupying buildings erected in 1878-82, while the old building contains the library (180,000 volumes), historical museum, etc. With the university are connected a zoological museum and a botanic garden. The town boasts of a statue of Tegnér, and the house in which he lived. Glovemaking and iron-founding are among the industries, and there is a trade in agricultural produce. Pop. (1901) 16,621.

Lun'dy, Benjamin, American abolitionist: b. Hardwick, Sussex County, N. J., 4 Jan. 1789; d. Lowell, La Salle County, Ill., 22 Aug. 1839. His parents were members of the Society of Friends. At 19 he removed to Wheeling, Va., where he labored as an apprentice to a saddler. At this place his attention was first directed to the subject of slavery. He subsequently settled in business in St. Clairsville, Va., where in 1815 he originated an anti-slavery association, called the "Union Humane Society." Soon after a journal entitled "The Philanthropist" was commenced at Mount Pleasant, Ohio, to which Lundy contributed. He then visited St. Louis, where he remained nearly two years engaged in a newspaper exposition of the slavery question. At Mount Pleasant, he commenced, in 1821, the publication of the 'Genius of Universal Emancipation,' the office of which was removed to Baltimore in 1824. In 1825 he visited Hayti to make arrangements for the settlement of emancipated slaves. In 1828 he visited the eastern States, where he formed the acquaintance of a number of prominent abolitionists, one of whom, William Lloyd Garrison, afterward became associated with him in editing his journal. In 1830-1 he traveled in Canada and Texas to obtain subscribers to his paper, and to continue his observations on the condition of the slaves. He continued his literary connection with the

LUNG-FISHES.

3

1. Australian Lung-fish, or Barramunda. 2. Amazonian Mud-fish, or Lepidosiren.
3. African Mud-fish, or Protopterus.

'Genius of Universal Emancipation' as long as it was published, and was the first to establish anti-slavery periodicals and the delivery of anti-slavery lectures, and probably the first to introduce the formation of societies for the encouragement of the produce of free labor. Consult Earle, 'The Life, Travels, and Opinions of Benjamin Lundy' (1847).

Lundy's Lane, Battle of, also called the Battle of Niagara, or Battle of Bridgewater. This was a severe engagement fought on Canadian soil near Niagara Falls, 23 July 1814, between the British and American forces. Two days after the defeat of the British under Gen. Riall at Chippewa by Brig.-Gen. Scott 5 July 1814, the American forces under Gen. Brown, numbering about 3,000 men, crossed the Chippewa River and took post at Queenstown; Riall, after throwing a portion of his force into Fort George, retreating to a strong position near the head of Lake Ontario. Occasional skirmishes took place between the outposts of both armies; but Brown, finding that he had no battering cannon to besiege Fort George, and being unwilling to leave that fortress in his rear, fell back after a few days to the Chippewa. Here on the 25th he received intelligence that Gen. Drummond, who had reached Fort George with British reinforcements, had crossed the Niagara River at Queenstown to attack Fort Schlosser, where the American supplies were deposited. Scott was at once detached with 1,200 men to make a demonstration at Queenstown, and about sunset unexpectedly came up with Riall and his whole force at the head of Lundy's Lane. The small American force received the full fire of the British infantry, and held their ground until the arrival of the main body of the American army. Fighting continued during the night. Scarcely an officer remained unwounded in the American ranks, and the men, faint with their exertions and tormented by thirst, were ready to sink with exhaustion. Unwilling, however, to relinquish the field, they replenished their ammunition from the cartridge boxes of their fallen comrades and foes, who covered the ground around the battery, and then calmly awaited the assault of the British. After an hour's pause the latter, reinforced by fresh troops from Fort George, advanced under Gen. Drummond to the last assault. The conflict which ensued was more deadly than ever. At length the enemy, broken, and foiled at all points, retired. Brown and Scott being now disabled by wounds, the command devolved upon Colonel Ripley, who, finding the enemy indisposed to renew the attack, drew off his troops to the camp. In this battle, the most obstinately contested perhaps ever fought upon the American continent, the British force, beside greatly outnumbering their opponents, had the advantages of position and preparation. Against these odds the troops of Brown fought with a valor and obstinacy unparalleled in the war, and which did much to disabuse the country of the idea, then prevalent, that American troops could not cope with the trained veterans of Europe. According to the official accounts, the Americans lost in killed and wounded 743 men, and the British 878. Ripley, finding his forces reduced to less than 2,000 effective men, retired to the neighborhood of Fort Erie, having first destroyed the bridge over the Chippewa and a portion of his stores.

Lunenburg, loo'n'en-bérg, Canada, town, seaport, capital of Lunenburg County, in the province of Nova Scotia; and about 35 miles southwest of Halifax. The first settlement was made by Germans, in 1753. It has a large, safe harbor. The chief industries are ship-building and fishing. Lunenburg has a large fishing-fleet engaged in the cod and other fisheries, and it exports considerable fish and lumber to the West Indies. Pop. (1891) 4,898; (1901) 2,916.

Lungfish, a fish of the group *Dipnoi* (q.v.), few existing species of which remain. These are mostly sluggish fishes of tropical fresh waters, whose respiratory organs are lung-like. See BARRAMUNDA; CERATODUS; LEPTOSIREN; and ICHTHYOLOGY.

Lun'gren, Fernand Harvey, American painter and illustrator: b. Maryland 13 Nov. 1859. He was educated at Maryland University, but before he could graduate he launched into the career of an artist with marvellous success, and became a favorite illustrator for some of the leading New York monthlies. He has paid great attention to night effects in city streets, but since 1891 has made an exhaustive study of the life, religion and folklore of the Indians of the Southwest, having had special opportunities as priest of the Snake-Antelope fraternity. His most notable pictures are: 'Thirst'; 'The Snake Dance'; 'Night in the Desert'; and 'A Ford on the Rio Grande.'

Lungs, the principal organs of respiration in air-breathing vertebrates. They are enclosed in the chest, an air-tight chamber which, mainly by means of the diaphragm (q.v.), acts as a bellows and moves in and out of them. There are two lungs, one on the left, the other on the right side of the chest, and between them are situated the heart and the great blood-vessels springing from it, the oesophagus, the thoracic duct, etc. The left lung is the smaller of the two, and both consist of a mass of ramified tubes, branches of the trachea, which unite them. Through the walls of the lungs all the blood of the body passes, receiving oxygen and throwing off carbonic acid. The simplest lung imaginable would be an elastic membranous bag, well supplied with blood-vessels, and with a pipe connecting it with the air; the most complicated lungs that exist are essentially of that construction, the purpose of the complications being merely the enlarging of the surface exposed to the air.

In all air-breathing vertebrates, the atmospheric air reaches the larynx through the nasal and the buccal cavities, then passes into the trachea, and into its ramifications which are called bronchi or bronchial tubes, and from these tubes into membranous pouches named alveoli. The terminal twig of a bronchial tube is a small canal, in which are found many openings or orifices of very short tubes, which are the ultimate ramifications of the tube. The lung-substance is composed of the alveoli, the air-sacs, the small bronchi, blood and lymphatic vessels, and nerves; the whole enclosed in a membrane that surrounds each of the lungs and is known as the pleura. The trachea or windpipe extends from the lower part of the larynx, of which it is the continuation, to the middle of the thorax, where it divides into the two large bronchi. It is situated in the middle

LUNGS

line of the body, in front of the last cervical and the first five or six dorsal vertebrae. In the back part of the trachea there are transversal muscular fibres of the unstriped variety. The fibrous tissue found in the trachea belongs to the two varieties of yellow elastic and white fibres. The mucous membrane is thin and in perfect continuity with that of the larynx and that of the bronchi. Its most remarkable feature is that its epithelial covering is composed of ciliated cells having in high degree the vibratile movement. All along the trachea there are many mucous glands, and these are especially numerous upon its back part. The cilia lash upward, and thus keep the passages free from mucus and remove foreign particles. As the passages become smaller they lose their cartilages, and the muscles form a continuous circular layer. The length of the trachea is from four to five inches. The average transversal diameter of this tube is between nine and twelve lines in adults. The anterior two thirds of the trachea is cylindrical, the posterior third is a flattened wall. In the neck the trachea is covered by the skin and a few flat muscles; in the chest it is placed between the two lungs and covered by muscles, lymphatic glands, and the bony and cutaneous walls of the thorax. The structure of the trachea is complicated. This tube is essentially composed of an internal layer which is a mucous membrane and an external one which is fibrous. Imbedded in these membranes are from 16 to 20 cartilaginous pieces, with the shape of a horseshoe, or of a ring one third of which is missing. These incomplete rings are placed transversely at nearly equal distances one from the other; they give to the anterior two thirds of the trachea the cylindrical form.

The essential parts of the lungs are the air-cells or air-sacs, in which the function of respiration is performed. They consist of somewhat elongated cavities, which communicate with a bronchial ramification by a circular opening, usually smaller than the cavity of the cell. The air-cells are arranged in groups and separated from each other by thin walls. Many small,

shallow, cup-like depressions, separated from each other by portions of membrane, are found at the bottom and on the lateral walls of the air-sacs. These, the alveoli, have no communication with each other except by their opening in the cavity of the air-sac. An epithelial layer exists in the air-cells and the alveoli. The walls of the air-cells are formed of a thin membrane in which the blood and lymph-capillaries ramify. Minute openings lead from the air-cells into the lymph-spaces of the membrane. The membranous walls are partly formed of elastic tissue. It is this that gives to the lungs their elasticity. At the root of the lungs the membrane known as the visceral pleura is continuous with a membrane which lines the chest-cavity (the parietal pleura). The space between the two is the pleural cavity; it is in reality a large lymph-space, and communicates with the lymphatics of the pleura. Owing to the air-pressure within the lungs, the two pleurae are closely pressed together, the lungs entirely filling the chest-cavity.

The lungs are united with the heart and with the trachea by a part called the root, which, in each side, is composed of the large bronchus, a branch of the pulmonary artery, two pulmonary veins, and smaller vessels and nerves, the whole being almost completely covered by the pleura. Each lung is divided into lobes, two in number in the left one and three in the other. Each lobe is divided into lobules, which are arranged on the bronchial tubes like grapes on a bunch. Each lobule is surrounded by condensed areolar tissue mixed up with yellow elastic tissue. Each lobule is a fair representation, on a small scale, of a whole lung, as it hangs upon a bronchial tube, a branch of the pulmonary artery, branches of bronchial vessels, and nerves. In the roots of the lungs the two large bronchi divide, the right into three, and the left into two bronchial tubes, one for each of the pulmonary lobes. The primary bronchial tubes are very short, and divide into two or three smaller tubes, each of which gives off two or three divisions. Before reaching their termination, the tubes branch off four or five times more.

The weight of the lungs varies much according to age and sex. In adult men the two lungs weigh from 40 to 50 ounces, and in women from 28 to 35 ounces. The ratio of the weight of the lungs to that of the body is as 1 to 30 or 40. The specific gravity of the lungs is very slight, and, unless the air has been expelled from the cavities of the bronchial tubes and of the alveoli, any part of the lungs dipped into water will rise and float.

As respiratory organs the lungs bear a certain average relation to the physical proportions and condition of the individual. The average amount of air in the case of an individual 5 feet 8 inches in height that goes in and out of the lungs at each inspiration and expiration is about 20 cubic inches; this is called the tidal air. By means of forced inspiratory movements the ingoing tide may be increased by 120 cubic inches; by means of a forced expiration the outgoing tidal air may be increased by 90 cubic inches. After the most forced expiration possible there always remain within the lungs about 90 cubic inches of air. So that if a person takes as deep a breath as possible, and then makes as forced an expiration as he can, he will

LUNGS

drive out $120 + 20 + 90 = 230$ cubic inches of air. This is termed the respiratory capacity. Since the tidal air is only 20 cubic inches, and 180 cubic inches remain in the chest after an ordinary expiration, it follows the air directly changed during respiration is not that really within the lungs themselves, but is that within the nose, windpipe, and larger bronchi, the pipes that result from the branching of the windpipe. Therefore the changes of the air within the essential parts of the lungs are the result of diffusion between it and the purer air of the bronchi, aided by the rush with which the tidal air flows in.

The ordinary respiratory movements differ in the two sexes and at different periods of life. In young children the chest is altered in size chiefly by the movements of the diaphragm, and the protrusion of the abdominal wall during inspiration is therefore very marked. In men also it is the diaphragm which is chiefly operative, but the ribs are also moved. In women it is the movement of the ribs, especially the upper ones, which is the most extensive. The respiratory rhythm is the relation of the acts of inspiration and expiration to each other as regards time. See ANATOMY; BREATHING AND HEALTH; CIRCULATION; LUNGS, DISEASES OF; RESPIRATION.

Lungs, Diseases of. The disorders to which the lungs of man are subject form a long list of maladies, involving numerous complications. Of these the more important will be considered here.

Congestion of the Lungs.—Pulmonary congestion (hyperæmia) may be active or passive. In the majority of cases active congestion is a symptom or a condition associated with bronchitis, pleurisy, pneumonia, or tuberculosis. In rather rare instances it may result from violent exertion, or from drunkenness and exposure to great cold or heat, followed by œdema, possibly by death. As symptoms this primary congestion presents cough, rapid breathing, frothy, blood-tinged expectoration, harsh respiration with fine moist râles, and absence of fever unless there is co-existing inflammation. Passive hyperæmia may be mechanical or hypostatic. Mechanical congestion is due to the presence of some obstruction to the return of the blood to the left side of the heart, such as emphysema or affections of the left ventricle, especially mitral narrowing or incompetency. Rarely it arises from pressure by tumors. The symptoms are cough, shortness of breath, blood-stained, frothy expectoration, and possibly spitting of blood (hæmoptysis). Hypostatic congestion (settling of blood to the lowest parts of the lungs) occurs in conditions of great debility attended by feebleness of the heart, and is favored by prolonged lying upon the back. It is therefore most common in long-continued typhoid fever, paralysis, prolonged unconsciousness, abdominal dropsy or tumors, and wasting diseases, especially tuberculosis and cancer. The physical signs are slight dulness over the bases of the lungs posteriorly, with weak or harsh and perhaps broncho-vesicular respiration, and moist râles.

Edema of the Lungs.—This condition—an effusion of watery fluid (serum) from the capillaries into the air-cells and their walls—is almost invariably a sequel of congestion or in-

flammation of the lungs. It may be local, surrounding a circumscribed and usually inflammatory lesion; or general, due to causes in all respects similar to those which produce congestion. Pulmonary œdema occurs most commonly in connection with pneumonia, cancer, grave anæmias, Bright's disease, acute specific fevers with weak heart, valvular disease of the heart, and apoplexy. The œdema may occur suddenly, especially in Bright's disease. Usually its onset is gradual. The symptoms are increasing shortness of breath (dyspnœa), blueness (cyanosis) of fingers, lips, and skin, cough, and abundant watery, frothy, perhaps blood-stained, expectoration, without fever except from a causative inflammatory or febrile disease. The physical signs are slight dulness over the bases, and weak, perhaps broncho-vesicular, breath-sounds, with many unusually liquid large and small râles.

Embolism of the Lungs.—Foreign bodies (emboli) carried by the blood and lodging in the smaller arteries or capillaries of the lungs usually consist of disintegrated blood-clots (thrombi); less commonly of vegetations from diseased heart-valves, or masses of pathogenic germs. As a result of the cutting off of the blood-supply circumscribed dark-red wedge-shaped areas of necrosis (hemorrhagic infarctions) occur. Emboli may be non-septic (not containing disease-germs), originating most commonly from chronic disease of the heart; or septic, arising from a gangrenous or suppurating focus in some part of the body. A non-septic infarct may in time be replaced by scar-tissue; if septic, abscess or gangrene of the lung may result. If the embolus is so large as to obstruct a main branch of the pulmonary artery, sudden death may take place. In occlusion of medium-sized branches there will be cough, spitting of blood, intense breathlessness, fainting, perhaps coma and convulsions. When the smallest branches are involved there may be slight cough, hæmoptysis, and dyspnœa. The spitting of dark frothy blood during the course of chronic cardiac disease is particularly suggestive. If the infarction is very large the physical signs of a limited consolidation are present, followed, if the embolus is septic, by the evidences of pulmonary abscess or gangrene.

Pneumonia.—Two main varieties are recognized, lobar pneumonia and broncho-pneumonia.

Lobar Pneumonia.—This disease (called variously croupous pneumonia, pneumonitis, lung fever, inflammation of the lungs) is caused directly in the large majority of cases by the *Diplococcus pneumoniae* (or *lanceolatus*) of Fraenkel. Exposure to cold and wet, alcoholism, and debility from pre-existing disease predispose. One attack renders a second more likely. Three stages are recognized in the pathological anatomy, congestion, red hepatization, and gray hepatization. In the first stage the lung is deep-red, rather firm, does not collapse, and the cut surface exudes a frothy, blood-stained, watery fluid. In the second stage the affected portion is dark-red, firm, and sinks in water. It tears easily, the torn surface is granular and dry, and the air-cells (alveoli) are filled with coagulated fibrin containing many red and some white blood-cells. In the third stage the color becomes a mottled gray, and the cut surfaces are moist. The exudate in

LUNGS

the alveoli undergoes softening and liquefaction, and is either expectorated or carried away by the lymphatics.

The symptoms of a typical case begin abruptly with a severe chill, and a sharp stabbing pain in the side, followed by a quick rise of temperature to 104° or 105° F. The breathing is rapid, varying from 40 to 60 or over, with an expiratory grunt, and a dry, restrained, and painful cough. The face is flushed, there is often a circumscribed redness on the cheek of the affected side, and the nostrils dilate with each inspiration. A thick, tenacious, rusty, or blood-stained expectoration appears. The pulse is rapid (100 to 120) and bounding. The tongue is coated, the bowels constipated, the urine scanty, high-colored, often slightly albuminous, and as a rule strikingly deficient in chlorides. The lips are often bluish and present herpetic eruptions (cold-sores). Delirium is frequently manifest. In the majority of cases there is an increased number of white cells in the blood (leucocytosis), the count ranging from 12,000 to 50,000. The fever, having risen to its highest point (as a rule within 24 hours), remains high, with remissions, for from 5 to 10 days, when typically it falls (by crisis) within a few hours (5 to 12) to or below the normal.

With reference to the physical signs: Compensatory increase of the movement of the unaffected side may be observed, and the vocal fremitus over the affected portion of the lung is increased, unless the bronchial tubes are filled with a thick secretion. There is marked dullness over the solidified lung areas. The percussion-note over the healthy parts of the lung, especially over those portions lying above an area of consolidation, may be hyper-resonant, or even tympanitic. In the early stages the breath-sounds may be weak, and the crepitant râle is often audible at the end of inspiration. As consolidation occurs, the breath-sounds become broncho-vesicular and finally intensely bronchial. The spoken and whispered voice-sounds are conveyed with great distinctness. During the second stage no râles may be heard, but friction sounds are often present. In the third stage (resolution) small moist crepitations (*râle redux*) become audible.

Death may take place at any time during the disease. It is a very fatal malady in drunkards, and in persons of 60 years or over (60 to 80 per cent); so also in infants under one year. As a rule, above one year, the younger the patient the better the outlook for recovery. The most common cause of a fatal result is the toxæmia (blood-poisoning) due to the causative germ, and the heart-weakness arising therefrom. Meningitis as a complication is always lethal. Unfavorable symptoms are the super-vention of the "typhoid status," very high fever (105° F. or over), marked cyanosis, severe dyspnoea, rapid extension of the disease to other lobes or to the opposite lung, and increasing weakness of the heart with pulmonary oedema.

In some instances of recovery the consolidation may persist for from eight to ten weeks (delayed resolution), during which there is fever of a remittent type. In rare cases lobar pneumonia may terminate in abscess, gangrene, or chronic fibrosis. Recurrences are frequent; third or fourth attacks are common, and eight to ten have been reported. Relapses are rare.

Like other infections due to specific micro-organisms, lobar pneumonia may present striking variations both in symptoms and character. Thus the fever may be slight or entirely absent in old persons and chronic alcoholics. The crisis may be as early as the third day. The fever may terminate by lysis (gradual fall) instead of by crisis (sudden fall), especially in children. There may be a false (pseudo) crisis two or three days previous to the final fall. Not infrequently cough and expectoration are slight or absent in the very old, the very young, in topers, and in those previously ill with serious acute or chronic maladies. The sputum may be of a red, rusty, yellow, or dark-brown ("prune-juice") color. Very seldom there is spitting of blood early in the disease. Pain is absent in deep-seated pneumonias when the pleura is not involved. In children the pain is usually referred to the abdomen; and abdominal pain, often severe, and generally due to involvement of the diaphragmatic pleura, is not uncommon in adults. Tympanites (excessive amount of gas in intestines) is by no means rare. The pulse may be dicrotic in severe cases, or small and rapid, or full but soft and followed by serious weakness of the heart. The character of the pulse is no indication of the manner in which the right ventricle is standing the strain of pulmonary obstruction. A more reliable criterion is the pulmonary second sound, which, if accentuated, shows that the lesser circulation is being maintained. A persistent absence of leucocytosis is, except in mild cases, a symptom of bad omen. Convulsions often initiate the disease in children, and in them the symptoms may closely resemble those of meningitis. Deafness not depending upon inflammation of the middle ear is not infrequent. The delirium of lobar pneumonia may be active or maniacal, especially in drunkards.

The variations in the character of the disease depend partly upon the site and extent of the local lesions, but mainly upon differences in the resisting power of the patient and the virulence of the pneumococcus. Among the atypical cases are those occurring in old persons. In them the disease is often latent, there is no chill, and but slight cough or expectoration. The general prostration is marked, while the physical signs are indefinite or obscure. In infants and young children the disease frequently begins at the apex (top) of the lungs, the temperature is high, and convulsions, delirium, stupor, and coma are often prominent symptoms. Not infrequently vomiting and diarrhoea are so severe and persistent that the pneumonia may be overlooked. Typhoid pneumonia is characterized by muttering delirium, dry brown tongue, teeth covered with sordes, twitching of the tendons (*subsultus tendinum*), and perhaps picking at the bed-clothes or grasping at imagined objects in the air (*carphologia*)—symptoms resembling those which may appear in a severe attack of typhoid fever. In drunkards the disease may begin gradually, the fever may not be high, the delirium is commonly of the violent type, and the typhoid status often develops, ending in death by exhaustion. The localization of pneumonia is variable. Most frequently the right lower lobe is attacked, and in double pneumonia both lower lobes are usually involved. When the consolidation steadily advances from lobe to

LUNGS

lobe it is called wandering or migratory pneumonia. Cases presenting delayed physical signs are very perplexing unless rusty sputum is present. The evidences of consolidation may not appear until the fifth or even the eighth day of the disease, a fact doubtless to be explained by the consolidation beginning in the centre of the lung and extending slowly to the surface.

Among the complications of lobar pneumonia the most frequent is pleurisy, either serous or purulent (empyema). When the pleurisy is so severe and extensive that it rivals or surpasses the pneumonic element it constitutes pleuropneumonia. The ordinary dry pleurisy which covers the consolidated area, and which is responsible for the stabbing pain in pneumonia, cannot be considered a complication. When a pleurisy follows pneumonia an irregular, perhaps slight, rise of temperature persists, the physical signs of fluid in the pleura become manifest, and leucocytosis continues. Endocarditis, usually affecting the left side of the heart, is the next most frequent complication, and it may be of the ulcerative type. From 15 to 25 per cent of cases of the malignant form of the disease originate from pneumococcic infection. Symptoms are uncertain and sometimes absent. A prolonged irregular fever, with chills and sweating, is suspicious; if evidences of embolism occur, and meningitis is present, together with the development of a loud diastolic murmur not previously found, the diagnosis of ulcerative endocarditis is assured. Pericarditis, usually fibrinous or serous, rarely purulent, occurs particularly in the double or left-side pneumonia of childhood. It is often latent or overlooked. Increased dyspnoea, weak pulse, and præcordial pain may declare its presence. Meningitis, a very serious and fatal complication, is fortunately rare, and when occurring often co-exists with malignant endocarditis. Marked cervical retraction, intense headache, delirium, and coma indicate a basilar inflammation. Meningitis of the convexity is usually not recognized. Jaundice of toxæmic origin is very common in some epidemics of pneumonia. Otitis media is not infrequent in children, parotitis is of occasional occurrence, so also are colitis and venous thrombosis. Nephritis, peritonitis, peripheral neuritis, embolism of the femoral or other large artery, and cerebral embolism with aphasia and hemiplegia are rare complications. Pneumonia and malarial fever may either precede or occur during an attack of pneumonia. Redness, swelling, and pain in one or more joints may become manifest during or after the crisis of a pneumonia, and the inflammation proceed to suppuration. The pneumococcus is found in the diseased joints (pneumococcic arthritis).

The diagnosis of lobar pneumonia is as a rule readily made, most cases presenting distinctive and unmistakable symptoms. The disease may be overlooked in the very old or the very young, or in those already seriously ill. Hypostatic congestion can usually be distinguished from pneumonia by the absence of rusty sputum, or of fever, and is commonly bilateral. In pulmonary oedema, cardiac disease or nephritis usually co-exist, and although dyspnoea, cough, and expectoration are present, there is no fever, the breath sounds are weak, there are numerous fine and coarse liquid râles on both sides of the

chest, and marked dulness and bronchial respiration are absent. In oedema the sputum is fluid, frothy, and not rusty. Acute bronchitis in children may simulate pneumonia, but there is no chill, convulsion, dulness, or bronchial breathing, the fever is not so high as in pneumonia, and there are dry and moist râles over both sides of the chest. Broncho-pneumonia generally follows a bronchitis or an acute infection like measles. The fever is irregular, lasts for weeks, and does not terminate by crisis. The sputum is streaked with blood rather than rusty. The physical signs consist mainly of dry and moist râles over both chests. If evidences of consolidation are found they lie in a vertical strip on both sides of the spine, while, on the other hand, in lobar pneumonia they are quite as well and often better perceived on the sides of the chest. Pleurisy with effusion is very rarely mistaken for pneumonia, except in children. In pleurisy there is seldom a chill, the fever is not so high and declines by slow lysis, the cough is dry, and there is no rusty sputum. The affected side is distended, vocal fremitus is absent, the line of dulness may shift as the patient is moved, the voice-sounds are absent or diminished, or there is egophony (a quavering quality of sound), and the respiratory murmur is absent or decreased. Bronchial breathing, if heard, is distant. The apex-beat may be displaced. Finally puncture affords proof positive of the presence of fluid. Acute pneumonic phthisis may exactly resemble lobar pneumonia until the eighth or tenth day, when the fever continues with profuse sweats, and the signs of softening (gurgling râles, amphoric or cavernous breathing) gradually appear. The sputum becomes green, and tubercle bacilli and elastic fibres are discovered in it. It may be impossible to distinguish between pneumonia presenting the typhoid status and typhoid fever complicated by pneumonia unless the case is seen from the outset, or rose-spots appear and a positive Widal reaction is present.

The treatment of lobar pneumonia involves careful attention to the details of nursing. The room should be especially well ventilated in order that the air of the chamber should contain the maximum natural percentage of oxygen. Too much bed-clothing and the swathing of the trunk in cotton, both too often seen, tend to keep the fever higher than it would otherwise be, and add to the discomfort of the patient. Absolute rest in the recumbent position together with the use of the urinal and bed-pan is, with rare exceptions, to be insisted upon. The regular free giving of water is of great importance. The diet should be that usually given in fever, comprising milk, clear or diluted, flavored or not, perhaps peptonized, plain ice-cream, and junket; broths of beef, mutton, chicken, oysters, or clams; tea, coffee, or weak cocoa; grape or orange-juice, lemonade, ginger-ale, and fruit-ices; albumin-water, egg-lemonade; and if necessary one of the proprietary liquid foods. The medicinal treatment depends so much on the character of the individual case and the intensity of the special symptoms that it is not practicable to describe it here in detail. There is as yet no specific—a remedy which cures or tends to cure a particular disease—for lobar pneumonia, although in the future a reliable anti-pneumococcic serum may

LUNGS

be discovered. Sodium salicylate and carbonate of creosote, the latter especially, have given apparent good results. One or two initial doses of quinine, say seven or eight grains of the sulphate, are highly recommended. An initial dose of calomel does good service. Side-pain is to be relieved, preferably by mustard, poultices, or the ice-bag; if necessary by the smallest efficient doses of morphine or Dover's powder. The use of oxygen is desirable except in the milder cases. Delirium and restlessness may need the use of trional, veronal, bromides, chloral, camphor, hyoscine hydrobromate, or morphine. For very high fever frictions with cold water are desirable. The cold tub may or may not be advisable, but its use is as a rule not to be commended. For weakness of the heart—the main channel through which life runs away in this disease—strychnine, caffeine, ammonia, and wine or spirits are most useful. In addition may be required digitalis, nitroglycerine, sparteine, strophanthus, camphor, and musk.

Broncho-pneumonia.—This (called also capillary bronchitis, lobular pneumonia, catarrhal pneumonia) is an inflammation of the terminal bronchi and their communicating air-cells, due to the presence of two or more varieties of micro-organisms. Those most commonly found are the *Pneumococcus lanceolatus*, *Streptococcus pyogenes*, *Staphylococcus aureus et albus*, and the germs of diphtheria and influenza (la grippe). The disease may come suddenly during good health, or may be secondary to some pre-existent disease. It attacks especially the very young (under five), the very old, or the debilitated of any age. It is most common among those who live in unsanitary surroundings. The primary cases are usually due to cold and exposure. The secondary cases follow acute bronchitis, measles, whooping-cough, diphtheria, scarlet fever, erysipelas, and small-pox. It may succeed the inhalation of food or drink while the patient is unconscious; or operations on the mouth or nose; or any accident or disease which permits germ-containing particles to enter the bronchial tubes.

The pathology of the disease involves the presence of small areas of consolidation around the bronchioles, and small patches of collapsed lung (which can be inflated) due to occlusion of the bronchi. The terminal bronchioles and the air-cells are filled with an exudate composed of leucocytes and degenerating epithelium. The bronchial walls also contain numbers of leucocytes. In the majority of instances both lungs are involved.

The symptoms, if the disease is primary, begin abruptly, with a chill and a rapid rise of temperature, thus resembling lobar pneumonia. If there is a pre-existing bronchitis of the larger tubes the onset is less abrupt and there is rarely a distinct chill. The characteristic symptoms are cough, dyspnoea, rapid respiration (40 to 80) with an expiratory moan, rapid pulse, and perhaps cyanosis. As the disease affects both lungs, the physical signs are bilateral. There are numerous sibilant and sonorous râles, at first and perhaps all through the disease, without evidences of consolidation. If areas of consolidation sufficiently numerous and confluent exist, there will be slight or even decided dullness, broncho-vesicular or bronchial respiration, and increased vocal fremitus and bronchophony.

These signs are commonly found at the bases posteriorly and on either side of the spine.

The type of the disease varies. In certain cases (suffocative catarrh) the dyspnoea and cyanosis steadily increase, the cough lessens, the respirations become rapid and shallow, and the râles larger and moister. The patient is drowsy, but restless, and death ensues from weakness and overdistention of the right ventricle. The fever in some instances, especially in children, may be of a remittent type and lead to a mistaken diagnosis of malaria. The primary form in infants and young children sets in abruptly with chill and high fever, and bears a close resemblance to lobar pneumonia; in adults it may begin like a severe acute bronchitis, but the fever, cough, and dyspnoea are more marked than in a bronchitis, and the sputum is tenacious and rusty. The secondary form begins as a bronchitis, often of slow development, with increase in the fever of the primary disease (for example, measles), cough, dyspnoea, and rapid breathing.

The duration is variable. Cases of great severity, especially in children, may prove fatal in from three to six days; the common type ending in recovery endures from one to three weeks; exceptionally the disease may be protracted to six or eight weeks, rarely even to ten or twelve weeks. Death may occur at any time. The fever declines by lysis.

In the diagnosis of the disease the cardinal symptoms are fever, cough, dyspnoea, rapid respiration, and bilateral physical signs. Its differential diagnosis from lobar pneumonia has been stated in the description of the latter disease. From the broncho-pneumonic form of pulmonary tuberculosis the distinction may be extremely difficult. A tuberculous family history, progressive emaciation, the finding of tubercle bacilli in the sputum, and the occurrence of the signs of softening, will declare for tuberculosis.

With regard to the prognosis, it is to be remembered that broncho-pneumonia is always a grave disease. The primary cases usually recover; the fatality is greatest in the secondary forms. In children among the well-to-do the mortality varies from 10 to 30 per cent; in hospitals, and among the very poor, from 30 to 50 per cent. Inhalation broncho-pneumonia is usually fatal because of its frequent termination in abscess or gangrene.

Concerning treatment, the utmost importance should be attached to prophylaxis, for instance, the prevention of the spread of an ordinary bronchitis of the larger tubes to the terminal bronchi, especially in children. Perhaps the most important measure of prevention is to keep the patient in an even temperature of 68° to 70° F., and to avoid all depressing agencies, as overfatigue, improper food, etc. The disease, having declared itself, requires in the main the same management as a lobar pneumonia. Opiates, however, should rarely be employed. Local counter-irritation of the chest, poultices, wet compresses, and frictions with stimulating liniments, constitute a much more important element of the treatment than in lobar pneumonia; so also perhaps do the so-called expectorants, such as the ammonium preparations. If the child is unable to expel accumulated mucus the use of an emetic (ipecac, alum) may be desirable.

LUNGS

Pneumoconiosis.—This is a chronic pneumonia due to the inhalation of dusts incident to various employments, and giving rise to anthracosis, or coal-miner's disease; chalicosis, stone-cutter's phthisis, or grinder's rot; siderosis, caused by the inhalation of metallic particles by metal-workers; etc. The symptoms and signs are those of chronic bronchitis with emphysema and fibroid changes. In the later stages the lungs may become tuberculous. The prognosis is favorable in the early stages upon quitting the obnoxious work; in advanced cases grave, although the disease is essentially chronic.

Atelectasis.—Collapse of the lungs—partial or entire disappearance of air from the air-cells—may be congenital, occurring in the new-born as a result of weakness or some form of obstruction in the air passages. The acquired variety is due variously to obstruction of the smaller bronchi by mucus; to compression of the lung by large effusions or tumors in the chest; to respiratory paralysis; or to great abdominal distention.

Emphysema.—The lungs in this disease contain an abnormal amount of air. The common form—hypertrophic emphysema—is characterized pathologically by distention of the air-cells and thinning of their walls. The lungs are large, pale, and do not collapse. Many of the pulmonary capillaries are obliterated, thereby causing obstruction in the pulmonary circulation with compensatory hypertrophy of the right ventricle.

The predisposing cause is a congenital weakness of the lung structure; the exciting cause is increased intrapulmonary tension due variously to chronic or severe cough, heavy lifting, glass-blowing, or using wind-instruments.

The symptoms come on insidiously, often in early life. These are dyspnoea, perhaps only on exertion; cough, ultimately becoming chronic; frequent attacks of bronchitis or spasmodic asthma; and cyanosis, with subnormal temperature and cool skin.

When the right ventricle fails there are swellings of the feet and other evidences of general venous congestion. The physical signs are usually distinctive. Inspection shows the short broad barrel-shaped chest of emphysema, with its vertical movement, poor expansion, and prolonged expiratory motion. Usually there is a marked epigastric pulsation. The apex-beat is not seen. The percussion note is hyper-resonant, even slightly tympanic. The normal limits of pulmonary resonance are extended in every direction. The characteristic auscultatory finding is that of a low-pitched, often wheezy, greatly prolonged expiratory sound. The inspiration is short and weak. Bronchitic râles, at times in great frequency, are often heard.

The course of the disease is essentially progressive and chronic. It is incurable, although the patient may live to old age. Death may occur from intercurrent pneumonia or phthisis, or from failure of the right heart.

The treatment is that of chronic bronchitis (q.v.). When practicable, the subject should live in a warm equable climate in order to avoid recurrent acute bronchitis. The bowels should be kept regular, and the diet carefully supervised to avoid abdominal distention. Inhalations of oxygen, and appropriate treatment by compressed and rarified air, may be helpful.

Strychnine, iron, and digitalis are of much service when judiciously employed; so also are the arsenic and iodine compounds.

Abscess of the Lung.—An acute suppurative inflammation caused by pus-producing organisms. The pus collections may be single or multiple. The organisms may reach the lung by way of the bronchi, as in an inhalation pneumonia; or by infective emboli (see EMBOLISM); or by direct extension, as from a purulent pleurisy. Very rarely it is a sequel of an ordinary broncho-pneumonia or lobar pneumonia.

The symptoms are chills, high and irregular fever, sweats, and leucocytosis. In time the physical signs of cavity are manifest. The sputum is yellow or green, of an offensive, but not putrid, odor, and contains particles of lung tissue and elastic fibres.

The prognosis is usually hopeless. There are occasional recoveries in the cases following pneumonia (except of the inhalation type), or the penetration of external abscesses into the lung. If the abscess is single and accessible, operation may be successful.

Gangrene of the Lung.—A result of infection of a necrotic portion of lung by the bacteria of putrefaction, conjoined with an abnormal vulnerability of the tissues. Diabetes and long continued fevers predispose; pneumonia (particularly inhalation-pneumonia), tuberculous cavities, new growths, embolism, and abscess, are the most frequent antecedent conditions.

The symptoms are irregular, generally moderate, fever, with rapid pulse, cough, dyspnoea, and prostration. The physical signs, when present, are those of cavity. The characteristic symptom is the excessively fetid odor of the breath and sputum. The latter contains fragments of lung tissue, elastic tissue, blood pigment, and numerous bacteria. If allowed to stand, the sputum separates into three layers—the uppermost frothy, the middle watery, the lower with a heavy greenish-brown sediment.

The prognosis in the majority of cases is bad. Small strictly circumscribed areas may become encapsulated, the broken down tissue discharging by way of the bronchi. In accessible cavities surgical interference may succeed.

New Growths of the Lung.—The most common forms are carcinoma and sarcoma, usually bilateral and secondary to cancer elsewhere. Associated lesions are pleurisy, enlargement of the tracheal, bronchial, and cervical glands; perhaps also pulmonary gangrene. The symptoms may be latent. Ultimately cough, pain, and dyspnoea appear. The physical signs are variable, depending largely upon the presence or absence of pleural effusion. According to the size and location of the growth pressure symptoms will be present, for example, hoarseness from pressure on the recurrent laryngeal nerve; or distention of the veins and swelling of the face, neck, and arms from the pressure of the growth on the venous trunks in the chest.

The diagnosis depends largely upon the presence of malignant growths elsewhere, or upon the history of the previous removal of such growths. The disease ends fatally with a duration varying from six weeks to two years. CONSUMPTION; CONSUMPTION, PREVENTION OF.

GLENTWORTH REEVE BUTLER, A.M., M.D.
Author of 'Diagnostics of Internal Medicine.'

LUNGWORT—LURAY CAVE

Lungwort. The name of several plants supposed to have medicinal value in respect to diseases of the lungs. One is a lichen (*Sticta pulmonacea*) growing on the trunks of trees in moist sub-alpine countries. In Siberia it is used as a substitute for hops. Another such a plant is a genus of borages (*Pulmonaria*). The narrow-leaved lungwort is *P. angustifolia*, and the common lungwort, *P. officinalis*; the former is wild. These are European; but an American borage, the blue-blossomed Virginia cow-slip (*Mertensia virginica*) is called tree-lungwort in the Southern States, and used by compounders of simples. A near relative is the sea-lungwort (*Pneumonia maritima*). Another is one of the hawkweeds (*Hieracium pulmonarium*), called French or golden lungwort in Canada. Bullock's or cow's lungwort is the great mullein (*Verbascum thapsus*).

Lunn Hemp. See FIBRE.

Lunt, George, American journalist and poet; b. Newburyport, Mass., 31 Dec. 1803; d. Boston, Mass., 17 May 1885. He was graduated from Harvard in 1824, studied law and was admitted to the Essex bar in 1827. He sat in the State legislature, was appointed United States District Attorney by President Tyler and during the Civil War was associate editor with George S. Hillard (q.v.) of the Boston *Courier*. He published 'Poems' (1839); 'The Age of Gold' (1843); 'The Dove and the Eagle' (1851); 'Lyric Poems' (1854); 'The Union,' a poem (1860); 'Origin of the Late War' (1866); 'Old New England Traits' (1873).

Lupercalia, lū-pēr-kā'lī-a, an ancient Roman festival, celebrated annually in honor of Lupercus, an ancient pastoral god of the Italians, afterward identified with the Arcadian Pan, who protected the flocks against wolves and gave them fertility. The festival dates from the earliest period of the history of Rome; it was held on the Lupercal, where Romulus and Remus were supposed to have been nurtured by a she-wolf. The day of celebration was 15 February, which was originally the last month of the Roman year.

Lupine, a genus of annual and perennial herbs and a few shrubs (*Lupinus*) of the order *Leguminosæ*. The species, of which there are about 80, are sparsely represented in the Mediterranean region and in the Eastern United States, but most numerous in the Western and Pacific Coast States. They have usually digitate leaves; pea-like showy blue, yellow or white flowers in terminal racemes; and rather flattened pods containing several large seeds. Several of the species have been long used for forage, for human food, and for green manuring. Many others are grown for ornament. They thrive especially well upon light, dry soils deficient in lime, and are said to fail upon wet and limy soils. They are readily propagated by means of seed, or, the perennials by division, but these cannot be satisfactorily transplanted when once established. The most important species are the blue lupine (*L. hirsutus*), the white lupine (*L. albus*) and the yellow lupine (*L. luteus*), all of Old World origin. The plants are rich in nitrogenous matter and are thus especially useful for stock-food as well as green manure. Like clover, peas and beans they can obtain free nitrogen from the air by means of their root tubercles. The ripe seeds are rich in proteid

substances and but for their bitter principle would probably be more popular as human food than they are even in Europe, where their consumption is enormous. The bitterness may be removed by long soaking in water. In America, though gaining in popularity as soil improvers and forage crops, the plants are seldom grown except for ornament.

Lupus, a generic term used to describe several varieties of chronic localized infiltrations of the skin. The most common of these are *Lupus erythematosus* and *Lupus vulgaris*. The former occurs in slightly elevated, scaly, red patches, varying in size, which show a strong tendency to the production of atrophic scars. It is most common on the face, ears, and scalp, more rarely occurring on the hands and feet. It begins in several isolated or grouped red spots little larger than a pin-head, and having a thin scale. These spots increase in size by peripheral extension, while the surface is partly covered by the grayish scales or thin scar tissue. The color is characteristic, and is violaceous. They may remain small, or may grow large enough to cover the side of the face. Practically nothing is known of the etiology. The comparatively small patches have little effect on health, but the disseminated variety may cause death.

Lupus vulgaris is a chronic disease of the skin, due to its invasion by the tubercle-bacillus; characterized by one or more brownish-red lumps or patches that tend to absorption, ulceration, and scar formation. The disease usually begins in childhood, the most frequent site being the face, particularly the cheek and nose. There may be one or more such spots, but they show no tendency to symmetrical development. After a time slightly scaly patches will form by the coalescence of the tiny red spots. Sometimes the disease has a slow course, for years remaining quiescent; in other cases it suddenly takes on a rapid growth. The erythematous form is treated by superficial caustics. *Lupus vulgaris* being a tubercular disease, hygiene is of great importance, and the X-rays and other powerful rays seem to exert a curative influence on the growths.

Luray, lū-rā', Va., town, county-seat of Page County; on the Norfolk & Western railroad; about 100 miles north by west of Richmond and the same distance west by south of Washington. It is situated in a beautiful valley almost surrounded by mountains; nearby are a number of mineral springs. A spring which flows through the town furnishes water-power. It manufactures flour, lumber, wagons, carriages, and some agricultural implements and wooden ware. It has a distillery and a large tannery. The Luray College for Young Ladies is located here. Pop. (1900) 1,147.

Luray Cave, in Page County, Va., is near the town of Luray, and on the Norfolk & Western railroad. This cave was discovered by Andrew J. Campbell and companions in August 1878. It is in the limestone belt of the Shenandoah Valley, on the western side of the Blue Ridge, and extends under the low spurs of some of the mountains. The area explored underlies about 100 acres. Electric lights have been put in, and they enable one to see the numerous stalactites, the tiers of galleries, nearly 300 feet in height, the various rooms or cavities, the colors from white to yellow, brown, and red,

LURCHER—LUTHER

and the marks which indicate the action of water for ages. Many of the columns are over 50 feet in height, and are hollow; when struck they give out bell-like notes. Many people visit this cave each year.

Lurcher, an English breed of dog, a mongrel between a greyhound and a shepherd's dog, whose size is moderate and coat rough, wiry and usually reddish. It is the favorite dog of game-poachers, and has both keen eyesight and strong powers of scent, as well as great speed.

Lusatia, lū-sā'shī-a, or **Lausitz**, Germany, an extensive region, bordering on Bohemia to the south, Meissen to the west, Brandenburg to the north, and Silesia to the east. It was formerly divided into two independent margravates, Upper and Lower Lusatia. Lusatia was granted to the Elector of Saxony in 1635. In 1815 Lower Lusatia (1,740 square miles), with a large part of Upper Lusatia, was ceded to Prussia (in all 3,200 square miles, with 294,700 inhabitants), and was annexed to the governments of Frankfurt and Liegnitz. The part of Upper Lusatia which remained to Saxony (953 square miles, with population (1900) 405,173) now forms the circle of Bautzen, comprising the eastern part of the kingdom. It is not very fertile, hardly supplying half of the consumption of its inhabitants. Flax is raised in all parts, but great quantities are imported for the use of the manufacturers. Linen, woolen, and cotton are the principal manufactures.

Lush, Charles Keeler, American journalist and novelist: b. La Crosse, Wis., 5 Dec. 1861. He learned the printers' trade, was reporter on Chicago *Evening Journal*, now *Record-Herald*, and Milwaukee correspondent of that paper, 1889-1901. He has published 'The Federal Judge' (1897); 'The Autocrats' (1901).

Lusiad, lū'sī-ād, a celebrated Portuguese epic poem, written by Camoens in 1571 on the establishment of the Portuguese empire in India.

Lusitania, lū-sī-tā'nī-a, Spain, the name of an ancient region which occupied about two thirds of the west coast of the peninsula and extended eastward to the Anas (Guadiana). The inhabitants were warlike and brave, lived upon plunder, and were rude and unpolished in their manners. The Romans had great difficulty in conquering them, being frequently defeated by Viriathus, chief of the Lusitanians, who was captured by treachery and put to death, about 140 B.C., Lusitania shortly afterward coming under Roman control.

Luska, Sidney. See HARLAND, HENRY.

Lus'san, Zélie de, American vocalist: b. New York 1863. Her parents were French, her mother an accomplished singer, and the girl was but nine when she made her first public appearance. After singing at Wagner festivals, she made her operatic debut in 1886, as a member of the Boston Ideal Opera Company, singing in the part of Arline in the 'Bohemian Girl.' She went to London in 1889 and joined the Carl Rosa opera troupe. Her reception in England was marked by great cordiality. In 1894 she made a successful appearance at the Metropolitan Opera House in New York; during the following years sang in Spain and Portugal, and in France. In 1897 and 1899 she again came to

the United States, and her concert tour here in 1902 will be remembered. She has appeared upward of 600 times as Carmen, and among her other favorite roles are Marguerite, in Berlioz's 'Damnation de Faust'; Mignon; Marie, in 'La Fille du Régiment'; Zerlina, in 'Don Giovanni'; and Musette, in 'La Bohème.'

Lustration, in ancient Rome, a ceremony of solemn purification or consecration of the Roman people, by means of an expiatory sacrifice, which was performed after every census. The sacrifice consisted of a bull, a sow, and a sheep or ram. The ram was dedicated to Jupiter, the swine to Ceres, and the bull to Mars. As this lustration took place at the end of every five years, *lustrum* came to signify a period of five years.

Lutangas, loo-tāng'ās, Philippines, a mixed race of Moros and Subanos, inhabiting the island of Olutanga and the neighboring coast of Mindanao. They are Mohammedans. See PHILIPPINE ISLANDS.

Lutayos, loo-tā'yōs, or **Lutàos**, Philippines, a Moro tribe living in the district of Zamboanga, island of Mindanao; their name appears to be a Hispanicized form of the Malay word Orang-Laut. See PHILIPPINE ISLANDS.

Lute, a stringed musical instrument formerly much in use. It originally contained six strings, but the number was gradually increased till it reached 24. The lute consists of four parts, namely, the table, the body, constructed of nine convex ribs; the neck, which has as many frets or divisions; and the head or cross, in which the screws for tuning it are inserted. In playing this instrument the performer strikes the strings with the fingers of the right hand, and regulates the sounds with those of the left. The notes of the lute are generally written on six lines, and not on five. There were formerly various kinds in use.

Luther, Martin, German religious reformer: b. Eisleben, Saxony, 10 Nov. 1483; d. there 18 Feb. 1546. Hans Luther, his father, a miner in very humble circumstances, removed with his family to Mansfeld in 1484, and in the course of time was appointed to a seat in the council. Martin was educated in the deepest respect for religion, and under the severest discipline, his parents practising the most austere lives of virtue and piety. At 14 he was sent to the school at Magdeburg, whence he removed in 1499 to Eisenach. At first he obtained his support by singing songs at the door like many other poor scholars; but was soon taken under the care of a benevolent lady named Ursula Cotta. At school he made rapid progress in Latin and in other studies; in 1501 he entered the University of Erfurt, where his mental ability soon won him distinction among his fellows. In 1505 he received the degree of Master. He was originally destined by his father for the law, but circumstances at this time turned his attention to religious truth, and he began the study of divinity. Then to the surprise and regret of his father came the young man's "great renunciation" and his determination to enter the monastery of the Augustines at Erfurt in 1505. Luther regarded himself as an unprofitable servant, tortured himself with bitter reproaches, and was attacked by a severe fit of sickness, during which one of the elder brothers consoled him and

LUTHER

promised him the forgiveness of his sins through faith in Jesus Christ, a doctrine which Luther afterward declared brought a new light into his soul. He was also much encouraged by Staupitz, the provincial of the Order, who perceived his great talents and encouraged him to continue his theological studies. Staupitz himself had a singularly clear gospel conception of the cardinal doctrines of faith, repentance, the love and holiness of God, and it is no doubt true that Luther owed much of his "insight" into truth and the opportunity to give it expression to the kindly vicar-general. It is also well to remember in considering the life and work of Luther that some of his best and most cherished works—the Epistles to the Romans and the Galatians, his edition of Tauler's 'Theologia Germanica,' and the exposition of the Seven Penitential Psalms were conceived while he was a member of his Order.

In 1507 he was ordained priest, and in 1508, by the influence of Staupitz, Luther was called by Frederick of Saxony to the chair of philosophy at the newly founded University of Wittenberg. He lectured on the Aristotelian philosophy at the University as well as in the monastery, and at the same time began his activity as a preacher. In 1510 he made a journey to Rome on business of his Order. In 1512 he took the degree of doctor of theology. It was shortly after this, in 1514, that Leo X. issued a bull, granting an indulgence to all who should contribute to the rebuilding of St. Peter's church at Rome. Tetzel, a Dominican friar, was chosen by the cardinal archbishop of Mainz, who, jointly with the guardian of the Franciscan friars, was named commissary of the indulgence for Saxony and the north of Germany, to preach the indulgence through this district. It was the preaching of Tetzel which was the occasion of the beginning of the Reformation. Tetzel was preaching at Juterbogk, a few miles from Wittenberg, when, on the eve of All Saints' day, 31 Oct. 1517, Luther affixed his 95 theses to the door of the Schlosskirche, challenging the Dominican friar. Though carefully guarded in their wording, Luther's propositions were clearly contrary, in some respects, to the current doctrine. The 6th thesis denied the power of the keys, and maintained that the pope can only *declare* a sin to be forgiven by God; the 36th, that through true contrition a Christian is freed from all guilt and punishment; the 66th spoke not of abuses, but said of indulgences in general that they were nets to catch money with; but the 71st declared anathema to him who would reject indulgences altogether. It is clear that Luther at this time had no conception of the Reformation as a movement in opposition to the Catholic Church, nor any idea of denying the supremacy of the chair of Saint Peter, but was worked into a fury by abuses which he thought the ecclesiastical authorities were not sufficiently active in regulating, and his zeal carried him to the breaking point with the ancient church. His propositions were condemned as heretical as soon as they appeared. Hoogstraaten, a Dominican of Cologne, Eck at Ingolstadt, and Prierias, an officer of the Roman court, immediately made replies to his theses; but neither argument, invective, the summons to Rome, which he did not obey, nor the mild counsels of Cardinal Cajetan at Augsburg in 1518, and of the nuncio Miltitz at Altenburg in 1519, were sufficient to

induce him to recant. His replies were made with great boldness and determination, and even after his dispute with Eck at Leipsic in 1519, he still maintained the invalidity of indulgences and of the supremacy of the pope. He appealed from the decision of Cardinal Cajetan to the pope, and from the pope to a general council.

In the year 1519 occurred the famous public disputation, at Leipsic, between Luther and Carlstadt on the one side and Eck on the other, upon the questions at issue. The result was barren. Both sides claimed the victory, and the contestants parted unchanged in their respective attitudes. The Leipsic disputation only precipitated a long and bitter controversy, and Luther remained as determined in his opposition as ever. Miltitz tried once more to make peace, and met Luther for a second time at Liebenwerda. But the conference was again without fruit. Luther's position had now grown more and more radical, though as yet there was no formal, complete, and definite rupture with Rome. The controversy by this time had spread throughout all Germany, and princes and people were arrayed in bitter factions over the issue. Early in 1520 Luther appealed to Charles V., who had succeeded the Emperor Maximilian. He also addressed letters to the bishops of Mainz and Merseburg to enlist them in his cause. The bishop of Mainz, in his reply, treated the questions at issue as of a trivial and frivolous character, and the bishop of Merseburg repudiates Luther's position and exhorts him to submit. Among his friends at this time were Willibad Pirckheimer and Albrecht Durer, though they did not follow him when the formal break with Rome came. Ulrich Von Hutten encouraged and urged him forward. Franz von Sickingen and Sylvester von Schaumberg declared their readiness to put a number of armed knights in the field for him, should it be necessary. Two notable books now appeared from his pen defining his attitude: 'To the Christian Nobility of the German Nation,' and the 'Babylonian Captivity.' In the former he proclaims the universal priesthood and declares against any especially instituted priestly order. He also contests the right of the pope to interpret the Bible, which he declares to be free to everybody. He likewise inveighs against the pope's exclusive right to summon a general council. In the 'Babylonian Captivity' he altogether repudiates the doctrine of indulgences, holds that the papacy is nothing but Babylon, and reduces the sacraments to three only: 'Baptism, Penance, and Bread.' The latter work was in preparation when the bull of excommunication against Luther arrived in Germany.

The attitude of Luther was more and more one of outspoken opposition to the pope and to the doctrines of the Church itself, and so far had his opposition now advanced that the Roman authorities decided to proceed to extreme measures to crush it. In October 1520, therefore, the memorable bull excommunicating Luther and his friends was published at Leipsic. His writings were burned at Rome, Cologne, and Louvain. The answer to the papal bull was characteristic of Luther. At Wittenberg 10 Dec. 1520 he burned the bull of excommunication and the decretals of the papal canon. By this act he dissolved all connection with the pope and the Roman Catholic Church. Frederick, the elector of Saxony, doubted whether he should protect

MARTIN LUTHER.

LUTHER

him. But the German noblemen, Hutten, Sickingen, Schaumburg, whom he called upon to defend the new opinions, hailed him as the champion of religious liberty, and offered him the protection of their fortresses and their arms. On 28 January Charles V. opened the Diet of Worms, and commanded Frederick to bring Luther with him to appear before that body to answer for his conduct. Frederick demurred, on the plea of his fear for the safety of his protégé. When, however, Luther's opinion was asked, he declared that he was ready to appear, and that not even illness would hold him back. In the meantime Charles had revoked his command in order to allow the 60 days to pass granted by the bull of excommunication. An other papal bull was issued, however, after the burning of the first, in which Luther was definitely declared a heretic, and an interdict put upon all places harboring him. Summoned a second time before the Diet, he expressed his willingness, if he were granted a safe conduct, which was accorded him by the emperor. He was met by about 2,000 persons on foot and on horseback at the distance of a league from Worms. When the palatine sent a messenger to warn him of his danger he answered "If there were as many devils in Worms as there are tiles upon the roofs of its houses I would go on." Before the emperor, the Archduke Ferdinand, 6 electors, 24 dukes, 7 margraves, 30 bishops and prelates, and many princes, counts, lords and ambassadors Luther appeared, 17 April, in the imperial diet, acknowledged all his writings, and on the following day made his defense before the assembly. He concluded his speech of two hours with the words: "Let me then be refuted and convinced by the testimony of the Scriptures or by the clearest arguments, otherwise I cannot and will not recant, for it is neither safe nor expedient to act against conscience. Here I take my stand; I can do no otherwise, so help me God! Amen." Frederick the Wise conveyed him privately to the Wartburg to save his life. Luther took advantage of this retirement to translate the New Testament into German. But this seclusion continued only 10 months. When informed of the disturbances excited by Carlstadt on the subject of images he could no longer endure restraint, notwithstanding the new outlawry which the emperor had issued against him at Nuremberg; and at the risk of provoking the displeasure of the elector he hastened to Wittenberg, through the territory of George, duke of Saxony, who was one of his most bitter enemies. The sermons which he delivered for eight successive days after his return (in March 1522) to quell the violence of the enraged insurgents in Wittenberg are patterns of vigorous and popular eloquence.

Amidst these disputes and attacks his plans for a total reformation of the Church were matured. In 1523 at Wittenberg he began to revise the liturgy, and in 1524 laid aside his cowl. In 1525 Luther married Katharina von Bora, who some years previously had left the cloister and joined the reformed religion. He prepared, from 1526 to 1529, a new church service, corresponding to his ideas of the doctrines of the gospel, under the patronage of the elector and with the aid of Melancthon (q.v.) and other members of the Saxony Church. His larger and smaller catechisms, to be used in schools, were also of great service. An un-

successful effort was made in 1529, at Marburg, in a conference between Luther and Zwingli, the Swiss reformer, to bring the German and Swiss movements into harmony. But Luther's peremptory refusal to accept Zwingli's views upon the question of the Lord's Supper precluded any possibility of agreement. The Reformation (q.v.) spread rapidly, and the Augsburg Confession, the earliest symbol of Lutheran Protestantism, was drafted by Melancthon from articles prepared by Luther. During all these years he waged a ceaseless polemic against Rome, and made strenuous efforts to establish harmony among German Protestants. The intolerance which he manifested toward the Swiss reformers, because their views differed from his own in regard to the Lord's Supper, show that he was not yet ready to grant that liberty to others which he demanded for himself. He was in this matter the chief cause of the separation which took place between the Calvinists and the Lutherans. The rapidity with which the Reformation advanced after the Confession of Augsburg in 1530 rendered the papal bulls and the imperial edicts against Luther ineffectual. In 1537 Luther wrote the Schmalkaldic articles; he gave no heed to the ambassadors of Brandenburg and Anhalt, who were sent in 1541 by the Diet of Ratisbon to make him more submissive to the Church, and in 1545 he refused to participate in the Council of Trent.

The occasional asperity which he showed in the defense of his faith, however, by no means diminished the merit of his constancy; and an apology may easily be found for the frequent rudeness of his expressions in the prevailing mode of thinking and speaking; in the nature of his undertaking which required continual conflict; in the provocations by which he was perpetually assailed; in his frequent sickness; and in his excitable imagination, evident from the days of his novitiate. The same excitability of temperament will serve to explain those dreadful temptations of the devil which disquieted him. That age regarded the devil with horror as a personage ever active; and those devoted to the cause of God felt themselves constantly obliged to resist attacks of the evil one. Luther himself says "I was born to fight with devils and factions. This is the reason that my books are so boisterous and stormy. It is my business to remove obstructions, to cut down thorns, to fill up quagmires, and to open and make straight the paths; but if I must necessarily have some failing let me rather speak the truth with too great severity than once act the hypocrite and conceal the truth." No one can behold without astonishment his unwearied activity and zeal. The work of translating the Bible, which might well occupy a whole life, he completed, with some assistance from Melancthon and other friends, between 1521 and 1534. This translation takes the same place in Germany as the King James version does in England and the United States with regard to the religious life and literature of the people. Luther equaled the most prolific authors in the number of his treatises on the most important doctrines of his creed. After the year 1512 he preached several times every week, and at certain periods every day; he officiated at the confessional and at the altar, he carried on an extensive correspondence in Latin and German on various subjects with men of rank and of distinguished lit-

LUTHER LEAGUE—LUTHERAN CHURCH IN AMERICA

erary attainments and with his private friends. He gave advice and assistance wherever it was needed and interested himself on behalf of every indigent person who applied to him. In company he was lively, and abounded in sallies of wit and humor preserved in his 'Tischreden' ('Table-Talk'). Luther was no stranger to the elegant arts. His excellent hymns such as 'Ein feste Burg,' 'Aus tiefer Noth,' are well known. His fondness for music, too, was such that he would often relax his mind with composition, with singing, and playing on the flute and lute. Just before his last journey to Eisleben, where he was summoned by the Count of Mansfeld to settle a dispute, he wrote, in a letter to a friend, the following description of his condition: "Aged, worn out, weary, spiritless, and now blind of one eye, I long for a little rest and quietness; yet I have as much to do in writing and preaching and acting as if I had never written or preached or acted. I am weary of the world, and the world is weary of me; the parting will be easy, like that of a guest leaving the inn; I pray only that God will be gracious to me in my last hour, and I shall quit the world without reluctance." His wife died in 1552. Luther's works are partly in German, partly in Latin. Of earlier editions the most complete is that by Walch (1740-53); and of later, the Erlangen-Frankfort editions (German writings 1826-57; Latin writings 1829-86), and that published at Weimar (1883 et seq.). There are separate collections of his letters and his table-talk. Of accounts of his life may be mentioned those by Meurer (3d edition, 1870); Köstlin (4th edition, 1889), English translation (1883); and Peter Bayne (1887). Consult also Beard, 'Martin Luther and His Reformation in Germany'; Tulloch, 'Leaders of the Reformation'; and Lindsay, 'Luther and the German Reformation' (1900). For Roman Catholic view of Luther consult: M. Evers, 'M. Luther, Lebens- und Charakterbild' (1883-91); Verres, 'Luther' (1884); Janssen, 'History of the German People' (1900).

Luther League, The, a society organized in 1895 at Pittsburg, Pa., having for its basis the unaltered Augsburg Confession and receiving into membership any one connected with a Lutheran congregation or a Lutheran institution of learning. Conventions are held biennially. The society publishes a monthly journal ('The Luther League Review'). The organization had a membership of 50,000 in 1901.

Lutheran Church in America. The first Dutch settlers in New Amsterdam, Manhattan Island, in 1623, brought with them the Lutheran creed and church polity, and in 1664 the first Lutheran pastor took up his residence among them. A colony of Lutherans from Sweden and another from Germany were formed in the following centuries; the Swedes settling on the Delaware (1637-42); the Germans being organized and led by Heinrich Melchior Mühlberg in 1742. The church grew rapidly under capable ministers, and synods were formed in Pennsylvania (1748); New York (1786); North Carolina (1803); and Ohio (1818).

The General Synod, which was intended to constitute a Pan-Lutheran Alliance in the United States, was founded in 1820, and its organization was of great benefit in centralizing and strengthening the activities, both domestic and missionary, of the church. In 1860 it comprised 26 synods, but one of the unfortunate results of the Civil War was to cut off from the northern synods all those south of the Potomac, who formed themselves into what is known as the United Synod of the South. In 1866 the General Synod became divided over the questions of conservatism and liberalism, one party desiring to draw closer the distinctive lines of Lutheran doctrine and polity, the other preferring to Lutheran exclusiveness an inter-communion and a fraternal understanding with other denominations. The conservatives withdrew from the General Synod in 1867. Uniting themselves with the extensive Lutheran Synods formed by immigrants from Germany, Norway, Sweden, and Denmark, they formed the General Council which took as the basis of its creed the Augsburg Confession, The Apology, the two Catechisms of Luther, the Schmalkald Articles, and the Form of Concord.

The Lutheran Church in the United States has grown with great rapidity in the North and Middle West. Its largest body is the Synodical Conference which embraces the flourishing Missouri Synod, whose nucleus was formed by those earnest religious exiles who in 1839 left Saxony for the United States and settled in Missouri. The Rev. C. F. W. Walther was appointed their pastor in 1841; a synod was organized in 1847, and in 1872 the Joint Synod of Ohio, with other smaller synods, combined with the Missouri Synod to form the Synodical Conference. In 1881 a controversy arose in the Conference on the subject of predestination, which the general body of the Conference had adopted into their creed; the Joint Synod of Ohio dissenting from these views separated from the Conference and the ten districts which it comprehends set up an independent organization. The Synod of Iowa is another independent Lutheran Church which differs with the Missouri Conference on the question of the ministry, holding that all ministerial power and office reside in the whole church and not in the spiritual priesthood. The United Norwegian Lutheran Church was formed in 1889 out of a number of Norwegian Lutheran bodies, and now stands for one fourth of the Scandinavian population of the United States.

Besides the independent Lutheran churches above enumerated there are three distinct Norwegian and five German Lutheran churches, two Danish synods, one Finnish and one Icelandic synod. While the General Synod is mostly composed of Anglo-Saxon and English-speaking elements, and the United Synod of the South entirely so, the English congregations of the General Council Synodical Conference are in a small minority. Lutherans in the United States are not strictly speaking congregational in polity. Each congregation is generally made by them to be the unit of administrative power both in the representative bodies and in the court of appeal, and from them the synods gain all their authority. But the Missouri Conference and the Joint Synod

LUTHERAN CHURCH IN AMERICA

of Ohio are composed of congregations perfectly independent and self-governing. The synod has no power legislative or judicial over a congregation, but is merely an advisory body whose decisions must be ratified by the congregation before they can be accepted as decrees of the Church. On the other hand the General Synod, the General Council, and the United Synod of the South have more power of independent action than is the case in the Synodical Conference formed by the Missouri Synod with other synods. The congregations delegate their authority to the General Synod, the General Council, and the United Synod of the South. The clergy and lay delegates in these synods have full authority over ministers, and the general bodies which comprise a number of such synods settle the requirements made of ministers before ordination, and all such details of worship as liturgies, hymn books, and manuals of religious instruction. While the Lutheran Church in the United States has its form of public worship, 'The Common Service,' which was first published in 1883 in its present shape, this book was only adopted by the General Synod, the General Council, and the United Synod of the South with the proviso that a simpler form of service containing only the principal parts of that prescribed in 'The Common Service' might be used by congregations as occasion required.

One of the principal characteristics of the Lutheran Church has been its earnestness in providing for the high education and religious training of its ministry. The Lutheran theological seminaries are generally well equipped and their professors bound by the confessions of their several synods. The oldest of them all is the Seminary of the General Synod founded in 1826 at Gettysburg, Pa. The degree of B.A. is required in candidates for matriculation, and the teaching staff comprises five professors, exclusive of lecturers. The Seminary of the Joint Synod of Ohio was opened in connection with the Capital University, Columbus, Ohio, in 1830, its students have all completed a college course before entering, and with regard to teaching it is one of the most conservative institutions in the Lutheran body. The Theological Seminary of the United Synod of the South was originally established by the Synod of South Carolina at Lexington, S. C. It is at present permanently settled at Mount Pleasant, near Charleston, S. C., with a staff of four professors.

The remaining more important Lutheran Theological Schools are Wittenberg Seminary, founded at Springfield, Ohio, in 1842, under the auspices of the Evangelical Lutheran Church; Concordia Seminary, Saint Louis, Mo., established originally at Altenberg in the same State 1839, and presided over for some 30 years by the Rev. Carl F. W. Walther. It has six professors and more students than any other Lutheran seminary in the United States. The Practical Seminary of the Missouri Synod was originally a department of the Saint Louis Seminary, but in 1875 an independent faculty of five professors was gathered together and buildings provided at Springfield, Ill., where it boasts an attendance of above 100 students. The Seminary jointly controlled by the Synods of New York and Pennsylvania was established at Mount Airy, Philadelphia, in 1864. The Augus-

tana Theological Seminary is a Swedish institution and was organized at Chicago in 1860. It was amalgamated with Augustana College, Rock Island, Ill., in 1875, and has three theological professors; it is bilingual and the ministers educated there can generally preach both in Swedish and English. The Chicago Seminary was founded in 1861, chiefly through the energetic efforts and munificence of the Rev. W. A. Passavant. The Norwegian Augsburg Seminary was opened at Marshall, Wis., in 1869 and removed to Minneapolis, Minn., in 1872; while the United Norwegian Lutheran Church has its divinity school, the United Church Seminary, in the same city where it was founded with three professors in 1890. The German Synod of Ohio has likewise a seminary of its own, which after moving its quarters several times finally settled at Dubuque. It has a teaching staff of four professors, one of whom lectures in English. The following are the statistics of Lutheranism in the United States for the year 1903. Total number of ministers, 7,116; congregations, 11,874; communicants, 1,868,502.

In the early days of American Lutheranism isolation and other causes produced a great diversity in the forms and orders of worship in the scattered Lutheran congregations. This was much deprecated by many leading Lutheran divines. It was felt to act as an element of disunion, sometimes of disorder, and in 1881-3 it was decided to compile and secure the authorization of a Common Order of Service "on the basis of the common consent of the pure Lutheran liturgies of the 16th century."

The Service in the Common Service begins with the Confession of Sins, followed by the Declaration of Grace, thus corresponding with the Confession and Absolution with which morning and evening prayer begins in the Anglican Book of Common Prayer. Then comes an Introit with the Gloria Patri, or ascription of glory to the three Persons of the Trinity. Next is the "lesser litany" or Kyrie, followed by the "Gloria in Excelsis," the great liturgic hymns of both Eastern and Western Christianity. Then comes the Salutation and Response. The Collect for the day ushers in the reading of the Epistle, a selection from the writings of the Apostles, and the Gospel—a passage from one of the Evangelists. Very fittingly the Creed, known as the Apostles' Creed, follows the Gospel, after which the principal Hymn of the service is sung. The Lutheran Church is remarkably rich in hymns, and the old airs of the German musicians are often reproduced, while in English-speaking Lutheran Churches the great German hymns of Luther, Rinkart and others are sung in an English version. To the singing of a hymn succeeds the Sermon. The alms of the people are then collected, and after the Offertory the General Prayer is said, the Holy Communion follows. Besides the above described office the Common Service has offices for Matins and Vespers.

LUTHERANISM

Lutheranism. The first of the 95 theses which Dr. Martin Luther affixed to the door of the castle-church of Wittenberg on 31 Oct. 1517, read as follows: "Our Lord and Master, Jesus Christ, saying, Repent ye, would have the whole life of believers to be repentance." This academic act has been generally looked upon as the inaugural act of the Lutheran Reformation, so much so, that 31 October is to this day celebrated by Lutherans in all lands as the Festival of the Reformation. And the thesis quoted above is perhaps the most concise exhibition of Lutheranism extant. The thesis is, as a whole and in all its parts, a positive doctrinal statement. Doctrine, positive doctrine, is, and was from the beginning, of first importance, the groundwork—the very life—of Lutheranism. The first and foremost task of the Lutheran Church is the promulgation and maintenance of sound doctrine. Preaching, in the Lutheran Church, is not primarily exhortation but teaching, and doctrinal preaching is considered the chief element of Lutheran public worship. Even the better part of Lutheran hymnology is preponderantly doctrinal. The great bulk of Luther's voluminous writings is doctrinal, and no other church has so extensive a doctrinal literature as the Lutheran Church. Even its controversial theology partakes of this character. It is true, the Lutheran Church in all its best periods was eminently an *ecclesia militans*; but the subjects at issue were again doctrinal. Perhaps the most masterful polemical work in Lutheran, if not in all Protestant theology, Chemnitz' *Examen Concilii Tridentini*,¹ is also one of the richest storehouses of doctrinal theology.

But doctrine is knowledge communicated. Teaching presupposes or implies a master and a disciple or number of disciples. And of the master Luther says in his thesis: "Our Lord and Master Jesus Christ." No councils nor synods, no traditions of the Church, no Fathers, early or late, not Luther himself, not any of these, nor all of these together, must be acknowledged as empowered to establish articles of doctrine which every disciple is bound to accept. Bound to accept. For the *Master* is also the *LORD*. He comes with authority; his teaching is not human but divine. Christian doctrine is not a product of evolution, nor of human speculation, nor of self-consciousness of the church, but the truth of God set forth by the Fountain of divine truth, who has said, "I am the Truth." He is the one and only authoritative teacher in the church. There is no such thing as an evolution or perfectibility of Christian doctrine. Here the ancient *αὐτοκρατορία*, "He hath said it" is in its place. Here man has no alternative but either to accept or to reject. Here to add or to modify is to adulterate, and to take away or to yield is to deny. Such is the Lutheran concept of the primary source of Christian doctrine.

But the means also whereby such communication of divine knowledge to man is effected is indicated in Luther's thesis when he says: "Our Lord and Master Jesus Christ, saying, Repent ye." Here he refers to an express dictum of Holy Scripture. Christ and the Spirit of Christ taught man in the 16th century and teaches man in the 20th century in and through the written Word. Not by awaiting direct

revelations, not by following the traditions of the Church or the definitions or decrees of its representatives, are we disciples of Christ, but by searching the Scriptures which were written aforetime for our learning. What is clearly taught in Scripture, that and that only is Christian doctrine. That the Bible is the only and sufficient source of Christian doctrine is the formal principle of Lutheranism.

The material principle of Lutheranism, the cardinal doctrine, around which all other doctrines radiate, because it is the central doctrine of Scripture, is also indicated in the thesis. Luther there describes the subjects and disciples of their Lord and Master Christ as believers. According to the Lutheran concept of Christianity and the Christian church it is faith that constitutes a Christian and a member of the church of Christ, which is simply the whole number of all believers. Christianity, as distinguished from all other religions, is that religion according to which salvation is not by works of righteousness which we have done, but by what God has done in Christ, reconciling the world unto himself. And faith is simply the acceptance of this reconciliation. Not as a work of obedience, with any merit of its own, but only as the acceptance of the merits of Christ, faith is saving faith. It is justifying faith inasmuch as, in view and consideration of the merits of Christ accepted by faith, God in his judgment pronounces the believer righteous. And this doctrine, that God justifies the sinner by His grace, for Christ's sake, through faith, is the material principle of Lutheranism, the cardinal doctrine of Lutheran theology. This doctrine is looked upon by the Lutheran Church as *doctrina stantis et cadentis ecclesiae*, the doctrine with which the Church stands and falls.

On the other hand, the doctrine of justification, while the central and ruling doctrine, is not the only doctrine of Lutheranism. According to our thesis, Christ would have the whole life of believers to be repentance. This, too, is a doctrinal statement. Repentance, *μετάνοια*, is a change of heart and mind in man. In his natural fallen state man is wholly evil, spiritually dead in sin, unable to will or to do that which is spiritually good. He cannot, therefore, work his own restoration, nor contribute thereto. But God, prompted by His universal grace, and because of the merits of Christ, the redeemer of all mankind, through the gospel, the ever efficacious and never irresistible means of grace, quickens the sinner into spiritual life, translating him, by the bestowal of faith, from a state of wrath and enmity against God into a state of grace and communion with God. This is the Lutheran doctrine of conversion or regeneration in the stricter sense of the terms. In a wider sense, in which repentance also stands in our thesis, it includes the preservation and growth of spiritual life and its activity in works of the spirit, or sanctification. For while the Lutheran Church maintains that man's salvation is in no sense, manner or measure, his own work, but wholly and solely the work of God, and hence denies the necessity of good works unto salvation, it strenuously asserts that good works are necessary fruits and evidence of faith.

There have been Syncretists, within the pale of the Lutheran Church, who held that the real obstacles to mutual recognition between the

LUTHERANISM

Lutheran Church and others were only two—the doctrines of predestination and of the Lord's supper. But by these assertions Syncretism exhibits itself as thoroughly un-Lutheran in letter and spirit. These differences are indeed, while they stand, insurmountable barriers between the conflicting theologies. But the chasm which separates them is far deeper and wider, a difference of the very fundamental principles which affects a multitude of particular doctrines. The formal principle of Lutheranism is, as we have seen, that of the exclusive authority and absolute sufficiency of the canonical Scriptures in matters of faith. The material principle of Lutheranism is the scriptural doctrine of justification. Lutheranism holds that Christ, the only head and foundation of the church, vested all the rights and powers of the church, the keys of heaven, the power of remitting and retaining sins in his name as his agent, the government and discipline of the church, in the local congregation of believers. Lutheranism maintains that Christ, the only mediator between God and man, has instituted an office in the church, the ministry of the word, for the public administration of the means of grace, that this office is conferred on its incumbent, by Christ's authority through the call of the congregation, and has no power but the power of the word as set forth in the Scriptures, all ministers being equal in rank among themselves. Lutheranism looks upon the Lord's Supper as a means of grace, whereby Christ, by virtue of his words of institution pronounced in the night in which he was betrayed, gives to all communicants his body and blood, really present not by transubstantiation, nor by consubstantiation or the formation of a new substance, but by sacramental union, to be eaten and drunk in, with, and under the consecrated bread and wine, for an assurance of the forgiveness of our sins, procured by his sacrifice on Calvary.

Lutheranism also holds and teaches a doctrine of predestination, not, however, a decree of damnation, but only an election and predestination of the children of God to eternal salvation by faith in Christ Jesus, who is the redeemer not only of the elect, but of all mankind, and by whom the decree of election is determined as by its meritorious cause, and not as an accessory means of execution. Thus, likewise, the gospel and the sacraments, according to the Lutheran concept, are the ordained means, whereby the same universal grace, according to which God earnestly desires the salvation of all men, and, by the power of his Spirit in all cases efficaciously, but in no case irresistibly, exerted through such means of grace, calls, converts or regenerates, sanctifies and preserves to eternal life all those who do not wilfully and obstinately resist the saving grace of God.

Having thus briefly portrayed the nature and principles of Lutheranism, we proceed to a summary sketch of its rise and progress and its spread in the era of the Reformation.

The cradle of Lutheranism was Saxony in Germany. Here, at Wittenberg, the great Reformer taught and preached and wrote under the protection of the Elector Frederick the Wise, and hand in hand with his successors John and John Frederick. The effects of his 95 theses far exceeded the expectations of their author. When Luther published this manifesto, he had no thought of the establishment of a new church.

The very name of Lutherans was not adopted by the free choice of those who bore it, but was solemnly inflicted upon them in a Bull published by Pope Leo X. 3 Jan. 1521. By this Bull Luther and his adherents were excommunicated from the Roman Catholic Church, and when Luther had refused to recant at the Diet at Worms, he and the Lutherans were also politically outlawed by an imperial edict, which exposed them to persecution and the death of confirmed heretics. The execution of this edict was suspended in Germany because of the great headway which the Lutheran movement had by this time made, and for various political reasons, which bound the emperor's hands, and at the Diet at Spire, in 1526, the German princes and representatives formally agreed that everyone should so conduct himself toward the edict of Worms as he would deem himself able to answer before God and His Imperial Majesty.

Luther, who had for a time been concealed by the elector in Wartburg castle, had made good use of his enforced rest by translating the New Testament into German and issuing the first installments of his Church Postil, a collection of sermons, from which hundreds of ministers learned how to preach to the people. After his return and during the subsequent years the Lutheran Church in Saxony was organized along conservative lines. Luther provided the congregations with forms of worship and collections of hymns for public service, catechisms for the instruction of young and old and an extensive religious literature. A system of schools of various grades was established throughout the land and an able ministry was educated at the University. The translation of the whole Bible was completed in the course of years. At a second Diet at Spire, in 1529, a majority made an effort to stay the progress of Lutheranism in Germany, and in spite of the protest of the Lutheran members, from which they were called Protestants, these efforts were continued at the Diet at Augsburg, in 1530. Here, however, the Lutheran princes and cities succeeded in presenting to the emperor and Diet and thus publishing to the world, a statement of their faith and doctrine, the Augsburg Confession, which, in the course of time, was adopted as its fundamental creed by the Lutheran Church the world over. (See DIET.) In the same year an apology of the Augsburg Confession was framed and published, which also gained symbolical standing. Although the transactions of the Diet of Augsburg resulted in another proscription of Lutheranism and the inauguration of measures for its extermination, the political conditions of the Empire continued to be such that the emperor and his party could not venture to proceed against the dissenters, and while Luther lived the progress and spread of Lutheranism continued, not only in Germany, but throughout Europe. Even when, after Luther's death, Charles V. marched his armies against his Lutheran subjects and by fraud and force led away into captivity the two foremost of the German Lutheran princes and began the work of stamping out Lutheranism, these reverses, though causing considerable disturbance also within the Lutheran Church, lasted a few years only. The political conditions having once more turned in favor of the suppressed party, the Lutherans, in 1552, by the Treaty of Passau, secured tempo-

LUTHERANISM

rary recognition as a church of lawful standing in Germany. This recognition was made permanent by the Peace of Augsburg, in 1555. This settlement included the Lutherans only of all those who dissented from the Roman Catholic Church, Zwinglians, Calvinists, Anabaptists, and others, being excluded. It was thus menacing the religious as well as the political status of Lutheranism, when men of influence in Saxony, the Cryptocalvinists, by clandestine operations endeavored to change the Lutheran Church of Saxony into a Calvinistic establishment. At the same time a number of doctrinal controversies threatened to vitiate the orthodox character of the church of the Augsburg Confession, until, by the united labors of Lutheran theologians and princes, sound in doctrine and deeply concerned about the peace of the church and the purity of its doctrine, the last of the great Lutheran Confessions, the Formula of Concord, closed the series of Lutheran standards, all of which, the Augsburg Confession, its Apology, the Smalcald Articles, Luther's Large Catechism, Luther's Small Catechism, the Formula of Concord, together with the three ancient Ecumenical Creeds of all Christendom, constitute the body of Lutheran Symbols, known as the Book of Concord of 1580.

While Germany was the home of the Lutheran Church, Lutheranism obtained a permanent foothold and became the church of the realm in a number of extra-German countries during the period of the Reformation.

In Sweden Luther's doctrine was disseminated as early as 1519 by two brothers, Lars and Olav Petersen, who had studied at Wittenberg. Under Gustavus Vasa, Lars Petersen was made professor of theology at the University of Upsala, and Olav Petersen was the leading preacher at Stockholm. The Bible was translated into Swedish and at the Diets of Westeras, 1527, at Orebro, 1529, and at Westeras, 1544, the organization of the Swedish Lutheran Church as a national church with an episcopal form of government was effected.

The first Lutheran preachers in Denmark were Peter Lille and Hans Tausen. The organizer of the Danish Lutheran Church was John Bugenhagen, pastor of Wittenberg, who came to Denmark in 1537 and prepared the new Constitution, which was adopted at Odense in 1539. Soon after Norway and Iceland were also Lutheranized, and thus the Lutheran Church was permanently established without bloodshed throughout all the Scandinavian countries.

In Prussia the Lutheran Church was planted and made the church of this ancient territory of the German knights under John George of Polenz, bishop of Samland. The new Agenda and Church-Order was introduced in 1525 and 1526, and the new Lutheran University of Königsberg was a colony of Wittenberg, of which Sabinus, Melanchthon's son-in-law, was the first rector.

In Silesia Luther's doctrine was preached as early as 1518. John Hess was called as a Lutheran minister by the city council of Breslau.

In Poland Luther's writings were prohibited. But in 1521 the Bible was translated into Polish. Jacob Knade preached at Danzig. From Danzig Lutheranism spread to Elbing and Thorn,

and by 1548 the Polish Church was preponderantly Lutheran.

In the Baltic territories, Riga, Dorpat, and Reval were Lutheran in 1523, and within two decades the Reformation spread throughout these whole regions.

In Hungary the doctrines of the Reformation were promulgated by men who had been Luther's students at Wittenberg. In 1549 five free cities adopted the Augsburg Confession, and under the influence of the Reformation numerous elementary and advanced schools were opened in cities and villages throughout all Hungary. Merchants who returned home from the fair at Leipsic brought Luther's doctrine to Transylvania, and others, who had been students at Wittenberg, promoted its spread. A Lutheran school was opened at Hermannstadt. From 1533 John Honter labored as "Evangelist of the Lord at Kronstadt," and the Reformation took its course from town to town. In cities and villages and in the open country schools were established, and even in the village schools Latin and Greek were taught. With the schools libraries for the people were connected, and endowments were provided for the support of young men who were willing to study at German universities.

In Bohemia and Moravia a large part of the population embraced the Lutheran faith during Luther's lifetime, and when, after the Reformer's death, the emperor made war against the Lutherans in Germany, the Bohemian Lutherans refused to take up arms against their brethren in the faith.

In the Netherlands, also, the church of the Reformation gained headway, principally through the reading of Luther's works. In Antwerp a great Lutheran movement took place, brought on by the preaching of Flacius and Cyriacus Spangenberg, in 1565 and 1566. But it was not long before Lutheran services were prohibited. The Dutch Reformed Church was organized in 1568 and 1571 and proclaimed the church of the realm in 1583. With the Spaniards in possession of Antwerp, in 1585, the Lutherans scattered and founded congregations in Frankfort, Hamburg, Amsterdam, Leyden, and other cities. Even there they had no rest. In Amsterdam they were antagonized and Lutheran services were again prohibited. Still, the Lutheran congregations continued to enjoy a rapid and steady growth; so much so that a scarcity of ministers began to make itself painfully felt. The Lutherans in Holland had made the great mistake of neglecting the establishing of schools and colleges for the education of ministers, and this eventually brought about their decadence; for the importation of preachers from foreign countries was accompanied by the introduction of unionistic, syncretistic doctrines and practices.

France is another country in which Luther's writings were widely circulated and had great influence in the church. A Lutheran congregation was organized at Maux. Faber Stapulensis, Briçonnet, Jean and Pierre Leclerc were some of the most noted preachers. Lefèvre translated the Bible into French. A sound Lutheran movement promised a bright future for Lutheranism, but the influence of Geneva, the stronghold of the Reformed Church, was very strong in France, and through this influence

LUTHER'S HYMN—LUXEMBURG

the Lutheran movement in France was directed into other channels.

In England Luther's books were read as early as 1519, especially at the universities, where they were of vast influence. Great efforts were made to suppress these books, and they were proscribed very early, but this only had the effect that they were now read more than ever. Thomas Cranmer embraced the Lutheran faith, and, though in many ways inconsistent, he remained a Lutheran in doctrine until the year 1548. A collection of Lutheran hymns was published, being translations of German hymns, most of them Luther's. In 1536 the Augsburg Confession was printed in an exquisite translation by Taverner. In 'Sarcerius' 'Common-places,' a Lutheran handbook of Dogmatic Theology was given the English people. Cranmer, in the same year, at the close of which he abandoned Lutheranism, wrote an extensive explanation of Luther's Small Catechism, in which the first English translation of Luther's Small Catechism by Cranmer's hand was embodied. The death of Henry VIII., whose political ambition had been to make himself the head of the Lutheran League of the continent, the personal acquaintance of many English and Scotch refugees with Calvin at Geneva and the imposing work there being reared, and other reasons contributed to the ascendancy of Calvinism in England and Scotland, and the Lutheran movement became virtually extinct about the middle of the century.

For Lutheranism in America see LUTHERAN CHURCH IN AMERICA, THE.

AUGUST LAWRENCE GRAEBNER,
Professor of Theology, Concordia Seminary, St. Louis, Mo.

Luther's Hymn, a name given to a celebrated German hymn composed by Luther about 1521. It was entitled "Ein feste Burg ist unser Gott."

Lützen, lüt'sën, Germany, small town of Prussian Saxony, nine miles southwest of Leipzig. It derives all its interest from the two battles fought in its neighborhood. The first belongs to the Thirty Years' war, being fought on 16 Nov. 1632, between the Swedes under Gustavus Adolphus, and the imperialists under Wallenstein. The Swedish monarch, having joined his forces with those of Bernard, Duke of Saxe-Weimar, attacked the enemy in a strongly entrenched position. The issue was long doubtful, but the Swedes finally triumphed, though Gustavus fell in the action. The place of his death is marked by a square block of granite, called the Schwedenstein (the Swedes' stone). The second battle was fought 2 May 1813, somewhat farther south, at Gross-Görschen. It was the first important conflict between the allied Russian and Prussian armies and the French under Napoleon in that decisive campaign. The French numbered 115,000, while the allies had only 70,000. Napoleon maintained his position, though at a loss of 12,000 men, against 10,000 of the allies killed and wounded. The allies retreated in good order. Pop. about 5,000.

Lützow, lüt'sō, F., COUNT, Austrian author. He has been chamberlain of the Emperor of Austria from 1881. He has published 'History of Bohemian Literature' (1899); 'Prague,' in 'Mediaeval Towns' series (1901); etc.

Lützow, Karl von, German historian of art: b. Göttingen 25 Dec. 1832; d. 1897. He assisted Lübke (q.v.) in editing 'Denkmäler der Kunst' and in 1867 became professor of the Polytechnicum, Munich. He published 'Munich Antiques' (7 vols., 1861-9); 'Masterpieces of Ecclesiastical Architecture' (1862); 'Monuments of Art,' with Lübke (6th ed. 1892); 'History of German Copperplate and Wood Engraving' (1891). He was the founder, in 1866, of the 'Zeitschrift für bildende Kunst' and edited it till his death.

Luverne, lū-vérn', Minn., village, county-seat of Rock County; on the Rock River, and on the Chicago, St. P., M. & O. and the Chicago, R. I. & P. R.R.'s; about 200 miles southwest of Saint Paul, and 30 miles northeast of Sioux Falls, S. Dak. Luverne is situated in an agricultural region in which are granite quarries and fire-clay deposits. The chief industrial establishments are flour-mills, grain elevators, brick and lumber yards, and creameries. Large nurseries are in the vicinity. The trade is principally in flour, granite, grain, live-stock, nursery products and dairy products. Pop. (1890) 1,466; (1900) 2,223.

Luxembourg, François Henri de Montmorency-Bouteville, frän-swä ön-rè dé môm-mō rôn sē boo-tē-vël lük-sôn-boor, DUKE OF, marshal of France: b. Paris 8 Jan. 1628; d. Versailles, 4 Jan. 1695. He served when young under the Prince of Condé; in 1662 was made a duke and peer of France, and in 1667 lieutenant-general. In 1672 he commanded during the invasion of Holland; and having gained the battle of Senef in 1674, was created a marshal of France. In the war of France against England, Holland, Spain, and Germany he won the three great battles of Fleurus (1690), Steenkerken (1692), and Neerwinden (1693).

Luxembourg (lük'sēm-bërg, Fr. lük-sôn-boor) Palace, a structure famous for its architecture, art gallery and gardens; situated in Paris, in the Rue de Vaugirard. It was begun in 1616 and completed in 1620; was altered in 1790, and was much enlarged in 1836. At this latter date a magnificent semicircular hall was built for the session of the House of Peers, and later for the Senate. The Senate hall was burned in 1859, but was soon after rebuilt. The name of the palace is derived from the Duke of Piney-Luxembourg, whose mansion once stood on the same site. From 1870 to 1879, the palace was occupied by the Prefecture of the Seine and the Paris municipal council. Since 1879 it has been again occupied by the Senate. It contains a splendid museum of modern art, the most important contemporary collection in the world. The gardens are of the Renaissance order and the most noted in France.

Luxembourg (Fr. lük-sôn-boor, Ger. look'-sem-boorg), Grand-duchy of, northwestern Europe, an independent state, bounded north, east and south by Germany, southwest by France, and west by Belgium; greatest length, north to south, 55 miles; greatest breadth, 34 miles; area, 998 square miles. It forms part of the plateau of the Ardennes, and has a rugged and mountainous surface, covered in many parts with heaths and morasses, though in general well wooded. Its drainage belongs almost entirely to the basin of the Moselle. Agriculture is limited in extent by the nature of the surface, but

LUXEMBURG—LUZON

the pastures rear great numbers of cattle, sheep, and horses, the last long in high repute for light cavalry. Considerable quantities of iron are smelted from the ore of the duchy. The inhabitants are mostly of German origin, but French is the language of the educated classes and of business. The people are for the most part Roman Catholics. Pop. (1900) 236,543. Luxembourg, in early times formed a part of Germany. In 1354 it was erected into a duchy by Charles IV. In 1814 it was converted into a grand-duchy under the king of Holland. Though governed by the Dutch kings as grand-dukes it was distinct from the kingdom of Holland; and on the death of Willem III. in 1890 it passed over to Adolf, Duke of Nassau. It is included in the German Customs Union, and formerly was a member of the German Confederation. Capital, Luxembourg.

Luxemburg, the capital of the grand-duchy of the same name, situated 117 miles southeast of Brussels and 34 miles north of Metz. Its natural position is so strong, and the different powers into whose hands it successively fell did so much to extend and improve its means of defense, that it was called "the northern Gibraltar." From 1839 till 1866 it was garrisoned for the Germanic Confederation by Prussian troops, but in accordance with the Treaty of London (1867) the fortifications were dismantled, the Prussians withdrew their troops, and the neutrality of the duchy was guaranteed by the great European powers. It is divided into a low and a high town. The former lies along the banks of the Alsette. The latter stands 200 feet higher, on a plateau with precipices on three sides, the surrounding ravine being crossed by great viaducts. The town is well built; contains a town-house, government-house, house of deputies, old cathedral church, Athenaeum, Roman Catholic seminary for priests, grand-ducal palace (rebuilt 1893-4), a handsome public park, etc. It has manufactures of machinery, leather gloves, breweries, dye-works, etc.; and a considerable trade. Luxembourg is the see of a bishop; and during part of the year is the residence of the leading families of the duchy. Its neighborhood abounds with fine promenades and picturesque features of various kinds. Pop. (1900) 20,298.

Luxor, lûk'sôr or look'sôr, Upper Egypt, a village on the right bank of the Nile, occupying the site of ancient Thebes and containing splendid ruins of that historic metropolis. See THEBES.

Luzac, Jean, zhôn lû-zâk, Dutch philologist and publicist: b. Leyden 1746; d. there 1807. He was of a French Protestant family, was educated for the bar at The Hague, and in 1772 became one of the editors of the 'Leyden Gazette,' a journal of European reputation, controlled since 1738 by his father and uncle. For several years subsequent to 1775 he was its sole editor, in which capacity he became known as a friend or correspondent of Washington, Adams, Jefferson, and many eminent Europeans. He subsequently became Greek professor at the University of Leyden, and in 1795 published an address 'De Socrate Cive,' dedicated to John Adams, whose son, John Quincy Adams, had studied under his direction. During the revolutionary troubles in Holland he was forbidden to lecture on Greek history to his classes; and having refused to obey this injunction, was de-

prived of his professorship, which was, however, restored to him in 1802 with an increase of salary. Upon being suspended from his professional functions he received a letter from Washington, expressing sympathy in his behalf, and encouraging him to hope for justice. His 'Lectioes Attice,' a defense of Socrates, was published in 1809.

Luzenberg, loo'zën-bêrg, Charles Aloysius, American physician: b. Verona, Italy, 1805; d. 1858. Leaving Italy for the United States in his 14th year, he subsequently received a medical education at the Jefferson Medical College of Philadelphia. He removed to New Orleans in 1829, where he made a reputation for brilliant surgery and was enabled to establish the famous New Orleans Medical School. He visited Paris in 1832, where his reputation had preceded him, and he was elected corresponding member of the Paris Academy. His most important work in Louisiana (where he took up his residence again in 1834) was the founding of the Society of Natural History (1839), and the Louisiana Medico-Chirurgical Society (1843), by which science has been much fostered and promoted in the South.

Luzerne, lû-zêrn, N. Y., village, in Warren County; on the Hudson River, at the mouth of the Sacandaga River; about 20 miles north of Saratoga and 10 miles southwest of Lake George. Lake Luzerne is in the vicinity. The village is situated in an agricultural and lumbering region, and its chief industries are connected with the manufacture of lumber and with farm products. A bridge crossing the Hudson connects Luzerne with Hadley, a station on a branch of the Delaware & Hudson railroad. The cool climate in this region, in summer, the beautiful scenery, and the opportunities for fishing make it a favorite summer resort. Pop. (1900) 1,341.

Luzon, loo-zôn' (Sp. loo-thôn'), Philippines, the northernmost island of the Philippine archipelago, lying south-southwest of Japan and south-southeast of China. On the north is the Bachi channel, connecting the Pacific Ocean and the China Sea; on the south are the San Bernardino Strait, separating it from Samar, the channels of the Visayan Sea, and the Tayabas gulf, dividing it from Mindoro.

Topography and Physical Geography.—The island is very irregular in shape, elongated from north to south and southeast, and much wider at the north than at the south. It narrows at lat. 14° 30' where the bay of Manila is, and much more at lat. 14° between Lamón Bay and Tayabas Bay, where an isthmus unites the larger and northwestern part of the island with the smaller southeastern part; it is thus divided into three territorial divisions, Northern Luzon, Central Luzon, and Southern Luzon. The length of Luzon is 283 miles from the north coast to Manila, and from there 225 miles southeast to Babulgun Point; at its widest point near the centre of Northern Luzon it is 138 miles wide; at its narrowest point, the isthmus in lat. 14°, 8 miles wide; area, 43,075 square miles, with dependent islands 44,235 square miles. The mountain system of Luzon consists of three large ranges, the nucleus of which is Caraballo de Baler in the province of Neuva Ecija. The Carabellos Occidentales form the watershed of Northern Luzon, and extend about 150 miles near the western coast and parallel with it; the

Sierra Madre range, starting at Carabello de Baler, extends northeast to Cape Engaño; the Carabellos Sur, starting at the same point, extends south to Banahao, then turns to the south-east and terminates near the straits of San Bernardino. This range has several important branches, one ending on the south side of the bay of Baler. Among the more important single mountains the following may be mentioned: Data (8,333 feet), and Burnay (6,376 feet), of the Carabellos Occidentales; Cana (3,830 feet) of Sierra Madre; and Bulusan and Mayón (7,566 feet) of the southern range. The three last mentioned are volcanos, of which Mayón is the most active. Luzon is well watered; the longest river is the Grande de Cagayán, running nearly the whole length of Northern Luzon; three other large rivers traverse this part of the island, and there are numerous smaller streams. The coast is irregular, and there are numerous bays and excellent ports and harbors, especially on the central and southern coasts.

Commerce and Industries.—There are a number of fine roads in Luzon, which centre at Manila, connecting it with remote points; there is also a railroad from Manila to Dáguan. In 1903 three other railroad lines were proposed, one from Manila to Aparri, following the Pam-panga, Magat and Cagayan rivers, another from Manila to Batangas, skirting the west shore of the Bay Lagoon between Muntinlupa and Calamba, and a third from Dáguan to Laoag. All the staple crops of the archipelago grow in abundance, and the chief industries of the island are agriculture, and the development of the products into the advanced forms of manufacture; the mechanical industries are very largely confined to Manila. Luzon is also rich in forests, having all the woods used in building, as well as the gum-producing, medicinal, and dye trees.

Luzon was the first of the Philippine islands to come under the control of the United States; it was the scene of the earliest military operations against the insurgents, and the base of operations for campaigns of occupation of the other islands. The beginning of civil government under the auspices of the United States was coincident with the occupation of Luzon, and the island is now the seat of the authority of civil government as well as of military domination. Civil government has been established throughout the whole island. The provinces into which Luzon is divided are as follows:

Abra.	Lepanto-Bontoc.
Albay.	Nueva Ecija.
Ambos Camarines (Norte and Sur).	Nueva Vizcaya.
Bataan.	Pampanga.
Batangas.	Pangasinán.
Benguet.	Rizal.
Bulacan.	Sorsogón.
Cagayan.	Tárlac.
Ilocos (Norte and Sur).	Tayabas.
Isabela.	Unión.
Laguna.	Zambales.

See PHILIPPINE ISLANDS, and the names of individual provinces.

Lyall, H'al, SIR Alfred Comyn, English author and civil servant; b. 1835. He was educated at Eton, entered the Bengal civil service, and was governor of the Northwest Provinces, India, 1882-7. He has published 'Verses Writ-

ten in India'; 'British Dominion in India'; 'Asiatic Studies'; 'Life of Warren Hastings.'

Lyall, Edna. See BAYLY, ADA ELLEN.

Lyall, James, American inventor; b. Auchterarder, Scotland, 13 Sept. 1836; d. New York 23 Aug. 1901. He was brought to this country as a child; when old enough worked at loom-making in his father's shop; was a soldier of the 12th New York infantry during the early part of the Civil War; and afterward became a manufacturer of jute and cotton goods and of machines. He designed corset-making machinery and produced the first machine-made corsets ever manufactured. He also invented a waterproof varnish, and in the latter part of the war knapsacks and haversacks waterproofed by his process were largely used in the Union army. The Lyall positive-motion loom, for weaving wide fabrics, was invented by him in 1863. Various other inventions of his are much employed in cotton manufacture. He received many medals and decorations, including the gold medal of honor from the American Institute, bestowed on him in 1869.

Lycan'thropy. See WERE-WOLF.

Lycæon, li-ká'ôn, a mythical king of Arcadia, generally represented as a son of Pelasgus by Melibœa, daughter of Oceanus, and described by some as the first civilizer of Arcadia, by others as a barbarian who defied the gods. He became by several wives the father of a great number of sons, so notorious for arrogance and impiety that Jupiter resolved to punish them. Appearing to them at their dwelling in Arcadia disguised as a poor man, they invited him to a repast, at which was served up the flesh of a boy whom they had murdered. The god rejecting the food, transformed Lycæon and all his sons save one into wolves, or according to other accounts destroyed them by a flash of lightning. The flood of Deucalion was said by some to have been a consequence of the crimes of the Lycæonidæ.

Lycæonia, li-k-a-ô'nî-a, Asia Minor, the name of an ancient division which was bounded north, east, south, southwest and west by Galatia, Cappadocia, Cilicia, Isauria and Phrygia, and is now included in the Turkish province of Caramania. Lycæonia is first mentioned in Xenophon's history of the expedition of the younger Cyrus as belonging to the Persian empire. After its conquest by Alexander and his death, it was attached to the kingdom of Syria, and subsequently came into the possession of Eumenes, king of Pergamus, while the other part was ruled by native chieftains. In the latter half of the 1st century B.C. it was conquered by Amyntas, king of Galatia, with which country it passed on his death to the Romans under Augustus, being annexed to the province of Cappadocia. The inhabitants, according to the Acts of the Apostles, spoke a peculiar dialect. They were warlike and skilled in archery. The principal town was Iconium, now Konia.

Lyceum, li-sē'üm, an academy in ancient Athens in which Aristotle explained his philosophy. In modern times the name of lyceum has been given to the schools intended to prepare young men for the universities. In France the term is applied particularly to an intermediate classical school. In the United States the term is only applied to the lecture platform, and is

occasionally used as a title for a public ball or assembly room.

Lych-gate. See LICH-GATE.

Lychnis, lik'nis, a genus of plants of the pink family (*Caryophyllaceæ*) comprising many species well known both as flowering weeds in waste places throughout the northern hemisphere, and as garden ornaments. They have a five-toothed naked calyx, five-clawed petals, ten stamens, and five styles, with flowers generally in terminal corymbs. Ragged Robin, or cuckoo-flower (*L. flos-cuculi*), a fugitive from Europe, is now common in damp meadows in the eastern part of the United States, and has a pretty flower with rose-colored petals; White campion (*L. alba*) is another species naturalized from Europe; as also are the red campion (*L. dioica*), the corn-cockle (q.v.), and some others. Many foreign species are cultivated in gardens, among which are the scarlet lychnis (*L. chalcedonica*) and the mullein-pink (*L. coronaria*). Two or three species are indigenous to Labrador and the Hudson Bay region.

Lycia, lis'i-a, Asia Minor, an ancient maritime province, bounded by Caria on the west, Pamphylia on the east, and Pisidia on the north. Its fertility and populousness are attested by the 27 cities mentioned by Pliny, which formed a confederated republic, with a congress which regulated the public concerns, and a president called the Lyciarch. Lycia was colonized by the Greeks at a very early period, and its historical inhabitants were Greeks, though with a mixture of aboriginal blood. They and the Cilicians were the only people west of the Halys whom Cræsus did not conquer, and they were the last who held out against the Persians. Consult Fellows, 'Account of Discoveries in Lycia' (1841).

Lycium, a genus of shrubby and thorny vines of the order *Solanaceæ*, and allied to *Datura* (q.v.), about 75 species of which are scattered throughout the temperate and warm parts of the world. Of the American species none is noteworthy except one naturalized from Europe called box-thorn or matrimony-vine (*L. vulgare*), which bears funnel-form flowers, purplish changing to greenish, and red ovate berries.

Lycomedes, lik-ō-mē'dēz, legendary king of the island of Scyros. He was the son of Apollo and Parthenope, and Thetis gave to him the charge of her son Achilles, disguised in woman's apparel, to prevent his going to the Trojan war.

Lycoperdaceæ, li'kō - pēr - dā'sē - ē. See FUNGI.

Lycophron, li'kōf-rōn, Greek poet and grammarian: b. Chalcis, Eubœa, 3d century B.C. He lived at Alexandria, under Ptolemy Philadelphus (283-247), whose favor he won by the invention of anagrams. Of all his writings there remains but one tragedy, 'Cassandra' (Alexandra), written in iambics. It has no pretensions to poetical merit, and is but a cumbrous store of learning and obscure allusions. It is, properly speaking, a continued soliloquy, in which Cassandra predicts the fall of Troy, and the fate of all the heroes and heroines who shared its ruin. It affords some information of value respecting antiquities and mythology.

Lycopodiales. See FERNS AND FERN-ALLIES.

Lycopodium, the principal genus of club mosses (q.v.), containing many species of the northern hemisphere, of which several belong to the United States. They are low creeping evergreen plants. A common example is the ground-pine (*L. clavatum*), which creeps upon the ground in heathy tracts with long branching stems. *L. rubrum* is a violent cathartic, and has been used successfully in Spanish America in cases of elephantiasis. *L. clavatum* and *L. selago* excite vomiting. The yellow powder contained in the spore-cases of all the species is very inflammable, and is employed in the manufacture of fireworks, and in the flashing of torches or production of mimic lightning on the theatrical stage. It is also employed to cover pills, so as to prevent them being acted upon by moisture, and is known in England under the name of lycopode or vegetable brimstone, and in Germany as *Blitzmehl* or *Hexenmehl* (lightning meal or witches' meal). Many of the species are prized for their beauty, and are cultivated in hot-houses or fern-cases, where they thrive well.

Lycurgus, li-kēr'gūs, Spartan lawgiver; flourished in the 9th century B.C., according to the commonly received traditions. He was the youngest son of the Spartan king Eunomus. His eldest brother, Polydectes, succeeded his father in the government, but died soon after. His wife proposed to Lycurgus to destroy her unborn child by her late husband, if he would share the throne with her. When she gave birth to a son, Charilaus, Lycurgus proclaimed him king, and became his guardian. Being desirous of examining the political constitutions of other lands, Lycurgus left Sparta. On his return the entire community requested him to draw up a constitution for them. He undertook the task. The old constitution was completely remodeled; the highest position in the state was to be shared by two kings, whose powers were counterbalanced by a senate (*gerousia*). The people obtained a voice in public affairs. The native race or Lacedæmonians were confined to the pursuits of trade, commerce, and agriculture; the Helots or slaves to all those mental employments which a freeman would consider as a disgrace, while the Spartans became the warriors of the state. Lycurgus also introduced a redistribution of property. Obtaining from the god at Delphi an approving oracle for his institutions, he exacted a promise from his countrymen not to make any alterations in the laws before his return from a journey he was about to make. He then left Sparta, determined to finish his life in voluntary exile, in order that the Spartans might be bound by their oath to preserve his constitution inviolate for ever. The time and place of his death are unknown.

Lycurgus, one of the ten Attic orators: b. Athens 396 B.C.; d. there 325 B.C. He was a pupil of Plato and of Isocrates. In 343 he was sent with Demosthenes on an embassy to counteract the intrigues of Philip. He won his chief glory as guardian of the public revenue 338-326 B.C. The decree of the Athenians commending his administration of this trust (307 B.C.) is still extant. He was also appointed superintendent of the city, and censor, and in the latter capacity caused his own wife to be fined for violating one of his sumptuary enactments. Of the prosecutions which he conducted, the most celebrated was that against Lysicles, who had

commanded the army of Athens at Chæronea; Lysicles was condemned to death. There were 15 orations of his extant in the ages of Plutarch and Photius, but all have since perished except that against Leocrates, and some fragments.

Lydekker, Richard, English naturalist: b. 1849. He was educated at Cambridge University and was a member of the staff of the Geological Survey of India 1874-82. He prepared for the British Museum in 1884 a catalogue of the fossil mammalia, reptilia and birds therein, and was in Argentina, 1893-4, to examine the mammals in the La Plata Museum. Among his numerous publications are: 'Phases of Animal Life'; 'Geological History of Mammals'; 'The Deer of All Lands' (1898); 'Wild Oxen, Sheep, and Goats of All Lands, Living and Extinct' (1898); 'Descriptions of South American Fossil Animals.'

Lyddite, a high explosive which was adopted by the English government in 1888 for charging its torpedo-shells. Its composition has been varied from time to time, but a typical formula is picric acid 88 per cent, dinitrobenzene 8 per cent, and vaseline 4 per cent. These materials are melted and mixed together in a water-bath, and while in the fused condition they are poured into the shells, where, on cooling, they solidify to a stone-like mass. A central canal is left in the explosive charge in which is placed a detonator containing ammonium picrate by which the charge is exploded. This explosive was practically tested in the Boer war and the results were very disappointing. It is, however, still believed to be an efficient explosive for use against armor. The explosive owes its name to the fact that the first experiments made with it were carried on in the environs of the village of Lydd in England.

CHARLES E. MUNROE,
*Professor of Chemistry, Columbian University,
Washington, D. C.*

Lydgate, lîd'gât, **John**, English monk and poet: b. Lydgate, Suffolk, about 1370; d. Bury St. Edmunds about 1450. After studying at Oxford, and visiting France and Italy, he entered the monastery of Bury St. Edmunds, and established a school for instructing the sons of the aristocracy in versification and composition. He began to write about 1400. His chief works are his 'The Falls of Princes' (1430); 'Story of Thebes' (1420); and 'Historie, Siege, and Destruction of Troye' (1430). His minor poems were published by the Percy Society in 1840. Ritson, in his 'Bibliographia Poetica,' gives a complete catalogue of his works. Lydgate was an admirer of Chaucer, whom he imitated in 'The Story of Thebes,' a Canterbury Tale in ten-syllabled couplets.

Lydia, lîd'î-a, Asia Minor, the name of an ancient large and fertile country, inhabited along the coast of the Ionian Sea by the Ionians. Toward the south it was separated from Caria by the Mæander (now Meander); toward the east it was bounded by Phrygia, and on the north by Mysia. It was in early times a kingdom, divided from Persia by the river Halys (now Kizil Irmak). Its original inhabitants were a people called Mæonians, either of Semitic or of Indo-Pelagic origin. This race was subdued by the Lydians, a Carian tribe. It attained its highest prosperity under the Mermnadæ dy-

nasty, beginning with the semi-mythological Gyges (716 B.C.), and ending with Croesus (546 B.C.), who was conquered by the Persians under Cyrus. The people were the richest and perhaps the most effeminate in all Asia. They delighted in luxurious garments, costly carpets, precious ointments, and exquisite viands; and a kind of Grecian music called the Lydian. They also laid out beautiful gardens. Their example corrupted the Ionians. The wealth of the Lydians, however, was probably, in a great measure, confined to the kings and chief men. These could fill their coffers with the gold washed down by the Hermus (now Sarabat) and the Pactolus, and that obtained from the mines; and they procured all the necessities of life by the labor of their slaves. The Lydians are said to have been the first to coin money, and to establish inns; they are credited with the invention of certain musical instruments, the art of dyeing wool (which was afterward carried to such perfection in Miletus), also the art of melting and working ore. At Sardis, the capital of the country, the Grecians, Phrygians, and even the nomadic tribes bartered their goods. There was here a great market for the slave-trade, which furnished the harems of Persia with eunuchs. The great tumuli graves of the ancient Lydian kings are still to be seen near the Gygaean Lake.

Lye, lî, a solution of an alkali; water impregnated with alkaline salt imbibed from the ashes of wood. It is largely used in soap-making.

Lyell, lî'êl, **Sir Charles**, English geologist: b. Kinnordy, near Kirriemuir, Forfarshire, Scotland, 14 Nov. 1797; d. London 22 Feb. 1875. He was educated at Oxford, and on leaving Oxford he began to study for the bar and became a barrister. His life was almost wholly given, however, to geology. His first writings on the subject consisted of contributions to the 'Transactions' of the Geological Society, of which he was secretary 1823-6, and president in 1835-6 and 1849-50, and to which he continued to furnish papers throughout his life. His first important work, and the one on which his fame rests, 'The Principles of Geology,' appeared 1830-3. A portion of it subsequently formed the basis of a separate work, 'The Elements of Geology' (1838). In the prosecution of his geological studies Lyell made four visits to North America, in 1841-2, 1845-6, 1852, and 1853. His 'Travels in North America' (1845), and 'Second Visit to the United States' (1849), although mainly devoted to geological topics, contain many entertaining sketches of political and social life and institutions. On the occasion of his first American visit he lectured before the Lowell Institute in Boston and again 1845-6. In 1863 appeared Lyell's last important and most popular work, 'The Antiquity of Man,' containing a summary of all the facts and arguments that could be obtained from geology, archaeology, etc., to prove that man had existed upon the earth at a period vastly more remote than usually believed. In 1864 he was president of the British Association. In 1848 he was knighted, and in 1864 was made a baronet. Lyell was a strong supporter of the 'uniformitarian' theory of geology—the steady and long-continued action of forces still at work around us—as opposed to those who believe in great cataclysms or convulsions having taken place in the past. Consult 'Life, Let-

ters and Journals of Sir Charles Lyell' (1881); Geikie, 'The Founders of Geology' (1897).

Lygo'dium. See FERNS and FERN-ALLIES.

Lytle, lil, William, Scottish-American poet: b. Edinburgh, Scotland, 17 Nov. 1822. He emigrated to the United States and settled in Rochester, N. Y. His poems have had a wide circulation in the United States and Canada. Among his most popular Scotch dialect poems is 'The Grave of Three Hundred.' He also wrote several English poems, including 'Diotima.' 'The Martyr Queen' appeared in 1888.

Lyly, lil'i, John, English author: b. about 1554; d. London 30 Nov. 1606. He was graduated from Magdalen College, Oxford, studied also at Cambridge, wrote plays for the children's companies of the Chapel Royal and St. Paul's, London, took side with the bishops in the Mar-Prelate controversy and sat in Parliament for Hindon in 1589, for Aylesbury in 1593 and 1601, and for Appleby in 1597. It is, however, for his 'Euphues' (Part I., 'Euphues, the Anatomy of Wit' 1579; Part II., 'Euphues and his England' 1580) that Lyly is best known. This work is a tedious narrative of the fortunes and interests of a young Athenian, and is remarkable for a prose style that exhibits a uniform and continuous affectation of epigram and antithesis. This fashion of writing, styled 'Euphuism,' was much in favor at the court of Elizabeth, influenced numerous writers, and may fairly be assumed to have been ridiculed by Shakespeare. His plays, 'Alexander and Campaspe' (1584), 'Endymion' (1591), and 'Midas' (1592), contain some worthy lyrics.

Lyman, li'man, Azel Storrs, American inventor: b. Potsdam, N. Y., 1815; d. 1885. He was graduated at the Illinois University and had intended to become a Presbyterian clergyman, but deafness prevented the fulfilment of this purpose. Removing to New York he prepared a historical chart subsequently adopted in many schools and colleges, and also contributed to scientific periodicals. His talents for invention having developed themselves he devised important systems of refrigeration, and a new process of ventilation. He also invented a fibre gun for disintegrating wood for paper pulp, which is extensively used, and among his later inventions is the multi-charge cannon known as the Lyman-Haskell gun.

Lyman, Benjamin Smith, American geologist and mining engineer: b. Northampton, Mass., 11 Dec. 1835. He was graduated at Harvard in 1855; taught for several years; in 1859-61 studied at Ecole des Mines, Paris, and then spent a year at the Mining Academy in Freiberg, Germany. In 1858 he became assistant State geologist of Iowa, and in 1870 was employed by the government of India in surveying oil-fields. From 1873 to 1879 he was chief geologist and mining engineer to the Japanese government, and served as assistant State geologist of Pennsylvania, 1877-95. His geological researches have taken him over an unusually wide area of the globe. He has published more than 100 reports and papers on geological subjects, surveying, etc., among which may be mentioned his 'Preliminary Report on the First Season's Work of the Geological Survey of Yesso' (1874); 'A General Report on the Geology of Yesso' (1877); 'A General Report on the Puna-

jaub Oil Lands' (1878); and 'Geological Survey of Japan.'

Lyman, Chester Smith, American astronomer: b. Manchester, Conn., 13 Jan. 1814; d. New Haven 29 Jan. 1890. In youth he was self-taught in astronomy and other branches of science, making for himself serviceable apparatus. He calculated eclipses 15 years ahead and computed almanacs for 1830-1. He was graduated at Yale in 1837, and studied theology there after a previous course at Union Theological Seminary. After a short pastorate (1843-5) at New Britain, Conn., he went to the Sandwich Islands, where he became instructor at the Royal School. Two years later he was surveying in California. In 1850 he returned to the East and resumed his early study of sciences; in 1858 accepted the professorship of industrial mechanics and physics at Yale; from 1871 to 1884 was professor of astronomy and physics in the Sheffield Scientific School, which he had assisted in organizing; and continued to teach astronomy alone until 1889. He made a number of useful scientific inventions, and was a contributor of papers to the 'New Englander' and the 'American Journal of Science.'

Lyman, Joseph Bardwell, American agriculturist: b. Chester, Mass., 6 Oct. 1829; d. Richmond Hill, L. I., 28 Jan. 1872. In 1867 he became agricultural editor of the New York *World*, was editor of 'Hearth and Home' in 1868, and later joined the staff of the *Tribune*. With his wife he wrote 'The Philosophy of Housekeeping' (1867). He published: 'Resources of the Pacific States' (1865); 'Women of the War' (1866); 'Cotton Culture' (1867).

Lyman, Phineas, American soldier: b. Durham, Conn., about 1716; d. West Florida, now Mississippi, near Natchez, 10 Sept. 1774. He was graduated at Yale in 1738, and subsequently practised law in Suffolk. In 1755, being commander-in-chief of the Connecticut militia, he served with Sir William Johnson at the battle of Lake George, and, after his commander had been disabled, conducted the engagement to a prosperous conclusion. He was present at the attack upon Ticonderoga by Abercrombie, and at the capture of Crown Point and the surrender of Montreal; and in 1762 commanded the provincial troops in the expedition against Havana. Subsequently he passed many years in England in efforts to procure a grant of land on the Mississippi for the purpose of establishing a colony, and in 1775 embarked with his eldest son and some others for the country in question. The emigrants who followed him encountered many misfortunes, and after the subjugation of the country by the Spaniards in 1781-2 were obliged to take refuge in Savannah.

Lyman, Theodore, American philanthropist: b. Boston 20 Feb. 1792; d. Brookline, Mass., 18 July 1849. He was graduated from Harvard in 1810, studied at the University of Edinburgh in 1812-14, was for a time aide-de-camp to the governor of Massachusetts, in 1823-7 commanded the Boston brigade of the State militia with rank of brigadier-general, was a representative in the State legislature in 1821-4 and 1825, and State senator in 1824. In 1834-5 he was mayor of Boston; and on 21 Oct. 1835, at the risk of his own life, rescued William Lloyd Garrison from the 'gentlemanly mob' that had vowed to bring the Abolitionist to the tar-kettle before

LYMAN—LYMPHATIC GLANDS

dark. From 1835 he devoted himself to philanthropic work, and in 1844 removed to Brookline, Mass. In 1840-6 he was president of the Boston Farm-school. To this institution he gave \$10,000; to the Massachusetts Horticultural Society, of which he was a life-member, \$10,000; and to the State reform-school, now the Lyman school, at Westboro, \$72,500. He wrote: 'Three Weeks in Paris' (1814); 'The Political System of Italy' (1820); 'The Hartford Convention' (1823); 'The Diplomacy of the United States with Foreign Nations' (1828).

Lyman, Theodore, American naturalist: b. Waltham, Mass., 23 Aug. 1833; d. Nahant, Mass., 9 Sept. 1897. He was a son of Theodore Lyman (1792-1849) (q.v.). He was graduated from Harvard in 1855, from the Lawrence Scientific School in 1858, and was assistant in zoology at the Museum of Comparative Zoology. In 1863-5 was volunteer aide on the staff of General Meade, with rank of lieutenant-colonel. Having been mustered out on 20 April 1865, he was fish commissioner for Massachusetts in 1865-82, and in that capacity made the first experiments undertaken by any State of the Union for the cultivation and protection of food-fishes. In 1883-5 he served in Congress as an Independent representative. He was also president of the Boston Farm-school, a member of the National Academy of Sciences (from 1872), and a trustee of the Peabody education fund. He donated \$10,000 to Harvard and his library of scientific works to the Museum of Comparative Zoology. Among his publications are: 'Illustrated Catalogue of the Ophiuridæ and Astrophytidæ in the Museum of Comparative Zoology' (1865), with a 'Supplement' (1871); 'Old and New Ophiuridæ and Astrophytidæ' (1869); 'Papers Relating to the Garrison Mob' (1870); 'Prodrome of the Ophiuridæ and Astrophytidæ of the Challenger Expedition' (1878-9); and 'Report on the Ophiuridæ Dredged by H. M. S. Challenger during the Years 1873-6' (1882).

Lymph, the fluid contained in the lymphatic glands and in the lacteals (q.v.). It is elaborated primarily by the assimilation of food, and is also obtained from the blood and tissues, the system of vessels in which it is contained ramifying throughout the bodies of vertebrates. The clearest and simplest view of the nature and functions of the lymphatic vessels is that which considers them as forming a connecting-link between the digestive and circulatory systems. The matters absorbed from the alimentary canal and from the blood and tissues are converted in the lymphatic glands into lymph, which supplies initial and essential elements of the blood. The lymphatic system, concerned in absorption, is also called the absorbent system. None of the invertebrates have such a defined set of vessels; in the lower animals matters pass from the digestive system into the blood-system directly and without the intervention of any absorbent vessels. The lymphatic vessels constitute a distinctive character of the highest sub-kingdom of animals. Fresh supplies of nutritive matter are poured from the lymphatic system into the current of circulation, but it is difficult, if not impossible, to determine where the function of circulation ends and that of absorption begins.

The lymph as it exists in the lymphatic vessels is a colorless, transparent fluid, odorless,

with a slightly saline taste and an alkaline reaction. When microscopically examined, it is seen to be a clear plasma containing corpuscles. It resembles blood in being an alkaline fluid, and in that it coagulates or clots by the separation of the fibrinous part of the plasma; but it differs from blood in that its corpuscles are nearly all colorless, and because its solid matters are present in very small proportions. The lymph-corpuscles, when passed into the current of the blood, by a simple change of medium become the white blood-corpuscles, and when partially altered they give origin to red corpuscles. The lacteals absorb the chyle directly from the alimentary canal, and pour it, as rudimentary blood, into the current of the circulation. Then from the body generally the ordinary lymphatic vessels bring the lymph, which is further elaborated in the lymphatic glands, and pour it into the current of the blood. The actual termination of the lymphatic vessels is in the large veins in the neighborhood of the heart. The lymphatic circulation may thus be regarded as corresponding in its general direction to the course of the venous blood.

The lymphatic vessels resemble small veins in their general structure. They are provided with valves permitting the flow of the lymph only toward the large veins near the heart and into which the lymph is poured. The only structures in which lymphatic vessels do not exist are the non-vascular parts, such as the hair, nails, outer skin, and cartilaginous tissues. The flow of lymph toward the heart is induced partly by the general pressure and action of the muscles of the body, the valvular structure aiding its propulsion as in the veins; and to this, as well as to the absorptive power, must be added the action of the contractile muscular fibres of the lymph-vessels themselves.

The fluid employed in vaccination (q.v.) is also called lymph, of which two varieties are distinguished, human and bovine. The term has likewise been applied to various serums made from bacterial cultures for preventive or curative use in certain diseases, especially to those serums known as antitoxins (q.v.). See IMMUNITY; KOCH, ROBERT; SERUM, THERAPY; TUBERCULOSIS.

Lymphatic Glands, small organs, round and smooth and comparatively solid, which form part of the lymphatic system in vertebrates. (See LACTEALS; LYMPH.) Into these, sooner or later in their course, the other lymphatic vessels run, and from them emerge again. The lymphatic glands are highly important structures, since only after passing through them does the lymph contain, in any abundance, lymph-corpuscles. In size the glands may be compared to small almonds, and they are generally arranged in groups. Each gland is entered by a number of afferent vessels which bring lymph to it, while those (efferent vessels) which leave the gland carry lymph away from it. Externally a lymphatic gland presents an envelope of connective tissue, from which the stroma, consisting of a fibrous framework of processes, is prolonged into the interior of the gland. Within the stroma the essential gland-structure is contained. Within the stroma also, as well as within the softer portions or pulp contained in the meshes of the fibrous network, minute blood-vessels are distributed. Corpuscles are added to the lymph

LYNCH

in the glands, while in the composition of its fluid it undergoes further elaboration. The lymphatic trunks of the greater part of the body finally pour their contents into the thoracic duct, a small tube which opens into the current of the blood at the point of junction of the internal jugular and subclavian veins of the left side of the body. On the right side of the body is a still smaller duct which receives the contents of the lymphatics of the right half of the chest, the right arm, and right side of the head and neck; and this smaller lymphatic channel or right lymphatic duct opens into the angle formed by the junction of the right jugular and subclavian veins, similarly to its larger neighbor of the left side. The thoracic duct begins in the upper part of the abdomen, and runs up in front of the spine to the root of the neck, where it opens into the great veins. The receptaculum chyli, or cistern of the chyle, is the dilation at the commencement of the thoracic duct in the abdomen, which receives the contents of the lacteals or intestinal lymphatics. The orifices by which the thoracic duct and right lymphatic duct open into their respective great veins are guarded by valves which permit the lymph to flow from the ducts into the veins, but prevent the flow of blood into the ducts.

The spleen has been considered by physiologists to be merely a ductless lymphatic gland of large size, since it appears to be concerned in the elaboration of the blood, and also to be a place of disintegration of the red corpuscles and a manufactory of the white corpuscles of the blood. And the thymus, another ductless gland, has also been supposed to be connected with the function of blood-elaboration, and thus to be associated with the lymphatic system.

Lynch, Anne Charlotte. See **BORRA**, ANNE CHARLOTTE.

Lynch, Arthur, Irish journalist and author: b. Smythesdale, Ballarat, Victoria, Australia, 1861. He was educated at Melbourne University and the University of Berlin. practised as an engineer, lectured on engineering and scientific subjects at Melbourne, was for a time a journalist in London, was a war correspondent in Ashanti, and twice visited America. During the second Boer war he was colonel in the Irish brigade No. 2 of the Transvaal forces; and upon his landing in Great Britain subsequent to the war was brought to trial for high treason. He was sentenced to death; but this sentence was afterward commuted to life imprisonment. Lynch was elected M. P. for Galway in 1901. Among his books are: 'Modern Authors' (1891); 'Approaches' (1892); 'Our Poets' (1895); 'Religio Athletæ' (1895); 'Human Documents' (1896).

Lynch, Charles, American planter and soldier: b. 1736; d. 1796. He lived on the Staunton River in Virginia, and in support of the revolutionary government in that region during the early part of the war with Great Britain, joined Robert Adams and Thomas Calloway in the punishment and exile of Tories. A frequent method, so says tradition, was to suspend the disaffected by their thumbs until they were willing to exclaim "Liberty forever!" The summary acts of this self-appointed court are generally accepted as the origin of the term lynch-law (from "Lynch's Law"). But whereas the expression is now used almost exclusively of punishment

by death without legal authority, it does not appear that Lynch ever exacted the death penalty.

Lynch, George, English author and journalist: b. Cork, Ireland, 27 March 1868. He went on exploring expeditions in Western Australia and in the Pacific islands; in 1898 he was war correspondent for the London *Daily Chronicle* in the Spanish-American War. He then went to Africa as correspondent for the 'Illustrated London News' during the Boer war, and was wounded at the battle of Reitfontein. He was at Ladysmith during the first part of the siege, and, on attempting to go from there to join General Buller's forces, was captured by the Boers and kept a prisoner for a month. Shortly after obtaining his freedom he returned to England. He was war correspondent for the *Daily Express* and the *Sphere* in the China campaign for the relief of Peking, and later visited southern China and Japan. He has also been special correspondent for the London *Daily Mail* in the United States. He has written 'The War of the Civilisations'; 'Realities'; and 'The Bare Truth about War and Other Things.'

Lynch, Hannah, English novelist: d. January 1904. She was the Paris correspondent of 'The Academy' and published 'Prince of the Glades'; 'George Meredith: a Study'; 'Dr. Vermont's Fantasy'; 'An Odd Experiment'; 'Toledo' in 'Medieval Towns' series; 'French Life in Town and Country'; 'Autobiography of a Child'; etc. She also translated the dramas of Echegaray (q.v.) into English.

Lynch, John Joseph, Canadian Roman Catholic prelate: b. Ireland 1816. He was educated at Dublin and Paris, and ordained to the priesthood in 1843. Three years later he came to the United States, was first engaged in missionary work at Houston, Texas, and then became president of the Lazarist College of Saint Mary the Barren in Missouri. He next went to Canada, where he founded the Seminary of Our Lady of Angels, and in 1860 was appointed bishop of Toronto. He was later made archbishop of Toronto and Metropolitan of Ontario; in 1869 he was a member of the Vatican Council.

Lynch, Patricio, Chilean naval and military officer: b. Santiago Chile, 1824; d. at sea May 1886. He was educated at the Chilean Naval Academy; entered the English navy in 1840 and took part in the Anglo-Chinese War; in 1847 he re-entered the Chilean navy and served during the war against Spain. In 1879-80 he commanded a military and naval expedition against Peru, and ravaged the northern part of that state, destroying a large amount of property. He also took part in the attack against Lima, and was made commander-in-chief of the Chilean army; in the city of Lima he strictly observed martial law, suppressed the Peruvian government, and took Calderon, the provisional president, prisoner, though this act called forth a protest from the United States minister. In 1883 he evacuated the city, having placed Iglesias at the head of affairs. He was made vice-admiral of the navy, and in 1884 sent as minister to Spain. He died on his homeward voyage two years later.

Lynch, Thomas, Jr., American patriot, one of the signers of the Declaration of Independence: b. Prince George's parish, S. C., 5

LYNCH LAW—LYNDHURST

Aug. 1749; perished at sea in the latter part of 1779. He was educated at Eton and the university of Cambridge, and was subsequently admitted a student in the Temple, London. In 1772 he returned to South Carolina, and at the outbreak of hostilities in 1775 was appointed a captain in the first regiment of provincial regulars raised by South Carolina. Being unanimously chosen by the provincial assembly to succeed his father as a member of Congress, he took his seat in that body in 1776, but in a few months was compelled by ill health to retire from active political life. One of his last public acts was to affix his signature to the Declaration of Independence. In the latter part of 1779, as the only means of saving his life, he sailed for St. Eustatius, West Indies, intending to find there a neutral vessel which would convey him to France. The ship in which he sailed was never heard from and is supposed to have been lost in a storm.

Lynch Law, or Judge Lynch, a name for irregular punishment, especially capital, inflicted by private individuals independently of the legal authorities. The origin of the term is doubtful; by some it is said to be from James Lynch Fitz-Stephen, warden of Galway, Ireland, who, about 1526, sentenced his son to death for murder, and to prevent a rescue by a mob, executed him with his own hands without due process of law. By others the term is said to have had its origin in the State of Virginia, where a farmer of the name of Charles Lynch (q.v.) took his own way of obtaining redress for a theft by catching the culprit, tying him to a tree, and flogging him. This mode of administering justice has always prevailed more or less in every country in times of great popular excitement, and is necessarily resorted to in newly settled territories, where the power of the civil government is not fully established. As early as 1768, in the United States the terms "regulating," "regulation," and "regulator" were in use in the Carolinas; illegal whippings were at that time inflicted by the Regulators, and it is claimed that a meeting of the Regulators took place at Lynch's Creek. Whether there is any historical connection between the Regulators of the Carolinas and the Regulators who flourished along the western frontiers where lynch law was well known, in and after 1819, is one of the many obscure points in the early history of lynch law which await elucidation. At first in the United States, "lynch law" was not mob law, as it is now understood. It was orderly, methodical, and fair in its practices, and was strongly opposed to violence or mob rule. Its distinctive feature was simply that its decrees and findings were executed sternly and swiftly on the spot where they had been decided upon. This was true of the conditions in California in 1849 when Judge Lynch held frequent court, and hundreds of culprits were executed between 1849 and 1860, in an orderly manner, with nothing of the mob violence or excitement common in recent years. During the Civil War and afterward, lynching was practised in the Southern States at the instigation of the Ku Klux Klan (q.v.). From 1870 it became an unwritten law in the South to lynch by mob rule every negro charged with rape or assault, or with the murder of a white person. Gradually this practice spread to Northern States, and negroes were not only

"lynched," or hung, but were burned at the stake in Indiana, Illinois, Ohio, and other States. In 1892, there were 241 lynchings in the United States, and of this number 162 were negroes. During 1902 there were 100 lynchings in this country. Rarely is there conviction or punishment of persons who participate in lynchings, owing largely to the sympathy of jurors for the accused. In Kansas and Indiana laws have been passed providing for the suspension from office of sheriffs who fail to protect prisoners from the violence of the mob. The best remedy for lynch law is prompt action by the courts and the prompt execution of sentence after a culprit has been convicted.

Lynchburg, Va., city, Campbell County; on the James River, and on the Norfolk & W., the Southern, and the Chesapeake & O. R.R.'s; about 125 miles west by south of Richmond. The city is situated in a river valley which forms a pass through the mountains. The irregularity of the surface upon which stands the city, the hills, the numerous terraces, the many trees along the streets, the well-built, handsome houses with neatly kept grounds, all make the place most attractive.

History.—Lynchburg was founded in 1786 by John Lynch, but it was not incorporated until 1823. It was early in the 19th century, as now, a distributing centre for places above on the river, and for many settlements and towns south of the James. The Confederates used it as a supply depot during the Civil War. On 18 June 1864 Gen. Hunter, of the Federal army, attacked the city, but was defeated.

Manufactures, etc.—The chief manufactures are iron and brass products, tobacco, cotton goods, plows, wagons, shoes, dyes, bark extract, hardware, flour, and lumber. It has extensive tobacco interests, as a manufacturing and jobbing centre being among the seven leading shoe jobbing centres of the Union. The trade is principally in tobacco, raw and manufactured; coal, granite, and its own manufactures. Lynchburg is the seat of Randolph-Macon Woman's College, and it has four hospitals, and the Miller Female Orphan Asylum. Granite quarries are near by, and large coal fields and iron ore are in the neighboring counties. The river furnishes extensive water-power, which aids in the development of the manufacturing interests of the city.

Government, etc.—The government of the city is vested in a mayor, who holds office two years, and a council. The city treasurer, clerk of the courts, and commissioner of revenue are chosen by popular election, and the other officers are appointed. The waterworks plant is owned and operated by the city. Pop. (1900) 18,891; (1904 est.) 25,368. Consult Cabell, 'Sketches and Recollections of Lynchburg.'

JOHN A. FAULKNER,
Secretary Lynchburg Board of Trade.

Lynde, Francis, American novelist: b. Lewiston, N. Y., 12 Nov. 1856. After many years in the railway service in various capacities, he turned to literature in 1893 and besides contributions to magazines, has published: 'The Helpers: a novel of Colorado Life' (1899); 'A Private Chivalry' (1900).

Lyndhurst, lind'hurst, John Singleton Cop-
ley, BARON, English lawyer and statesman: b.

Boston 21 May 1772; d. London 12 Oct. 1863. His father (q.v.) was the well-known painter of the same name. He was taken to England in early infancy, his parents having gone to reside in London. He was educated at the University of Cambridge, became a fellow of Trinity College, traveled in the United States, was called to the bar at Lincoln's Inn in 1804, and soon gained a high position. In 1817 he ably defended Watson and Thistlewood for high treason, and obtained their acquittal. In 1818 he entered Parliament for Yarmouth, Isle of Wight, which he soon exchanged for Ashburton. In 1819 he became solicitor-general and was knighted. He conducted the prosecution in the trial of Queen Caroline. In 1824 he succeeded to the post of attorney-general, in 1826 was elected for Cambridge, and became master of the rolls. He succeeded Lord Eldon as chancellor in 1827, which post he retained until 1830, and was raised to the peerage as Baron Lyndhurst. In March 1829, he delivered a great speech against Catholic emancipation. During the ministry of Earl Grey (1830-4) he was chief baron of the exchequer. He was a formidable opponent of the reform bill, and in 1834 became a second time chancellor, but in 1835 retired with the Peel ministry. Lyndhurst's speeches and annual reviews of the session contributed greatly to the return to power of the Conservatives in 1841, on which occasion he was a third time raised to the woolsack. He retired in 1846, from which time he took little part in home politics, confining his attention more to matters of foreign policy. For a long time he was virtually the Tory leader in the upper house. Brougham said: "Lyndhurst was so immeasurably superior to his contemporaries . . . that he might well be pardoned for looking down rather than praising." Consult: Sir Theodore Martin's 'Life' (1883).

Lyne, lin, Joseph Leycester, commonly known as "FATHER IGNATIUS," or "IGNATIUS OF JESUS," English clergyman and author: b. London, England, 23 Nov. 1837. After taking deacon's orders, and doing some mission work in London, he conceived the idea of reviving the Benedictine rule in a modern monastic foundation. With this view he built Llanthony Abbey in Wales, where he was joined by a few enthusiasts, though his movement has made no progress at all commensurate with his programme. He is a striking preacher and has visited the United States as a missionary. Among his published works are: 'The Catholic Church of England' (1864); 'Brother Placidus' (1870); 'Leonard Morris, or the Benedictine Monk' (1871); 'Mission Sermons and Orations' (1886); 'Tales of the Monastery.'

Lynn, lin, Mass., city, in Essex County; on Massachusetts Bay, and on the Boston & M., the Boston, Revere Beach & L. R.R.'s; about 10 miles northeast of Boston, and five miles southwest of Salem. Area, nearly 12 square miles. Lynn was first settled in 1629 by Edmund and Francis Ingalls and for a time was called Saugus. It was incorporated in 1630 and chartered as a city in 1850. The city includes what were several independent villages: Glenmere, Highlands, East Lynn, West Lynn, Linwood, Lynmere, and Wyoma. The Lynn harbor is shallow, but it is considered safe. The

three-mile shore-line adds to its attractions. The city is noted for its shoe factories. The annual amount of shoe business is \$40,000,000; and the number of persons employed, 25,000. The General Electric Company's annual business amounts to over \$40,000,000, and the number of employees is about 20,000, over 6,000 of whom are in Lynn. The chief manufactures are shoes, cut leather, shoe machinery, electrical supplies, meters, arc lamps, morocco, and patent medicines. There are 11 banks, six national, three savings banks, and two trust company banks. The combined capital is \$1,600,000. The total deposits in the savings banks amount to \$10,000,000; total in the national and trust company banks, \$6,000,000. The city has the following churches: Methodist, 12; Baptist, 7; Congregationalist, 7; Roman Catholic, 4; Protestant Episcopal, 2; Universalist, 2; Friends, 2; Presbyterian, Adventist, Wesley Evangelical, Pentecostal, Swedish, Lutheran, and Hebrew, each one church.

Some of the principal buildings are Lynn Public Library, which has about 65,000 volumes; Lynn Hospital, the city hall, Lynn Home for Aged Women, and an orphanage. There are two high schools, 101 grammar schools, 120 primary schools, four large parish schools, containing primary, grammar and high school departments.

The annual expenditure for municipal maintenance and operation is about \$1,348,000; the chief items are, schools, about \$245,000; for poor, sick, homeless, and other charities, \$106,000; for police department, \$84,500; for fire department, \$66,000; for waterworks, \$64,500; for city lighting, \$56,000. The waterworks plant opened in 1870, and costing about \$2,500,000, is owned and operated by the city.

The government is vested in a mayor, a board of aldermen (11 members), and a common council of 25 members, who are elected annually. The large majority of the people were born in the United States. Pop. (1890) 55,727; (1900) 68,513. Consult: Newhall, 'History of Lynn, Mass.'

W. R. HASTINGS.

Lynx, a wildcat, distinguished from the larger members of the family *Felidae* chiefly by the shortness of the tail, and the presence of a pencil-like arrangement of hairs at the tips of the ears. It was long customary to regard these cats as constituting a separate genus *Lynx*, to which the North American wildcats, the caracal, and some others, were assigned, but modern zoologists include them with the general genus *Felis*. See WILDCAT. The fur known to trade as "lynx" is furnished by the Canadian lynx, and is described as of a light-brown color, with a light silvery top on the back, that on the under part long, soft, and spotted; about 30,000 to 80,000 are exported yearly from the Dominion of Canada, California, and Alaska to Liverpool, besides what is consumed in domestic trade.

Lyon, li'on, David Gordon, American Assyriologist: b. Benton, Ala., 24 May 1852. He was graduated from Howard College, Ala., and from the University of Leipzig in 1882, and since the latter date has been Hollis professor of divinity at Harvard. He was recording secretary of the American Oriental Society, 1886-95, and corresponding secretary of the Society of Biblical Literature, 1894-9. He has published 'Keilschrifttexte Sargons, König von

Assyrien' (1883); 'An Assyrian Manual' (1886).

Lyon, Mary, American educator: b. Buckland, Mass., 28 Feb. 1797; d. South Hadley, Mass., 5 March 1849. She began teaching at 18, and later studied at the Sanderson Academy, Ashfield, and at the Byfield Academy, near Newburyport, continuing to teach at intervals. In 1821 she began teaching at the Sanderson Academy, and in 1824 became associate principal of the Adams Female Academy at Londonderry, N. H. In 1828, with the principal of this school, she moved to Ipswich, Mass., where they were followed by a number of their pupils, and established a seminary of which Miss Lyon had practically the entire charge for several years. The establishment of a seminary for girls, embodying the same principles of education as the Ipswich school, and at the same time offering its advantages at a low price, became the main purpose of her life; and in 1834 she resigned her position at Ipswich, and, amid great discouragements, undertook the work of founding such a seminary. Aided to some extent by clergymen and others, she succeeded in obtaining contributions, and on 8 Nov. 1837 a part of the buildings having been completed, the school was opened in South Hadley with about 80 pupils, under the name of the Mount Holyoke Female Seminary. She was president of this school for 12 years, during which time it was enlarged, and gained a national reputation for its high intellectual and moral standard. (See MOUNT HOLYOKE COLLEGE.) She wrote 'Tendencies of the Principles embraced and the System adopted in the Mount Holyoke Female Seminary' (1840), and the 'Missionary Offering' (1843). Consult: Hitchcock, 'Life and Labors of Mary Lyon.'

Lyon, Matthew, American politician: b. Wicklow County, Ireland, 1746; d. Spadra Bluff, Ark., 1 Aug. 1822. He went to New York in 1755, and, being too poor to pay for his passage, was bound out by the captain of the ship to a farmer in Connecticut, in whose service he remained a number of years. Subsequently he became a citizen of Vermont, and in July 1776 was commissioned as lieutenant in one of the companies of "Green Mountain boys." He served later as commissary-general, and eventually rose to the rank of colonel of militia. He was one of the founders of Fairhaven (1783), where he engaged in paper-making, iron casting, and other occupations, and at one time edited a newspaper of an ultra democratic character, entitled 'The Scourge of Aristocracy and Repository of Important Political Truth,' of which the types and paper were manufactured by himself. Becoming an active political leader, he was elected in 1797 to Congress by the Anti-Federal Party. In October 1798 he was convicted of a libel on President Adams, and imprisoned for four months, a fine of \$1,000 which had also been imposed upon him being paid by his friends. An attempt to expel him from Congress as a convicted felon failed for want of a two thirds vote. During this congressional term he had a violent altercation on the floor of the House with Mr. Griswold of Connecticut, ending in blows; but the motion to expel them was defeated. In 1799, while a prisoner, he was re-elected to Congress from Vermont. After the expiration of his term he removed to Ken-

tucky, where at the next Congressional election (1803) he was returned to the House, of which he continued a member until 1811. Subsequently he held the office of United States factor for the Cherokee Indians by the appointment of President Monroe, and removed to Arkansas, of which he was the territorial delegate-elect to Congress at the time of his death. Though rough and impetuous in manner, he was an able debater, and to the end of his life continued a man of active business habits.

Lyon, Nathaniel, American soldier: b. Ashford, Conn., 14 July 1818; d. Wilson's Creek, Mo., 7 Aug. 1861. He was graduated from West Point in 1841; served in the Mexican War, 1846-7, being present at the siege of Vera Cruz, and the assault on the City of Mexico; and was on duty in Kansas during the Free State agitation. In February 1861 he was assigned to St. Louis, Mo., where he had charge of the arsenal; he was most active and efficient in the Union cause, organized the Home Guard, and on 10 June 1861 captured Camp Jackson, a rendezvous of the secessionists. Soon afterward he was made brigadier-general of volunteers, and given command of the department. He refused all compromise with Governor Jackson, who sympathized with the secessionists, and in June occupied Jefferson City, the capital of the State, and defeated the Governor's troops at Boonville on the 17th. He then went to Springfield, whence he advanced on 1 August to meet a part of the Confederate army, which was advancing into Missouri under McCulloch; he defeated them at Dug Spring, and returned to Springfield. But the Confederate forces were soon increased by the arrival of the troops under Price, and General Lyon was opposed by an army considerably greater than his own. Unwilling to surrender southwestern Missouri without a struggle, he decided to risk a battle, and accordingly advanced from Springfield to Wilson's Creek, where his troops were defeated, and he himself killed, after a gallant fight. He bequeathed nearly all his property, about \$30,000, to the government to aid in the preservation of the Union. In 1862 a collection of his letters in favor of the Republican party and the election of Lincoln (1860) was published under the title 'The Last Political Writings of General Nathaniel Lyon.' Consult 'Life' by Woodward; Peckham, 'General Nathaniel Lyon and Missouri in 1861'; and Churchill's novel, 'The Crisis.'

Lyons, l'ônz, or **Lyon**, lê-ôn, France, the capital of the department of the Rhône, 311 miles by rail southeast of Paris, and 170 miles north of Marseilles, is the second city of industrial importance, and the third in point of population in the country. It is situated at the confluence of the Saône and Rhône, the central business section being on the tongue of land that projects between the rivers to their junction, and extends northward to the hill of La Croix Rousse; while the ancient mediæval town is on the steep slopes of the Fourvières hill, rising from the west bank of the Saône, and the modern industrial suburb of La Guillotière, with its numerous factories, is on the east bank of the Rhône. Thirteen bridges span the Saône at this point, varying from 250 to 450 feet wide, and nine bridges the Rhône, over 600 feet wide. A series of detached forts crown different heights within a circuit of

LYONS

43 miles, making Lyons, with its extensive barracks and considerable garrison, a defensive position of great strategic importance. The older quarters of the town are crowded, dirty and unhealthy, with narrow, irregular streets, lined by tall, ungainly buildings. The best parts are the 13 miles of magnificent quays, built since the 18th century as a protection against the periodical river floods, and now laid out with finely planted walks, stately mansions, municipal buildings, railroad depots, capacious warehouses, etc. Among the notable squares and open places are the Place des Terreaux, facing which stands the Hôtel de Ville, and the large and handsome Place Bellecour, the fashionable promenade. The chief public edifices are more remarkable for their antiquity than for the beauty of their architecture. The cathedral of St. John on the slope of the Fourvières, on the right bank of the Saône, is in the Gothic style of the 12th century, and has four towers, two of which flank the west front, while the other two, shorter but more massive, form the transepts. Higher up the slope is the modern church of Notre Dame, an imposing composite edifice occupying the site of the *Forum Vetus* built by Trajan. Beside it is a tower or Belvedere 680 feet above the Saône. On the other side of the Fourvières is the church of St. Irenæus, the second bishop of Lyons. The church itself is an uninteresting modern structure, but it stands on the grave of the martyred bishop, and has beneath it the reputed crypt in which Polycarp preached, and 19,000 Christians at a later period were massacred by orders of Septimius Severus, 202 A.D. A little above the cathedral is the Palais de Justice, and lower down on the opposite bank of the Saône is the church of the Abbey of Ainay, beneath whose sacristy, and penetrating below the bed of the river, are dungeons without light or air, in which many of the early Christians were immured previous to martyrdom. Other noteworthy churches are the Church of St. Nizier, of the 14th century, one of the largest in the town; that of St. Bonaventure, the patron saint of Lyons; and the Church of the Chartroux, surmounted by a superb dome seen from all quarters of the city. The archiepiscopal palace, situated near the cathedral, is a large edifice of no architectural merit. The Hôtel de Ville is considered one of the finest edifices of the kind in France. It is an isolated square, and is surmounted by a dome 164 feet high. The public library, occupying part of the buildings of the college on the Quai de Retz, is the best provincial collection in France. The Palais des Arts, facing the Place des Terreaux, is a fine majestic edifice. It contains a picture-gallery, a cabinet of medals, a gallery for statues, and another for ancient stuccoes, a depot of mechanical inventions for the fabrication of silks, with a library attached; a free school of design, and a large hall used as the exchange.

The chief educational establishments are the college, or university, occupying a fine modern building and attended by over 2,000 students in the different faculties; the Martinière, a great school of science and the industrial arts with 500 students; a free Catholic university; various institutions of a special character, such as schools of chemistry and chemical industry, schools of design, of commerce, of weaving; a celebrated veterinary school, the botanic garden, etc. Charitable establishments are large and

numerous. The most important are the Hôtel-Dieu, the Maison de la Charité, the Mont de Piété, occupying the Manécanterie or deanery attached to the cathedral; and the Hospice de l'Antiquaille, on the site of the ancient Roman palace or prætorium, now used partly as a lunatic and partly as a Magdalen asylum, and general penitentiary. There are several prisons—the New Prison, an extensive building, well arranged; the Maison des Recluses, now employed as a military prison; and the prison of Roanne, regarded as a model in its kind.

As a manufacturing town Lyons early acquired and has long maintained a first place. It is the most important centre of silk manufacture in the world, employing directly and indirectly over 200,000 persons. Other manufactures are hats, boots, jewelry, and liqueurs; besides dye-works, foundries, glass-houses, potteries, tanneries, breweries, and chemical works. Lyons is admirably situated for trade, on two navigable rivers, which make it a great entrepot both for the north and the south. It forms the common centre where the highways and railroads from Paris, Marseilles, Bordeaux, from Switzerland, and Italy, all meet; it communicates with the Rhine by the Rhône and Rhine Canal, while several other canals, branching off from its rivers, give it ample means of transport over a great part of the interior of the country. The chief imports are raw silk, wine, brandy, oil, soap, flax, hemp, rice, salt, cotton, wool, coffee, dyes, earthenware, and timber; and the exports, spun-silk and silk-goods ribbons, hats, straw-bonnets, woollens, flannels, linens, corn, flour, chestnuts, liqueurs, paper, hemp, ironware, etc.

As Lugdunum, Lyons was an early Gallic town, and when Cæsar invaded Gaul was a place of some importance; it figures more or less in the subsequent history of the Roman Empire, several emperors in succession making it their occasional residence and vying with each other in adorning it. It early received Christianity, and toward the end of the 2d century numbered thousands of Christians among its inhabitants. Its first bishop, Pothinus, died a martyr in 197, and his successor Irenæus died also a martyr in 202. Lyons was afterward sacked by the Huns and Visigoths, who destroyed many of its noblest Roman structures. In the 8th century it fell for a time into the hands of an army of Saracens from Spain, and suffered severely; but recovered its prosperity under Charlemagne, on the dissolution of whose empire it became the capital of the kingdom of Provence. Subsequently it fell under ecclesiastical domination, and was long governed by a succession of archbishops. In 1312 Lyons was annexed to the crown of France. It owes its new quays and several of its finest edifices to Louis XIV. The revolution of 1793 occasioned fearful reverses. The inhabitants, finding their industry paralyzed and their trade destroyed, rebelled against revolutionary violence, and the convention let loose its forces upon them; wholesale butcheries for many days deluged the town with blood. Since that period questions of an economical, or rather socialist nature, culminated in the sanguinary revolts of 1831, 1834, 1849 and 1871. Several important figures in history were natives of Lyons, among them the Roman emperors Marcus Aurelius, Claudius, and Caracalla, and the celebrated general Germanicus. Pop. (1901) 459,099.

LYRE BIRD.

LYONS — LYSANDER

Lyons, Iowa, formerly an independent city in Clinton County, but incorporated with the city of Clinton in 1895. See CLINTON.

Lyons, Kan., city, county-seat of Rice County; on the Atchison, T. & S. Fe, the Missouri P., the St. Louis & S. F. R.R.'s; about 180 miles west by south of Topeka and 25 miles north by west of Hutchinson. It is situated in a fertile agricultural region in which stock-raising is a prominent industry. Nearby are salt deposits, like that at Hutchinson in Reno County, a remarkably fine salt, obtained from a considerable depth below the surface. Some of its industrial establishments are salt works, grain elevators, gas-engine works, and flour-mills. Its trade is chiefly in grain, salt, live-stock, flour, and corn. The city owns and operates the waterworks. Pop. (1900) 1,736.

Lyons, N. Y., village, county-seat of Wayne County; on the Erie Canal, and on the West Shore and the New York C. & H. R. R.R.'s; about 40 miles east by south of Rochester. Lyons was founded in 1795 and incorporated as a village in 1854. It is situated in a fertile agricultural region, and its extensive water power has contributed to its development as a manufacturing village. Its chief manufacturing establishments are a beet-sugar factory, barrel factory, distilleries of peppermint oil, a pottery, and machine-shops. Slipper-soles and silverware are also manufactured. The Union School Library has about 4,000 volumes. Pop. (1900) 4,300.

Lyons, Councils of, two synods held at the city in France from which they derive their name and considered ecumenical by the Roman Catholic Church. When the quarrel between the Emperor Frederick II. and Innocent IV. had resulted in the banishment of the latter from Rome, the pope summoned a council in 1245 at which the patriarchs of Aquileia, Antioch and Constantinople, as well as the Emperor Baldwin II., were present with several royal delegates. Thaddæus of Susa represented Baldwin, who was, in spite of that delegate's emphatic protests, solemnly deposed, and his subjects released from their allegiance. When Gregory X. took the tiara, his first step was to attempt a reunion of Christendom, as represented by the Greek and Latin churches, which had been parted by schism mainly on the question of the *filioque* (q.v.), and Latin accretions to the doctrine of purgatory. The second Council of Lyons met 1274 under his presidency and the desired union was apparently effected, for both Greek and Latin prelates sang the creed including the clause asserting the double procession. The tie that bound them, however, proved a rope of sand, and the schism has continued to this day. See GREEK CHURCH.

Lyons, Gulf of. See LION OR LYONS, GULF OF.

Lyre, the most ancient of stringed instruments, which originally had but three strings. The Egyptian and Grecian lyres were at first strung with the sinews of animals. The number of the strings was at last increased to sixteen. It was played with a stick of ivory or polished wood, also with the fingers. The body of the lyre was hollow, to increase the sound. Few objects are so graceful in form and susceptible of such various application in the fine arts. As a musical instrument it has now gone out of use

among the civilized nations, though a rude form of it is still to be met with in the hands of the shepherds of Greece and among the negro tribes of Africa. It is the symbol of Apollo.

Lyre-bird, a remarkable Australian bird which derives its name from the form of the tail in the male, which much resembles that of the conventional Apollo's lyre; the tail of the female is rather long, but simply wedge-shaped. There are two species, about the size of chickens, both reddish brown and called "native pheasants" by the colonists, constituting the genus *Menura* and family *Menuridae*, and regarded as the lowliest of the *Passeres*, and of very ancient origin. They dwell in the "scrub" or open woods, and rarely leave the ground, avoiding their enemies by swift running. Their nests are placed upon the ground, are well woven of sticks and plant-stems, and are covered by a dome-like roof, leaving an entrance only at the sides. In the mating season the males scrape up mounds of leaves and rubbish upon which they strut about, sing and do their best to display their long and handsome tails to the hens. The better known species is the long-tailed one (*M. superba*), but both are now rare.

Lyric Poetry, that species of poetry by which the poet directly expresses his emotions. The predominance of feeling in lyric poetry is what chiefly distinguishes it from dramatic poetry, in which action and character, independent of the individual emotion of the poet, predominate; and from epic poetry, of which a series of actions and characters, as contemplated and exhibited by the poet, is the characteristic. It is necessary that the feeling represented should be itself poetical, and not only worthy to be preserved, but accompanied by a variety of ideas, beauty of imagery, and an eloquent flow of language. Milton, Chatterton and Burns are among the better known English writers of lyric poetry.

Lys, lès, or Leye, lî-ě, Belgium, an affluent of the Scheldt, which rises near Lysbourg, Pas-de-Calais, France, and after a northeasterly course of 130 miles, unites with the Scheldt at Ghent, Belgium.

Lysander, lî-săn'dér, Spartan general: d. 395. His father was Aristocritus, a Lacedæmonian of the purest blood, being of Heracæidan descent, his mother a Helot who brought him up in poverty. His fine qualities, however, procured him the command of the Spartan fleet off the coasts of Asia Minor (408). He established his headquarters at Ephesus, which he raised to prosperity. Next year he was succeeded by Callicratidas. In a short time his reputation had so increased that the Asiatic allies of Sparta requested the Lacedæmonians to invest him a second time with the command. Accordingly, Lysander with the title of vice-admiral (405 B.C.), defeated and captured the Athenian fleet off Ægospotamos. This decisive victory put an end to the Peloponnesian war. Shortly afterward he set sail for Athens, which he blockaded. The city was starved into capitulation (404), the long walls and the fortifications of the Piræus were demolished; and the oligarchy of the Thirty Tyrants was established, which governed with terrible cruelty. Lysander then returned to Lacedæmon, where his ambitious and unscrupulous character made itself more palpable than ever. He was excessively

fond of praise, and was the first of their own countrymen to whom the Greeks erected altars, offered sacrifices as to a god, and celebrated festivals. On his return to Sparta Lysander, stung by the ingratitude of Agesilaus, whose succession to the throne he had secured, resolved to destroy the constitution of his country by abolishing hereditary monarchy, making the throne elective, but the Delphic and other oracles were unfavorable, in spite even of his bribes. On the outbreak of the Boeotian war (395 B.C.) he marched against Haliartus and was killed in battle under its walls.

Lysias, λιῥ-ας, Athenian orator: b. about 458 B.C.; d. about 380. He was a son of Cephalus, an orator, of whom Plato makes honorable mention in his 'Republic.' Lysias, at 14 went to Thurium, in Magna Græcia, to study philosophy and eloquence under Tisias and Nicias of Syracuse. Having settled in Thurium, he was employed in the government; but on the defeat of the Athenians in Sicily was banished with many of his countrymen. After Athens had recovered its freedom he exerted himself for the advantage of the city, and sacrificed much of his property for the public welfare. At first he gave instruction in eloquence; but finding himself surpassed by Theodorus, another teacher of oratory, he devoted his time to writing orations for others. He wrote more than 200, some say 400 orations, but only 223, however, were regarded as genuine. His style is applauded as a perfect example of the simple Attic eloquence. Only 34 of his orations have come down to our times. They have been published in various collections of the Attic orators; among the best separate editions of them are those by Baiter and Sauppe (1850); Cobet (1863); Thalheim (1901). See Jebb, 'Attic Orators,' Vol. I. (1880).

Lysicrates, λι-σῖκ'ρα-τζεζ, Monument of, located in Athens; one of the earliest examples of Corinthian architecture. It was dedicated 334 B.C. to Dionysus, by Lysicrates, as a trophy for winning the Dionysian games. The monument, which was built in the form of a round temple was surmounted by a bronze tripod and stood on a cubical base 13 feet high. The building on account of its shape was popularly known as the "Lantern of Demosthenes."

Lysima'chia. See LOOSESTRIFE.

Lysimachus, λι-σῖμ'α-κῖς, general and one of the diadochoi of Alexander the Great: b. Pella, Thessaly, 361 B.C.; d. near Corus 281 B.C. He was a low born Macedonian of great physical strength and courage. On the death of Alexander, 323 B.C., Thrace fell to the share of Lysimachus, who became also satrap of Macedonia in 286. The murder of his son Agathocles, a great favorite of the people, at the instigation of his Egyptian wife Arsinoe, provoked a revolt in Asia; Seleucus, satrap of Syria, took up the cause of the widow of Agathocles, Lysandra, and Lysimachus was killed in the battle near Corus which ensued. He founded a city on the Hellespont, named after him Lysimachi.

Lysippus, λι-σῖπ'ῡς, Greek sculptor who flourished in Sicyon between 360 and 316 B.C. Alexander the Great would permit no one but Apelles to paint his portrait, and no one but Lysippus to make his statue. Lysippus was first a smith, and afterward devoted himself to sculpture, adopting the canon of Polycletes, as

exemplified in that artist's 'Doryphorus.' This canon, or standard of beauty, presents the human form with the head smaller, and the limbs longer and slenderer than in life. His statues were wrought with much greater ideal beauty than those of his predecessors. They were almost all, if not all, in bronze, and he is said to have left behind him some 1,500 works. Several of his more celebrated statues were those of Alexander, the most noted of which represented the Macedonian hero bearing a lance. This was considered as a sort of companion to the picture of Apelles in which Alexander was seen, like a second Zeus, launching a thunderbolt. Among his principal ideal works are the colossal 'Zeus' at Tarentum; 'Phœbus Apollo in his four horse Chariot' at Rhodes; the bronze statue of 'Opportunity' at the entrance of a temple in Sicyon, of which several copies are extant; the colossal bronze statue of 'Hercules' at Tarentum, and the famous 'Athlete,' of which the 'Apoxyomenus' of the Vatican is a copy.

Lyso, a brown, oily liquid, having an odor resembling creosote. It is prepared from tar oil by saponification; is a useful antiseptic for the hands in a 1 or 2 per cent solution, and is chiefly used in obstetrical operations.

Lyte, lit, Eliphalet Oram, American educator: b. Bird-in-Hand, Pa., 29 June 1842. In his youth he served in the Union army during the Civil War. He was graduated from the State Normal School at Millersville, Pa., in 1868, was professor of English and pedagogics there, 1868-87, and has been principal of that institution from 1887. He was president of the National Educational Association 1890-9, and has published 'Practical Bookkeeping' (1883); 'Grammar and Composition' (1886); and other text-books.

Lyte, Henry Francis, English Anglican clergyman and hymn writer: b. Ednam, near Kelso, Scotland, 1 June 1793; d. Nice, France, 20 Nov. 1847. He was graduated from Trinity College, Dublin, and took orders in the Anglican Church, 1815. He was curate of Lower Brixham, Devonshire, 1823-47. He published 'Tales Illustrative of the Lord's Prayer' (1826); 'Poems, Chiefly Religious' (1833); 'Miscellaneous Poems' (1868); 'Memoir of Henry Vaughan'; 'Abide With Me'; 'Pleasant Are Thy Courts'; 'Jesus, I My Cross Have Taken'; and other hymns of his have become widely popular both in America and England.

Lytle, lit'l, William Haines, American general and poet: b. Cincinnati, Ohio, 2 Nov. 1826; d. Chickamauga, Tenn., 20 Sept. 1863. He was graduated at Cincinnati College, studied law and practised for a short time. He served as a captain in the Mexican War, and later was a member of the Ohio Legislature. During the Civil War he was colonel of the 10th Ohio regiment and was brigadier-general of volunteers, having been promoted to that rank for gallant conduct. He was killed at the battle of Chickamauga. His best-known poem is the famous 'Address of Antony to Cleopatra,' the opening line of which is 'I am dying, Egypt, dying.' Consult 'Poems' with 'Memoir' by Venable (1884). No complete collection of his works was published.

Lytton, lit'ôn, Edward Robert Bulwer-Lytton, EARL OF, English poet and diploma-

LYTTON

tist: b. London 8 Nov. 1831; d. Paris 29 Nov. 1891. He was the only son of the well-known novelist, Bulwer-Lytton (q.v.). He was educated at Harrow and Bonn, and entered the diplomatic service in 1849, being appointed attaché at Washington, where his uncle, Lord Dalling, was minister. Subsequently he held diplomatic posts at Florence (1852) and other European capitals, and was secretary of legation successively at Copenhagen, Athens, Lisbon, and Madrid. In 1874 he was appointed minister at Lisbon, and was made viceroy of India by Disraeli in 1876. At a great durbar held at Delhi in 1877, he proclaimed Queen Victoria Empress of India. In the great famine of 1877-8 he conducted admirably the work of relief. He adopted an active policy in Afghanistan, which brought about the second Afghan war (1879). His administration was marked by notable internal reforms, such as the abolition of the inland customs, the repeal of duties on cottons, and the promulgation of new civil service rules. In 1880 he was created Earl of Lytton, and when the Conservative government retired in that year he sent in his

resignation as viceroy. In 1887 he was appointed British ambassador at Paris. For many years Lytton was better known as a poet than as a diplomatist, under the pseudonym of "Owen Meredith." His published works include: 'Clytemnestra, and Other Poems' (1855); 'The Wanderers' (1859); 'Lucile' (1860), a story in rimed anapæstic couplets, which met with a very great popular success; 'The Ring of Amasis' (1863); 'Orval, or the Fool of Time,' which is the solitary representative in English of the great Polish school of mystic verse (1860); 'Fables, in Song' (1874); 'Speeches of Edward Lord Lytton,' with a memoir (1874); 'The Life and Letters of Edward Bulwer, Lord Lytton' (1883, the narrative comes down only to 1832); 'Glenaveril' (1885); 'After Paradise' (1887); 'King Poppy,' his best poetical work, abounding in lofty poetry and gay irony, appeared posthumously (1892). As a prose writer Lytton takes high rank.

Lytton, Lord. See BULWER-LYTTON, EDWARD.

M

M the thirteenth letter of the English and most of the other West European languages, is one of the four liquids, or semi-vowels; it is also classed as a labio-nasal, its sound being produced when with lips closed and the whole uvula lowered, the breath makes a humming noise as it issues through the nostrils. The lips play the same part in the pronunciation of *m* as in that of *b*, but in pronouncing *b* the nasal passage has no part. Hence when that passage is obstructed or closed the sound produced is that of *b* not of *m*.

The *M* as a capital letter has the same form in the Greek and the Latin alphabets and in all the alphabets derived from them, and in all those alphabets generally the same sound value.

In English there are a few words of Greek origin, mostly technical, in which *mn* begins a syllable or a word: in such cases the *m* is silent, for example, mnemonic, nemonic.

In many words derived from other languages the *m* of the original word is changed to *n* in English, examples: Comitatus (Lat.) county, or contrariwise *n* is changed to *m*; Anglo-Saxon *henep* becomes *hemp*. Often *p* is added after *m* to give that letter greater distinctness, for example, *exemtus*, *exemptus*, *unkemmed*, *unkempt*.

M. Quad. See LEWIS, CHARLES BERTRAND.

Maartens, Maarten, mār'tēn mār-tēnz, pseudonym of the Dutch author, J. M. W. VAN DER POOKTEN SCHWARTZ; b. Amsterdam 15 Aug. 1858. He passed his early life in England; was educated in Germany and at the University of Utrecht, was admitted a barrister, but chose literature as a profession, and in 1890 published his first work, 'The Sin of Joost Avelingh,' which at once arrested the attention alike of critics and of reading public. This, like all his volumes, was written at first hand in English, not, as has been sometimes supposed, translated from Dutch MS. Maartens thus presents the curious instance of an author electing to address wholly a foreign public. Indeed, only with reluctance, to safeguard himself against unsatisfactory translations, did he consent to the publication of his books in Dutch. His further works are: 'An Old Maid's Love' (1891); 'A Question of Taste' (1891); 'God's Fool' (1892); 'The Greater Glory' (1894); and 'My Lady Nobody' (1895); 'My Poor Relations' (1905). In America 'The Greater Glory' first appeared, serially in 'The Outlook.' 'God's Fool' is perhaps Maartens' best, but 'The Sin of Joost Avelingh' and 'The Greater Glory' have had the greatest popular success. These books afford a by no means flattering picture of the Dutch bourgeoisie, but are admittedly accurate.

Maasin, mā-ā'sin. Philipines, (1) a pueblo of the province of Leyte, island of Visayas,

situated on the extreme southwestern coast, 75 miles southwest of Tacloban. It is a handsome, well-built city, and has a large trade, mostly in hemp. Pop. 18,500; (2) a town of the province of Iloilo, Panay, on a tributary of the Sague branch of the Jalaur River, 18 miles northwest of Iloilo. Pop. 9,700.

Maastricht. See MAESTRICHT.

Maat, or Mat, in ancient Egypt, the goddess of truth and justice. She is said to have guided the souls of the dead to Osiris (q.v.).

Mab, the fairy queen of Connaught and a familiar name in Celtic folk-lore. Mab has been celebrated by Shakespeare and other English poets. The name is of uncertain origin, being variously derived from the Midgard of the Eddas, the Habundia or Dame Abonde of Norman fairy lore, and from the Cymric *mab*, a child. According to Voss, Mab was not the fairy queen, the same as Titania, this dignity having been ascribed to her only by mistaking the use of the old English word *queen*, which originally meant only a woman. Queen Mab is mentioned in Shakespeare's 'Romeo and Juliet,' Ben Jonson's 'Satyr,' Randolph's pastoral of 'Amyntas,' Drayton's 'Nymphidia,' and Milton's 'L'Allegro.'

Mabalacat, mā-bā-lā'kāt, a pueblo of the province of Pampanga, Luzon, 16 miles north of Bacolor, the provincial capital. It is on the main road, and on the Manila and Dagupan railroad. Pop. 10,600.

Ma'bery, mā'bēr-i, Charles Frederic, American chemist; b. North Gorham, Maine, 13 Jan. 1850. He was graduated at the Lawrence Scientific School, Harvard, in 1876, and was assistant instructor in chemistry there from 1875 to 1883, since when he has been professor of chemistry in the Case School of Applied Science of Cleveland, Ohio. In the investigation of the composition of American petroleum his work has brought him into special prominence. He has also done valuable work in connection with the production of aluminum by means of electricity. The results of his original investigations at Harvard were largely published by him in papers appearing in the 'American Chemical Journal.'

Mabie, Hamilton Wright, American editor and author; b. Cold Spring, N. Y., 13 Dec. 1845. He was graduated from Williams College in 1867, from the Columbia Law School in 1869, practised law in New York in 1866-79, in 1879 became connected with the 'Christian Union' (now 'The Outlook'), and in 1884 formally entered its editorial staff. He became known as a contributor of essays to periodicals, and as an occasional speaker and lecturer on educational and literary subjects. Among his public ad

dresses was that at the dedication of the Zolnay bust of Poe in the University of Virginia. He also became president of the New York Kindergarten Association. His works are: 'Norse Stories Retold from the Eddas' (1882); 'Nature in New England' (1890); 'My Study Fire' (1st series, 1890; 2d, 1894; 3d, 1899); 'Under the Trees and Elsewhere' (1891); 'Short Studies in Literature' (1891); 'Essays in Literary Interpretation' (1892); 'Nature and Culture' (1897); 'Books and Culture' (1897); 'Work and Culture' (1898); 'In the Forest of Arden' (1898); 'The Life of the Spirit' (1899); 'Shakespeare: Poet, Dramatist and Man' (1900); 'Works and Days' (1902); 'Parables of Life' (1902).

Mabillon, Jean, zhōn mā-bē-yōn, French ecclesiastic and author: b. St. Pierre du Mont, Champagne, 23 Nov. 1632; d. Paris 27 Dec. 1707. Having joined the Benedictines of Saint Maur, he was chosen to assist Dom Jean d'Achery in the compilation of his 'Spicilegium Vetus Scripturum,' and subsequently edited the works of St. Bernard (1690) in the series of the fathers published by his congregation. In 1683 he was sent to Germany by Louis XIV. to collect documents relating to French history; and the applause with which his 'Iter Germanicum,' a narrative of the journey, was received, induced the king to send him to Italy in 1685 to make purchases for the royal library. A result of this tour was his 'Museum Italicum' (1687-9), a work of great value. Later he was selected by his superiors to refute Rancé, abbot of La Trappe, who had condemned the custom of permitting monks to study. His 'Essay on Monastic Studies,' which appeared in consequence in 1691, was equally remarkable for sound argument and good temper. His most important other works are: 'Vetera Analecta' (1675-85); 'De Re Diplomatica' (1681); and 'De Liturgia Gallicana' (1685). He edited and published with Ruinart 'Acta Sanctorum Ordinis Sancti Benedicti,' and published the first four volumes of the 'Annales Ordinis Benedictini' (1703-39). A collection of his 'Ouvrages posthumes' appeared in 1724, and his 'Inedited Correspondence with Montfaucon, Magliabecchi, etc.,' was edited by Valery (1847).

Mabini, mā-bē-nē, Apollinario, Filipino insurgent: d. Philippine Islands 1903. He was educated in the Catholic College of Manila, entered the public service under Spanish rule, became advocate of the treasury, resigned in 1896, and entered the insurrection. He became privy councillor of Aguinaldo, and for a time was minister of foreign affairs and chief of the supreme court in the latter's so-called government. In 1899 he surrendered to the United States, was sent into exile, but allowed to return in 1903. He was the brains of the Malolos government while it lasted.

Mabinogion, māb-i-nō-gĩ ōn, The, the name generally but incorrectly applied to all mediæval Welsh stories. Of the general title 'Mabinogion,' which Lady Charlotte Guest's English version (1838-49) has made familiar, John Rhys gives an explanation. "An idea prevails," says Principal Rhys, "that any Welsh tale of respectable antiquity may be called a mabinogi; but there is no warrant for extending the use of the term. . . . For, strictly speaking, the word mabinog is a technical term belonging to the

bardic system, and it means a literary apprenticeship. In other words, a mabinog was a young man who had not yet acquired the art of making verse, but who received instruction from a qualified bard. The inference is that the 'Mabinogion' meant the collection of things which formed the mabinog's literary training—his stock in trade, so to speak; for he was probably allowed to relate the tales forming the 'four branches of the Mabinogion' at a fixed price established by law or custom. If he aspired to a place in the hierarchy of letters, he must acquire the poetic art." In Lady Charlotte Guest's later edition in one volume (1877),—the most convenient edition for reference,—12 tales in all will be found. Of these, the most natively and characteristically Welsh in character are such tales as the vivid, thrice romantic 'Dream of Rhonabwy,' which owes little to outside sources. 'The Lady of the Fountain,' on the other hand, shows in a very striking way the influence of the French chivalric romances that Sir Thomas Malory drew upon so freely in his 'Morte d'Arthur.' In the admirably edited Oxford text of the Welsh originals by Rhys and Evans' (1887-90), 'The Lady of the Fountain' appears under the title of 'Owain and Lunet'; and Lunet's name at once recalls Tennyson's 'Idylls of the King.' The old manuscript volume of the 'Mabinogion,' known as the 'Llyfr Coch o Hergest,'—the 'Red Book of Hergest,'—is in the famous library of Jesus College, Oxford, the one college in the older English universities which has a time-honored connection with Welsh scholarship and Welsh literature.

Mably, Gabriel Bonnot de, gā-brē-ēl bōn-ō dē mā-blē, French ecclesiastic and publicist: b. Grenoble 14 March 1709; d. Paris 23 April 1785. His family name was Bonnot. Like his younger brother, the philosopher Condillac (q.v.), he was destined for the Church, and after studying at the seminary of Saint Sulpice in Paris was ordained subdeacon. He showed little liking for theology, and for some time was secretly employed in affairs of state by his relative Cardinal de Tencin, minister of Louis XV., conducting the most difficult negotiations and writing elaborate reports with an ability for which the minister received all the credit. Later he applied himself to literature, and in 1748 published his 'Droit publique de l'Europe,' which achieved a remarkable success. It was followed by 'Observations sur les Grecs' (1749); 'Observations sur les Romains' (1751); 'Entretiens de Phocion' (1753); 'Observations sur l'Histoire de France' (1755); 'Principes des Négociations' (1757); 'De la Manière d'écrire l'Histoire' (1773); 'De la Législation' (1776); 'De l'Idée de l'Histoire' (1778); and 'Principes de Morale' (1784). Having been requested by the government of Poland to prepare for them a code of laws, he visited that country in 1771, and published in 1781 a work 'Du Gouvernement de la Pologne.' He was also consulted by the American congress in 1783 on the preparation of the Constitution, and embodied his views in his 'Observations sur le Gouvernement et les Lois des Etats Unis d'Amerique' (1784). In this work he foretold the speedy downfall of the United States. Consult: Guervier, 'L'Abbé Mably, Moraliste et Politique' (1886).

Mabuchi, mā-boo'chē, Japanese writer and religious teacher: b. 1693; d. 1769. He was dis-

tinguished as a scholar, and utilized his great learning in the endeavor to purify the native religion, Shinto, from the accretions of Chinese and Buddhist philosophy, etc., whereby he regarded it as having been corrupted. His love and knowledge of antiquity enabled him to present the native faith in its original simplicity, and his teachings were exemplified in his own life. To him modern students are largely indebted for direct success to ancient Japanese poetry.

Mac, or **Mc**, a Gaelic prefix, as MacGregor, MacDonald, McKinley, etc. It corresponds with son in surnames of Teutonic origin, Fitz in those of Romance origin, or Ap or Ab in Welsh surnames.

Macabebe, mā-kā-bā'bā, Philippines, a pueblo of the province of Pampanga, Luzon, situated at the head of the Pampanga River delta, 9 miles from Manila Bay and 7 miles southeast of Bacolor. Pop. 10,400.

Macaber (mā-kā'bér) **Dance**. See DANCE OF DEATH.

Macadam, māk-ād'am, John Loudon, Scottish engineer: b. Ayr 21 Sept. 1756; d. Moffat, Dumfriesshire, 26 Nov. 1836. In 1770 he was sent to an uncle at New York, where he remained during the War of Independence, and realized a considerable fortune as agent for the sale of prizes. At the close of the War he returned to Scotland, and in 1798 was appointed agent for revictualing the navy in the western ports of Great Britain, and took up his residence at Falmouth. He afterward resided for many years at Bristol. It was here, in 1815, on being appointed surveyor-general of the Bristol roads, that he first had full scope for putting in practice the important improvements in road-making which had long before occupied his thoughts. By 1823 his general success was admitted; and in 1827 he was made general surveyor of roads. In carrying out his improvement he had expended several thousand pounds from his private resources; and the House of Commons, having been satisfied of the fact by the investigation of a committee, both reimbursed the actual outlay, and presented him with an honorary tribute of £2,000, presenting to him a total of £10,000. His invention was rapidly introduced throughout the civilized world, and his own name was made synonymous with it.

Macadam, a modern system of road-making invented by J. L. Macadam (q.v.), which consists in forming the roads out of hard materials such as granite, or basalt broken into pieces, none of which are too large to pass through an iron ring $2\frac{1}{2}$ inches in diameter, and then deposited evenly in a bed of from 6 to 12 inches in thickness. The bed thus laid becomes perfectly compact and smooth; and in proportion as it is worn away, or cut into ruts by traffic, can easily be restored by a new coating of materials. See ROADS AND ROAD-MAKING.

McAdoo, māk-a-doo', William Gibbs, American jurist: b. near Knoxville, Tenn., 4 April 1820; d. 1894. He was graduated in 1845 from the East Tennessee University at Knoxville, sat in the Tennessee Legislature 1845-6, and served in the Mexican War in 1847. He was afterward admitted to the bar and was attorney-general of the Knoxville judicial dis-

trict, 1851-60. He removed to Georgia in 1862, served in the Confederate army during the Civil War and in 1871 became judge of the 20th judicial district of Georgia. With H. C. White he published 'Elementary Geology of Tennessee.'

McAfee, mā-kā'fē, Robert Breckinridge, American historian: b. Mercer County, Ky., February 1784; d. there 12 March 1849. From 1833 to 1837 he was United States *chargé d'affaires* at Bogota, Colombia, and he was a member of the Royal Antiquarian Society of Denmark. He published 'History of the War of 1812' (1816), and much important information has been gleaned from his private journals relating to the early history of his native State.

McAlester, mā-kāl'ēs-tēr, Miles Daniel, American general: b. New York 1833; d. 1869. He was graduated from the United States Military Academy in 1856, and entering the engineer service became chief engineer of the department of the Ohio in 1862. In 1864 he was brevetted colonel and a year later brigadier-general.

MacAlester College, a coeducational institution in St. Paul, Minn.; founded in 1885 under the auspices of the Presbyterian Church. Its departments are academic, collegiate, and musical. It also conducts a summer school with brief courses connected with the three departments. The degrees granted are A.B. and Lit.B. In 1903 there were connected with the school 15 teachers and nearly 200 students. The library contained about 8,000 volumes, and the income from tuitions and other sources was about \$14,000.

McAll (mā-kāl') **Mission**, a Protestant association founded in 1871 by Robert Whitaker McAll (q.v.), and his wife, for religious work among the working people of France. On 17 Jan. 1872 the first station was opened in Belleville, one of the manufacturing suburbs of Paris. The work consists largely in striving to interest people in the questions pertaining to salvation of souls, and then urging them to affiliate with some one of the nearby Protestant churches. No effort is made by the Mission to establish churches, but some educational work has been begun in the large cities. Reports of the work for the year 1902 give in France 72 stations there the meetings are held in halls, and two mission boats. Friends of the movement in America, founded an American McAll Mission in 1883 with Philadelphia as headquarters. There are now in the United States about 65 auxiliary associations that collect and send to the French missions about one half of the whole amount of annual expenditures. The expense of the French work, in 1902, was \$68,302. Great Britain has 22 auxiliary associations and Canada 10. Friends in other countries contribute to the support of the missions.

McAllister, Samuel Ward, American society leader: b. Savannah, Ga., about 1830; d. 1895. He came of a family several of whose members were conspicuous at the bar. With his father, in 1850, he went to California, where he remained two years, and whence he removed to Newport, R. I., and afterward to New York city. Becoming possessed by marriage of a considerable fortune, he was able, by means of influential connections through his mother and wife, to enter into social life with the advantages of

personal qualification and family prestige. As a raconteur as well as an accomplished gourmet he had already attained prominence within a select circle when, by a well-turned remark, he became the leader of leaders in New York society, which, according to his strict limitation, included but 400 persons. The popular expression "The Four Hundred" originated from this assertion of McAllister's. He made contributions to the press, which, however, impaired rather than strengthened his unique position, as did also his volume 'Society as I have Found It' (1890).

McAllister, Fort. See **FORT McALLISTER.**

McAlpine, mā-kal'pīn, William Jarvis, American engineer: b. New York 1812; d. New Brighton, Staten Island, N. Y., 16 Feb. 1890. He took up engineering in 1827 under J. B. Jarvis, with whom he continued till 1839, and succeeded him as engineer of the Erie Canal enlargement. In 1851 he became State engineer of New York and State Railroad Commissioner 1855-7. He was subsequently engineer of several important railways, constructed the city waterworks at Albany and Chicago, and in 1870 his plans for improvement of the Cataracts of the Danube were accepted by the Austrian government. While engineer of the department of parks 1879-80, he constructed the Riverside Drive in New York.

Macao, mā-kow' or mā-kā'ō, China, a Portuguese settlement and seaport on the west shore of the mouth of the Canton River, 40 miles west of Hong-Kong. It occupies a high peninsula, formerly the island of Macao, but now united by a narrow isthmus north of the town with the island of Hiang-shan. The settlement is about eight miles in circuit; and its limits landward are defined by a barrier wall stretching across the isthmus, where a guard of Chinese troops is stationed to prevent foreigners from trespassing on the Inner Land. The town occupies a slope gradually descending to the sea, backed by a range of lofty hills, and having an extensive plain stretching east. It is nearly surrounded with water, and is open to the sea-breezes on every side. The houses occupied by the foreign population are large, roomy, and open; and the shops are numerous. The quay or "Praya Grande" is commodious, forms a pleasant drive, and is protected by a battery. The harbor is formed between the peninsula on which the town stands and the large island of Twee-lien-shan, to the west. Macao is considered the healthiest residence in southeast Asia. Near it, in a beautiful garden, is the grotto in which the poet Camoens is said to have finished the 'Lusiad.' The principal exports are tea, cassia and cassia oil, anise and anise oil, and opium. The commerce, which is chiefly carried on with Hong-Kong, Canton, Batavia, and Goa, has greatly declined since the opening of the rival free ports, and a considerable part of the colonial revenue, which amounts to about \$375,000, is drawn from a tax on the gambling tables for which Macao is notorious. The Portuguese first obtained permission to form a settlement and to trade at Macao in 1557. From 1563 they were required to pay a yearly tribute to the Chinese government, and their trading privileges were much restricted till 1844, when they were allowed to carry on commerce with the five ports then open to foreigners. Ma-

cao was then declared a free port, but the Chinese continue to ignore the territorial claims of the Portuguese. Pop. (1896) 78,627, inclusive of 74,568 Chinese, 3,898 Portuguese and 116 foreigners.

Macaque, mā-kāk', one of the small, short-tailed Asiatic monkeys of the genus *Macacus* and family *Cercopithecidae*, which are so docile, intelligent and interesting as a rule that they are common in menageries and frequently kept as pets; their gentleness and playfulness disappears as they grow old, however, and they are then likely to become morose and savage. They go about in troops, keeping by themselves, and differing from other monkeys in most of their actions and cries. Some of the best known are the quaintly crested capuchin, or bonnet-monkey (*M. sinicus*), excessively common and pestiferous in southern India; the entellus monkey (q.v.) of northern India; the large pig-tailed (*M. leoninus*) of Japan, whose likeness is seen in numberless Japanese drawings and carvings. Ranging over so wide a variety of countries their habits and food differ greatly. Besides the fruit, juicy leaves and insects eaten by most monkeys they devour small reptiles, young birds, frogs, and crabs, the last-named forming the principal diet of a Malayan species (*M. cynomolgus*). One species is isolated in the mountains of Algeria and Morocco, whence they were long ago carried, no doubt, to the island of Gibraltar, where they are known to the English of the garrison as "Barbary apes" (*M. inuus*), and the small band upon the Rock are carefully protected from harm.

Macaroni (Ital. maccheroni), a peculiar paste or dough prepared from wheat flour and manufactured into tubes or ribbons. It is an Italian invention, and, though made by a simple process, has never been produced with so great success in any other country. The grain grown in the more southern countries of Europe is said to possess a greater amount of gluten, and is therefore better adapted to this manufacture. The wheat, after being washed, is freed from the husks and ground in water mills, when hot water is added till it is of the consistency of stiff dough. Five different qualities of flour are obtained by an equal number of siftings, the last giving the finest and most delicate that can be made. To reduce the dough to tubes or ribbons, a hollow cylindrical cast iron vessel is used, having the bottom perforated with holes or slits. When this is filled with the paste, a heavy iron plate is driven in by a powerful press, which forces the paste through the holes, and gives it the shape of the perforations, the workman cutting off the pieces of the desired length as they come through. During this process it is partially baked by a fire made under the cylinder. Sometimes the flat pieces are formed into tubes by uniting the edges before they are thoroughly dry. After being hung up for a few days they are ready for use. The largest tubes are called *maccheroni*, the smaller *vermicelli*, and the smallest *fedelini*. Macaroni is prepared for the table by boiling and baking with grated cheese, and is in common with vermicelli and the other varieties much used in the preparation of soups. Since about 1880 the use of macaroni in the United States has largely increased, and where it was once only consumed by Italians in this country, it is now eaten by all classes. Numer-

ous macaroni factories have been established in New York and elsewhere. The United States imports annually from Italy over 500,000 boxes of macaroni.

Macaronic Verse, a kind of facetious poetry in which foreign words are jumbled together; so called by Teofilo Folengo, a Mantuan monk of noble family, who published a book entitled 'Liber Macaronicorum,' a poetical rhapsody, made up of words of different languages. His principal poem was called macaronic, because it was mixed up of Latin and Italian, as macaroni is mixed up with cheese. Consult Morgan, 'Macaronic Poetry' (1872).

MacArthur, Arthur, American general: b. Massachusetts 1 June 1845. Having enlisted in the United States volunteer service in Wisconsin he served through the Civil War period, being promoted lieutenant-colonel and brevet-colonel in May 1865, for gallant and meritorious conduct in the battles of Perryville, Ky., Stone River, Tenn., Mission Ridge and Danridge, Ga., Franklin, Tenn., and in the Atlantic campaign. He was mustered out of the volunteer service in June 1865, and entered the regular army with the rank of lieutenant in the 17th United States infantry the following year. In the Spanish-American War he was appointed a brigadier-general of volunteers, and assigned to the Philippine expeditionary forces. He was promoted brigadier-general in the regular army, 2 Jan. 1900; commander of the Military Division of the Philippines and promoted major-general U. S. A., 1901. He returned to the United States in 1901, and in 1902 had command of the land forces in the combined military and naval maneuvers along the Atlantic coast.

MacArthur, Duncan, American pioneer: b. Dutchess County, N. Y., 14 June 1772; d. Ohio 1839. His family removed in 1780 to the western frontier of Pennsylvania, where he was early inured to the labors and privations of border life. At 18 years he went to seek his fortune in the wilderness, and participated as a ranger or scout in the warfare with the Indians in Kentucky and Ohio, until the victory of Gen. Wayne in 1797 gave peace to the western country. About the commencement of the present century he settled in Ohio as a surveyor, and in 1805 became a member of the Ohio legislature, and was appointed major-general of the territorial militia. In the War of 1812 he received the commission of brigadier-general in the army, and succeeded General Harrison in 1814 in command of the army of the West. After the peace, as a joint commissioner with Gen. Cass, he negotiated the treaty with the Indians of Ohio for the sale of their lands in that State, which was ratified in 1818. He served again in the Ohio legislature 1815-21, and in 1823-5 was a representative in congress from that State. In 1830 he was elected governor of Ohio, which position he occupied until 1832.

McArthur, Robert Stuart, American Baptist clergyman: b. Dalesville, Quebec, 31 July 1841. He was graduated from the University of Rochester, N. Y., in 1867, and from the Rochester Theological Seminary there in 1870, and since May of the last named year has been pastor of Calvary Baptist Church, New York. He was for a long period connected editorially with the 'Christian Inquirer' and 'Baptist Review,' has lectured on foreign travel, and published, among

many other works, 'Calvary Pulpit'; 'Current Questions for Thinking Men' (1898); 'Lectures on the Land and the Book'; 'Around the World' (1899); 'Old Testament Difficulties.'

Macaulay, ma-ká'li, Catharine Sawbridge, English historian: b. Wye, Kent, 2 April 1731; d. Binfield, Berkshire, 22 June 1791. In 1760 she was married to George Macaulay, a London physician. She was an ardent Republican, and a great admirer of Washington, with whom she corresponded, and whom she visited in 1785. She published a 'History of England from the Accession of James I. to the Revolution' (8 vols. 1763-71), once very popular, and eulogized by Pitt in the House of Commons, but now neglected.

Macaulay, James, Scottish novelist: b. Edinburgh 22 May 1817; d. there 20 June 1902. He was educated at the University of Edinburgh, and for 35 years was in the service of the Religious Tract Society as editor-in-chief. In 1851-7 he was joint editor of the 'Literary Gazette,' and in 1858 became editor of the 'Leisure Hour Sunday at Home.' 'The Boy's Own Paper' and 'The Girl's Own Paper' were founded by him. He was a voluminous writer, and among his published works the following may be mentioned: 'Across the Ferry; First Impressions of America and its People' (1871); 'Memory Helps in British History' (1873); 'All True: Records of Adventure' (1879); 'Luther Anecdotes' (1883); 'Gordon Anecdotes' (1885); 'Livingstone Anecdotes' (1886); 'Wonderful Stories of Daring, Peril and Adventure' (1887); and 'Victoria, Her Life and Reign' (1887).

Macaulay, Sir James Buchanan, Canadian jurist: b. Niagara, Ont., 3 Dec. 1793; d. Toronto 26 Nov. 1859. He was an ensign in the British army during the War of 1812, and subsequently studying law was admitted to the bar in 1812. In 1820 he was appointed a judge of the king's bench, from 1849 to 1856 he was chief justice of the court of common pleas, and just prior to his death became judge of the court of error and appeal. He was knighted in 1859.

Macaulay, Thomas Babington, English essayist, historian, and statesman: b. Rothley Temple, Leicestershire, 25 Oct. 1800; d. Holly Lodge, Kensington, 28 Dec. 1859.

Macaulay was the son of Zachary Macaulay, a Scotchman of remarkable character, who achieved distinction by his life-long advocacy of the abolition of slavery and his efficiency, as a young man, in the governorship of Sierra Leone, the colony of African freedmen. The family removed to Clapham, then a suburb of London, where much of Macaulay's youth was spent. Hannah More was a friend of the family, encouraged the lad as a writer and presented him with books to start his library. Young Macaulay was regarded as a prodigy, and his memory was something startling. He attended school near Cambridge under a Mr. Preston; his range of reading, particularly in poetry and fiction, was immense, while his taste for mathematics and the exact sciences steadily declined. In October 1818, he entered Trinity College, Cambridge, and in the citadel of mathematics his distaste for this study became pronounced. Twice he gained the Chancellor's medal for poetry, and he displayed classical attainments, but was "gulphed" in mathematics.

However, after a third trial, he won a Fellowship in 1824. His mental training was thus one-sided; and a certain lack of philosophical grasp and a dislike of facing abstruse intellectual problems became characteristic.

The association with his college mates, rather than his studies, left the deepest impression upon Macaulay. His great friend was Charles Austin, whose influence converted the young Tory into an uncompromising Whig. He shone in the Union Debating Society, developing powers that afterwards became conspicuous in the House of Commons. Politics he had heard discussed from early childhood in the circles which gathered round his father's table, and along with literature politics was his abiding passion. At college he had competed for a prize in history on the subject that attracted him years later: "The Conduct and Character of William III."

Before leaving the University he began writing for publication in *Knight's Quarterly Magazine*. Two lyrics, 'Ivry' and 'Naseby' still live; but the most important contribution was the ingenious 'Conversation between Mr. Abraham Cowley and Mr. John Milton, touching the great Civil War.' It seems likely enough that the freshness and delicacy of this early work became injured by the author's entrance into the rougher world of political strife. On the other hand it may be maintained that Macaulay's gifts were preëminently those of the man in public life, and to him literature, always a delight, was nevertheless really but an avocation.

Macaulay's father unexpectedly became financially involved. Full of courage, the son began tutoring while still at Cambridge and cheerfully assisted in supporting his sisters. Ultimately, together with his brother, he paid off all his father's obligations.

Macaulay was called to the bar in 1828 for the Northern circuit; but soon gave up the law for politics. Interestingly enough, his entrance into politics came by way of literature. In August 1825, appeared the essay on 'Milton,' the first of the series that Macaulay contributed to the *Edinburgh Review*, which, for the next 20 years, made both him and the *Review* famous. Jeffrey, the editor, expressed his frank wonder as to where Macaulay "picked up that style." Upon Jeffrey's resignation Macaulay was offered the editorship, but he was not willing to leave London. Papers on 'Machiavelli' (1827), 'Dryden,' 'History' and 'Hallam's Constitutional History' (1828), followed, and soon after controversial articles on James Mill, Sadler and Southey, which revealed the declared Whig. Their reputation introduced him into both social and political life. He was made Commissioner of Bankruptcy in 1828, and in 1830, Lord Lansdowne, hearing of the attack on Mill, offered Macaulay a seat in Parliament for Calne in Wiltshire.

The time of entrance into the House of Commons was propitious. It was just before the death of George IV. and the accession of William IV., and consequently on the eve of the battle for the reforms of 1832. Macaulay was 30 years of age, was widely read in history and literature, and was a ready and fluent speaker aflame with interest in public questions. In 1824 he had made a notable speech at a meet-

ing of the Anti-Slavery Society; later, in the discussion for Catholic Emancipation, he headed a coachload of M.A.'s from London to Cambridge, arriving in time to vote down a petition in the University Senate against the Act. He now threw himself ardently into the struggle for the Reforms and took an honorable part in the fight from beginning to end. His parliamentary success was immediate. "Whenever he rose to speak," Mr. Gladstone testified, "it was a summons like a trumpet-call to fill the benches." His earliest effort was on the removal of the civil disabilities of the Jews, followed by an essay on the subject in the *Edinburgh Review* (January 1831). On the Emancipation of Slaves in the Colonies he never wavered, but stood unflinchingly true to his father's principles. He offered to resign his position with the ministry rather than yield his views on this subject; but the question was satisfactorily settled and his resignation not accepted.

Meanwhile he found time to write. The essays on 'Byron,' 'Johnson,' and 'Hampden,' appeared in 1831; 'Burleigh' and 'Mirabeau,' in 1832; 'War of the Succession in Spain' and 'Horace Walpole,' in 1833, and the first essay on 'Chatham,' January 1834.

As Secretary of the Board of Control Macaulay had interested himself in East Indian affairs, and in 1833, when the charter of the East India Company was renewed, he was offered a position on the East Indian Council with a salary of £10,000 per annum for five years. His brilliant career in Parliament was seemingly permanently endangered; but Macaulay did not hesitate. He could save half his salary and in five years have a competence. He needed money on account of the poverty of his father, for the sake of his two sisters, as well as for his own career; and he accepted, going out in 1834 and returning in 1838. The genius for government which the father had displayed at Sierre Leone, the son now manifested at Calcutta. His important permanent reforms were the creation of the Indian Penal Code and the Code for Criminal Procedure, achieved in the face of bitter local opposition, and the organization of a sound educational system.

Macaulay's family ties were very strong. A sister, Jane, had died in 1830, and his mother in 1831. One of his favorite sisters, Margaret, was married in 1832, an occurrence which he accepted as a source of personal distress. The other, Hannah, accompanied him to India, and there she met and was shortly married to Charles Trevelyan, an officer in the government service. Macaulay was much pleased with the match and the two households lived together under the same roof. Ever afterwards, as the young Trevelyan, his nieces and nephews, grew up, they became a very real part of Macaulay's life. His love for children, and particularly for these, was a marked trait, and one of them afterwards filially wrote his uncle's biography. Meanwhile his sister Margaret had died in England, and likewise his father died while Macaulay and the Trevelyan were on their homeward voyage. These deaths affected him deeply, and the home-coming was a sad one.

While in India he made opportunity for an

immense amount of reading, particularly of the Latin and Greek classics, to which he returned with increasing delight. He also read widely in Italian and French, and did some German on the return voyage. His love for the great poets, dramatists, orators, and historians, affected his culture, his style, and his ideals. The lists of his reading from now to the end of his life become a part of his biography and would stock a good library. His long walks with a copy of Homer or Virgil, from which he was reading or spouting, became an accustomed sight. Thenceforward he determined himself to write a History in emulation of Thucydides and Tacitus and Livy, and his set speeches caught something of the spirit of Lysias and Cicero.

Upon his return to England he left for a tour in Italy, revelling in its beauties and associations with the enthusiasm of a first visit and the eye of an historian and student of Latin and Italian literatures. The literary fruits were the 'Lays of Ancient Rome.'

Returned home he sincerely hoped to begin his 'History of England,' which he planned to write from the Revolution of 1688 to the death of George III. Had he begun it immediately, with 20 years of life to devote to it, he might easily have left ten and more volumes covering the century instead of the first five extending through but 15 years—a brilliant fragment. But he was again dragged into politics, and Macvey Napier, editor of the *Edinburgh Review*, made heavy draughts upon his time.

In India he had contributed but two essays to the *Review*, that on 'Mackintosh's History' and the very long one on 'Bacon.' However, his experience furnished him the material for the brilliant narratives on 'Clive' (1840) and 'Warren Hastings' (1841). Besides these, in the six years after his return, he contributed 'Sir William Temple' (1838)—written in an entirely fresh spirit—'Gladstone on Church and State' (1839), 'Von Ranke's History of the Popes' (1840), the 'Comic Dramatists of the Restoration' and 'Lord Holland' (1841), 'Frederick the Great' (1842), 'Mme. d'Arblay' and 'Addison' (1843), 'Barère' and the second essay on the 'Earl of Chatham' (1844). This, perhaps his noblest essay, proved to be his last. He was forced to give up writing in order to find time for his 'History.' His kindheartedness in yielding undoubtedly worked a detriment. But the entrance into politics was only in part due to the exigencies of his friends; for public life exercised a subtle fascination over him.

In 1839 he was elected member of Parliament for Edinburgh and was made Secretary at War with a seat in the Cabinet. Fortunately the ministry soon expired and his freedom from official duties gave him some leisure. He retained, however, his seat for Edinburgh, and his most important work was the Copyright Bill, which, after many radical suggestions, passed in almost the exact terms in which he advocated it.

In 1842 the 'Lays' appeared and achieved a great success despite the natural fears of friends. 'Christopher North' of *Blackwood's*, who had attacked Macaulay on account of the Southey reviews, made up—on poetry they could agree. In 1843 the 'Essays' were collected and published. There had been a constantly growing demand for them which their author at first

resisted. They had been written at odd moments of leisure and he regarded them as ephemeral, but copies were being introduced from America, and Macaulay had to consent. The sale proved their popularity was a permanent one. Macaulay's Essays still are unapproached of their kind, as condensed booklets of knowledge. An analysis of their contents shows how their author's mind was revolving constantly upon a definite period of English history—the Revolution and the consequent development under constitutional government, the subject he set for himself in writing his 'History'—and these are uniformly among his best. Those on foreign subjects and the controversial ones are less satisfying.

The 'History' had been delayed year after year for lack of leisure to begin actual work. At length the first two volumes appeared in 1848. They comprised the reign of James II. and the Revolution; but reproduced the setting as a whole and included details at once picturesque and dramatic as could only be drawn by a supreme master of narrative. Macaulay had set for himself high ideals; he wished to be read and to be understood; he sought to give a series of brilliant mental pictures; and he achieved what he set out to do. He is weakest, perhaps, on the side of ethical interpretation, in searching out the causes and setting forth the nexus of events; but his narrative is brilliant and effective. His faults are those of the man of culture in the world, as are his virtues—high-mindedness and a sense of personal honor and dignity. In opinions he represented the great middle class and the world of Whiggism and its mode of thinking; in many things, Philistine; in some things, even vulgar; where mysticism and all esoteric systems of philosophy and kindred schools of poetry were accounted as foolishness.

The popularity of the 'History' was something enormous, surpassing even that of Byron's poems and of Scott's and Dickens's novels. In 1849, in consequence of this success, Macaulay was made Rector of the University of Glasgow and Fellow of the Royal Society. He had been appointed Trustee of the British Museum in 1847. He declined a professorship of History at Cambridge, and steadily refused positions under the government which would take up his time.

He had represented Edinburgh in Parliament for eight years, when, in 1847, on account of his characteristic independence in voting for the Maynooth grant—for the maintenance of a Catholic university in Ireland—he offended many Edinburgh electors, and was not returned at the polls. He accepted his defeat with relief, and turned the more eagerly to the 'History.' In 1852 without any solicitation on his part, and with a steady refusal to give pledges, he was returned voluntarily by the electors of Edinburgh to his former seat. Under such circumstances he felt he could not refuse; but it aided in sapping his strength, and that year he had a spell of illness from which he never wholly recovered.

In 1853 his speeches were collected and published. In 1855 the third and fourth volumes of his 'History' appeared. Macaulay feared for their success after the splendid reception of the former two; but the new subject was the life

and career of William of Orange, his favorite hero, he had worked hard to sustain himself, and 26,500 copies were sold in ten weeks. In 1857 he was made a peer, and chose the title, Baron Macaulay of Rothley, from his birth-place. Likewise this year he was made a foreign member of the French Academy, member of the Prussian Order of Merit, and High Steward of Cambridge. In 1858 he wrote five short biographies for the eighth edition of the *Encyclopædia Britannica*—Atterbury, Bunyan, Goldsmith, Johnson, and Pitt. These show greater compactness and maturity in judgment than his earlier treatment of the same themes.

In 1856 he left his bachelor quarters in town, at The Albany, and leased a pleasant villa, Holly Lodge, Campden Hill, Kensington. In 1859 his brother-in-law, now Sir Charles Trevelyan, was appointed Governor of Madras, and the thought of the separation bore heavily upon him. Fortunately his sister and the children remained behind a while longer. Macaulay had not been well for some time, and he died at Holly Lodge, 28 December. On 9 Jan. 1860, he was buried in Westminster Abbey in the Poets' Corner at the foot of Addison's statue.

A fifth volume of the 'History,' concluding the reign of William III., had been completed, and was edited posthumously by Lady Trevelyan. In 1876 appeared Macaulay's 'Life and Letters' by his nephew, George Otto Trevelyan.

A critical short biography is that of Mr. J. Cotter Morison ('English Men of Letters').

J. B. HENNEMAN,

Professor of English in the University of the South.

McAuley, Catherine, Irish founder and first superior of the Sisters of Mercy: b. Stormont House, County Dublin, Ireland, 29 Sept. 1787; d. Dublin, 11 Nov. 1841. In childhood she was adopted by a wealthy Protestant family who allowed her to remain in the church of her father, the Roman Catholic, and left her a large fortune which she wished to use for the benefit of the poor. She first erected a commodious house wherein might be taught a number of poor children, and where homeless young women might find lodging and board. This institution was opened in Dublin, 24 Sept. 1827, but the religious order was not established until 12 Dec. 1831. The members of the order take the vows of poverty, chastity, and obedience; and the works which they perform are visiting the poor, sick, and imprisoned, teaching, establishing hospitals, orphanages, homes for the friendless and other works of mercy. There are houses of her order in nearly all parts of the world. In the United States it comprises about 6,000 members. The order includes a college for young women, at Mount Washington, Md., a large number of academies, high and elementary schools, and hospitals and orphanages in nearly every State in the Union. Consult: Hartnett, 'Mémorial of Mother McAuley'; Murphy, 'Sketches of Irish Nunneries'; Member of Order of Mercy, 'Life of Catherine McAuley.'

Maçayo, mā-sī-ō', Brazil. See **MACÉIO**.

Macbeth, or **Macbethad**, **MacFinlegh**, king of Scotland who reigned from 1040 to 1057. The facts of his life, so far as known, are these. During the reign of Duncan he was "mormaer" of Moray by inheritance, and by his marriage

with Gruoch, grand-daughter of Kenneth IV. Duncan, in his attempt to subdue the independent chiefs of the north, was slain by Macbeth at Bothgowan, supposed to be near Elgin. By this means Macbeth became king, and, according to accounts, his reign was fairly successful. He was finally defeated in battle and slain by the sons of Duncan at Lumphanan, Aberdeen (1057). The legends which gradually gathered round the name of Macbeth were collected by John of Fordun and Hector Boece, and reproduced by Holinshed in his 'Chronicle.' These writers appear to have overlooked the excellent qualities of Macbeth as king, and regarded him with horror as a usurper. Consult: Robertson, 'Scotland under her Early Kings' (1862); Skene, 'Celtic Scotland' (1876-80).

Macbeth, a tragedy by Shakespeare, written about 1605, and printed in the first folio edition of Shakespeare 1623. See preceding.

McBurney, māk-bēr-nī, **Charles**, American surgeon: b. Roxbury, Mass., 17 Feb. 1845. He was graduated at Harvard in 1866; and from the Columbia Medical School in 1870, and has since practised his profession in New York. He was professor of surgery in the College of Physicians and Surgeons, New York, and has been visiting and consulting surgeon at St. Luke's, the Presbyterian, Roosevelt, New York Orthopedic, and other hospitals. When President McKinley was shot, Dr. McBurney was summoned to Buffalo as consulting surgeon.

McBurney, Robert Raikes, American religious worker: b. Castleblaney, Ireland, 31 March 1837; d. Clifton Springs 27 Dec. 1898. He came to the United States in 1854, and from 1862 was the general secretary of the New York Young Men's Christian Association. He was devoted to his work, and with the progress of years came to be recognized as the leading Y. M. C. A. secretary in the world.

McCabe, ma-kāb', **Charles Cardwell**, American Methodist bishop: b. Athens, Ohio, 11 Oct. 1836; d. New York 19 Dec. 1906. He was educated at Ohio Wesleyan University. In 1860 he entered the Methodist Episcopal ministry, and in 1862 was appointed chaplain of the 122d Ohio Infantry. At the battle of Winchester he was captured, and held in Libby prison for four months, and soon after his release entered the service of the United States Christian Commission and succeeded in raising a large amount of money for its work. Later he became financial agent for Wesleyan University; and in 1884 was made secretary of the Methodist Episcopal Missionary Society. He was remarkably successful in raising large amounts of money for missionary purposes. He became a bishop of his Church in 1896, and in December 1902 was elected chancellor of the American University at Washington, D. C.

Maccabees, māk'a-bēz, two books of the Scriptures considered by the Roman Catholic Church as inspired, and therefore included in the canon. The Protestant bodies hold them to be of high historic value, but at the Reformation they were excluded from the canon as not to be considered a part of the inspired Word of God. They are, therefore, classed in the Apocrypha (q.v.). They were also excluded from the Jewish canon, as well as from that of the

Greek Church, and while the Church of England allows them to be read aloud in public worship, it declares in Article VI. these "books" . . . "the Church doth read for example of life and instruction of manners; but yet doth not apply them to establish any doctrine." The main objection made by Protestants to their canonicity seems to be that they favor prayers for the dead, as in the passage Macc. xii. 45.

The books of the Maccabees are of high interest, and record in a tone of lofty enthusiasm the heroic struggle of the Jewish people to maintain their independence against overwhelming odds. The political object of this struggle was ever of less importance to them than their religious object, namely, to vindicate the sanctity of the temple and the integrity of Jewish Levitical worship. The circumstances under which this struggle took place may be summarized as follows: When the whole East as far as the Punjab and the Indus had fallen subject to the arms of Alexander the Great, it is related that after conquering Syria in its northern and Phœnician territories, and taking Tyre and Sidon, he projected a southern campaign against the Jews, whose fertile territory and wealth had attracted his notice. Then, it is said, he saw a vision of the high priest Jaddua coming out to meet him on his march. He persisted, says Josephus, in continuing this expedition against Jerusalem, but when he approached the sacred city his vision came true, which so impressed him with superstitious awe that he made a treaty with the Jews, and turned back from his purpose of sacking the city of Zion, and wasting the country. In 323 Alexander died at Babylon and the Diadochi divided among themselves the area of his conquest. Syria fell to the lot of the Seleucidæ, one of whom, Antiochus Epiphanes, formed a design to extend his kingdom by the conquest of Palestine. On completing this design he showed himself as hostile to the Hebrew religion as he had been to their national independence.

The Hebrews might have tolerated the introduction of the Greek language into their homes and markets, or even of some Greek customs and laws. But when Antiochus proceeded to a high handed defiance of their religious beliefs and observances, they felt that the honor of God, the sacredness of the law, the sanctity of the temple, were to be vindicated. Their deep-seated and hereditary fanaticism was awakened and when they saw the image of Zeus set up in the holiest place, and the Jewish ritual abolished they entered upon that struggle which is related in the books of the Maccabees.

The date of that act of desecration by which pagan worship was instituted in the temple of Jehovah is the 25th of the month Chisleu (December) 168 B.C. Soon after this a champion of Jehovah arose in the village of Modin. A certain priest named Mattathias refused to sacrifice according to the Greek rite, and actually headed an insurrection against the officials of the government. A long series of patriotic wars ensued. The Syrian king found stubborn antagonists in the five sons of Mattathias, John, Simon, Judas, Eleazar and Jonathan, who were the generals of the Jewish armies. But although they are collectively styled Maccabees, the name is only proper to one, the greatest of them, Judas, who by his skill and intrepidity led on his countrymen from night attacks and sudden sur-

prises to more open and important operations; and at length defeated Apollonius and Seron, who had marched to the attack with greatly superior forces, at Bethhoron, in the plain of Esdraelon, the battle-field of Palestine and the scene of some of the most glorious victories in Jewish annals. Lysias, the lieutenant of Antiochus, headed an expedition against the patriots, but Judas encountered him, and defeated him with signal loss. Judas now occupied Jerusalem, purified the temple three years after its profanation, and re-inaugurated the holy service. The anniversary day of this re-inauguration was afterward called the "Feast of the Dedication," and kept with solemn observances (John x. 22). Despite his successes the position of Judas was anything but secure, and in 103 B.C. Lysias took Bethsura, and laid siege to Jerusalem. He had guaranteed to the Jews the liberty of their religion; but he was put to death by Demetrius, a new claimant of the crown, who sent Nicanor against Judas. The Jewish leader defeated him first in a battle at Capharsalama, and then with total ruin at Adasa, but feeling the difficulty of continuing the contest against the whole power of the Syrian empire, solicited an alliance with the Romans. A Syrian army again invaded Palestine, before aid could reach him from his new allies. To 22,000 Syrian troops, led by Bacchides, Judas could oppose only 3,000. Though these had gradually diminished to 800 he resolved to attack the invaders, and after a desperate struggle he fell fighting with useless valor, 161 B.C. Judas derived his name from *Makkava*, a hammer, for he dealt many heavy blows to Syrian paganism. So Charles Duke of Austria, son of Pepin d'Heristal, was styled Charles the Hammer (Martel) for his defeat of the Saracens between Tours and Poitiers. The Maccabees have always been looked upon as the national heroes of the Jews, and they are reckoned as saints on the calendar of the Greek Church, and venerated as such.

McCall, ma-kâl', George Archibald, American soldier: b. Philadelphia 16 March 1802; d. 25 Feb. 1868. He was graduated at West Point in 1822; in 1846 reached the rank of captain, and that of colonel in 1850. Having served against the Seminoles in Florida, he won distinction in the Mexican War; in 1850 he became inspector-general, resigning from the army three years later. In 1861 he was given command of the Pennsylvania Reserves, with the rank of brigadier-general of volunteers, and participated in the work of the Army of the Potomac, particularly in the Peninsular campaign of 1862, in which he was engaged with his troops at Mechanicsville, Games' Mill, and Frazier's Farm (qq.v.). At Frazier's Farm, 30 June, he was taken prisoner, and was confined for several weeks in Libby prison. In August he was exchanged, but impaired health prevented him from returning to the army, and in 1863 he re-

signed. He wrote 'Letters From the Frontier' (1868).

McCalla, Bowman Hendry, American naval officer: b. Camden, N. J., 19 June 1844. He was graduated at the United States Naval Academy in 1864, and rose by promotion through the ordinary grades to captain in 1898. In 1890 he was court-martialed on charges of cruelty to his subordinates and was suspended for three years, but in consideration of previous acts of gallantry was restored to active service in 1891. He commanded the Marblehead during the war with Spain in 1898 and was subsequently restored to the place he held on the list of officers previous to his suspension. In 1899 he commanded the Newark and aided in the pacification of the Philippines. In 1900 he cooperated with Vice-Admiral Seymour in putting a stop to the Boxer troubles at Peking. In 1901 he was given command of the Kearsarge; in 1905 became commandant of the Mare Island Navy Yard and was retired 19 June 1906.

McCammon, Joseph Kay, American lawyer: b. Philadelphia 13 Oct. 1845; d. 2 Jan. 1907. He graduated at Princeton in 1865; studied law; became register in bankruptcy in 1870; was special counsel of the United States in Washington, 1871; president of the board for investigation of the Indian service, 1877; assistant attorney-general of the United States, 1880-5; and in 1881 was appointed United States commissioner of railroads. Under Presidents Garfield and Arthur, he conducted treaties with various Indian tribes. Among his writings are a 'Report on Indian Service' (1878); 'Report of Councils with Bannock and Shoshone Indians' (1881); 'Report of Councils with Flathead and Other Indians' (1882); 'Arguments in Cases Affecting Pacific and Other Railroads.'

McCarthy, ma-kär'thi, Justin, Irish author and politician: b. Cork, Ireland, 22 Nov. 1830. He became connected with the Liverpool press in 1853 and in 1864 was made editor-in-chief of the *Morning Star*. Since 1879 he represented the Home-Rule party in Parliament. His stay in the United States extended from 1868 to 1870, during which period he was for some time connected editorially with the New York 'Independent.' His main work is 'History of Our Own Times' (1870-80); but he has also written: 'History of the Four Georges' (1889), and his novels include: 'Lady Judith' (1871); 'A Fair Saxon' (1873); 'Dear Lady Disdain' (1875); 'The Right Honorable' (1886 with Mrs. Campbell-Praed). Later he has published 'The Story of Gladstone's Life' (1897); 'Modern England' (1898); and 'Reminiscences' (1898). He enjoys a pension from the British government for his 'services to literature.'

McCarthy, Justin Huntley, Irish journalist and author: b. 1860. He was graduated at University College and in 1884 was elected to Parliament. He has been a prolific and versatile author, following in the footsteps of his father Justin McCarthy (q.v.). Among his works are 'Outline of Irish History' (1883); 'Serapion, and Other Poems' (1883); 'England Under Gladstone' (1884); 'Camiola, a Girl with a Fortune' (1885); 'History of the French Revolution' (1897); 'The Proud Prince' (1903); 'The Dryad' (1905). He has also written plays, such as 'The Candidate'; 'The White Carnation,' and 'If I Were King.'

McCaul, ma-käl', John, Canadian scholar: b. Dublin, Ireland, 1807. He was elected president of Toronto University in 1849 and was interested for many years in educational matters in Canada. He edited Horace, Longinus, Lucian and Thucydides as college text-books, and among his valuable archæological works are 'Britanno-Roman Inscriptions' (1863); and 'Christian Epitaphs of the First Six Centuries.'

MacCauley, ma käl'i, Clay, American Unitarian clergyman and author: b. Chambersburg, Pa., 8 May 1843. He was graduated at Princeton in 1864, and at the Theological Seminary of the Northwest, Chicago, in 1867, and read philosophy and divinity at Heidelberg, 1872. In the Civil War, 1862-3, he was a lieutenant in the 126th Pennsylvania regiment, and served on the staff of Gen. S. D. Sturgis, and in 1864-5 was a member of the Christian Commission in the United States army. In 1880-1 he was a collaborator of the Bureau of Ethnology among Indians east of the Mississippi. Entering the Unitarian ministry, he was pastor of the First Church, Waltham, Mass., 1869-72, and of All Souls Church, Washington, D. C., 1876-81. From 1890 to 1900 he served as director of the Japan mission of the Unitarian Association, and from 1891 to 1899 was president of the College for Advanced Learning at Tokyo and professor there of philosophic and historic theology. He has written: 'Christianity in History' (1891); 'The Religious Problem of Japan—How Solve It?' (1894); 'Introductory Course in Japanese' (1896); 'Japanese Literature' (1899); 'A Day in the Very Noble City, Manila' (1899); and has published 'Single Songs of a Hundred Poets' (1899) and other translations from the Japanese.

McCausland's Raid, an incursion of the Confederate general McCausland into Maryland and Pennsylvania, the chief incident of which was the burning of Chambersburg, Pa. Gen. Early having defeated Gen. Crook in the battle of Kernstown (q.v.), 24 July 1864, and driven him and Averell across the Potomac at Williamsport, ordered Gen. McCausland with his brigade and that of Bradley T. Johnson, with four guns, in all about 2,500 men, across the Potomac to raid Pennsylvania and then move to Cumberland, Md., to destroy the machinery of the Cumberland coal-pits and the repair-shops, stations, and bridges of the Baltimore & Ohio Railroad. Early says he wished to open the eyes of the people of the North to the enormities of its armies, by an example in the way of retaliation, and that Chambersburg, Pa., was selected as the town on which retaliation should be made. The sum of \$100,000 in gold, or \$500,000 in currency was to be demanded of it, in default of which McCausland was ordered to burn the town. Under cover of demonstrations at Williamsport and other points along the Potomac, McCausland crossed the river at McCoy's Ferry, near Clear Spring, above Williamsport, on the 29th, and made straight for Chambersburg, about 25 miles northeast. He met with but little opposition and, on the morning of the 30th, rode into the fated town and demanded the sum fixed by Early. It could not immediately be raised; he knew that Gen. Averell was close upon him; and setting fire to the place, laying a greater part of it in ashes, he hastily marched westward to Mc-

Connellsburg and encamped. Averell, who was in Hagerstown when he heard that McCausland had crossed the Potomac, started in pursuit with about 2,600 cavalry, went through the burning town and, a few miles from McConnellsburg, struck McCausland's rear, diverting him from his intended march on Bedford and forcing him back to the Potomac at Hancock, which was reached by noon of the 31st. Here McCausland formed for battle, but upon Averell's appearance and prompt attack he withdrew westward by the National road to Cumberland, where, 1 August, he found Gen. Kelley to oppose him, whom he attacked in the afternoon, and skirmished until night, when he retreated toward Old Town, on the Potomac, leaving 30 of his killed and wounded on the field. At Old Town he forced a crossing at daylight 2 August, capturing or dispersing a regiment of new troops from Ohio, and then moved south into the Valley of the South Branch of the Potomac, by way of Springfield and Romney. From Romney, 4 August, he moved on New Creek and attacked the garrison, but after a stubborn fight was repulsed, leaving 25 dead on the field, the Union loss being 36 killed and wounded. McCausland then withdrew to near Moorefield, where the South Fork joins the South Branch of the Potomac, and considering himself safe from pursuit, went into camp. Averell, who had remained at Hancock when McCausland drew off toward Cumberland, crossed the Potomac on the 4th, and, after a forced march through Bath, Springfield, and Romney, before sunrise of the 7th surprised McCausland in his camp and routed him, capturing his four guns, nearly all his wagons, several hundred horses, three battle-flags, many small arms, and 420 prisoners, including 38 officers. McCausland's loss in killed and wounded was about 100. Averell's loss was 41 killed and wounded. McCausland's shattered command fled to the mountains, and made its way in squads to the Shenandoah Valley, finally assembling at Mount Jackson. "This affair," says Early, "had a very damaging effect upon my cavalry for the rest of the campaign." Consult: 'Official Records,' Vols. XXXVII., XLIII.; Pond, 'The Shenandoah Valley in 1864'; Early, 'The Last Year of the War for Independence.'

E. A. CARMAN.

MacChesney, Clara T., American artist: b. Brownsville, Cal., 1861. She studied at the San Francisco Art School, at the Gotham Art School, New York, and at the Colarossi School in Paris. Her genre work has received favorable recognition. At the World's Columbian Exposition in 1893 she was awarded two medals and she received the Dodge prize, New York, in 1894. Since then she has also received three medals from the Colarossi School, a gold medal from the Philadelphia Art Club, and the second Hallgarten prize from the National Academy of Design, New York. At the Paris Exposition of 1900 she exhibited 'Pomegranates' and 'The Old Blind Fiddler.'

McChesney, Dora Greenwell, American author: b. Chicago 1 Oct. 1871. She was privately educated, chiefly by her mother, in whose company she traveled and read widely, making special acquaintance with German literature, Italian art, and Roman antiquities, also becoming deeply interested in studying the English civil war, with characters and incidents of which

her writings largely have to do. Among these are: 'Kathleen Clare, Her Book, 1637-1641' (1895); 'Miriam Cromwell, Royalist: a Romance of the Great Rebellion' (1897); 'Beatrice Infelix; a Summer Tragedy in Rome' (1898); 'Rupert, by the Grace of God: the Story of an Unrecorded Plot' (1899).

Macchiavelli, Niccolo. See MACHIAVELLI, NICCOLO.

McClellan, ma-klel'an, George Brinton, American soldier: b. Philadelphia 3 Dec. 1826; d. Orange, N. J., 29 Oct. 1885. He was educated at the University of Pennsylvania and at West Point where he was graduated in 1846. He was brevetted 2d lieutenant of engineers, and immediately ordered to Mexico, where as lieutenant of a company of sappers, miners, and pontoniers he rendered valuable service. He was at the siege of Vera Cruz, at Cerro Gordo, and in the attack on the City of Mexico; at Contreras and Churubusco he won the brevet of 1st lieutenant, and was brevetted captain for gallantry at Chapultepec. After the war he was ordered to West Point as captain of field labors and instructor in bayonet exercise. In 1851 he was ordered to Fort Delaware to superintend its construction. The next year he accompanied Capt. Randolph B. Marcy (later his father-in-law) on an expedition to explore the Red River, and in September 1852 was ordered as senior engineer to Texas, to survey the rivers and harbors of that State. In 1853 he was detailed for the examination of the western part of the proposed route for a Pacific railroad; and explored the Yakima pass and various portions of the Cascade range, and the most direct route to Puget Sound, his report forming the 1st volume of the 'Pacific Railroad Surveys' published by the government. He was soon afterward detailed to investigate the railroad system of the United States, with a view to obtain all the necessary data on construction, equipment, and management for the successful operation of the Pacific railroad. Of the result of his proceedings he presented a full report in November 1854. In March 1854 he was promoted to be captain in the 1st cavalry. In the spring of 1855 he was sent to Europe to study the organization of European armies, and observe the war in the Crimea. He wrote one volume of the report of this commission, which was republished in Philadelphia under the title of 'The Armies of Europe' (1861). He resigned his commission in January 1857, and was for three years vice-president and engineer of the Illinois Central Railroad, at the end of which time he became general superintendent of the Ohio and Mississippi Railroad, and two months later president of the eastern division of the same road. He held this office when the Civil War broke out in 1861. He then received a commission as major-general from the governor of Ohio and proceeded to organize the volunteers of the State; the States of Ohio, Illinois, Indiana, the western part of Pennsylvania and western part of Virginia were united to form the department of the Ohio under his command. About 1 June his army began to cross the Ohio River into Virginia; on the 18th McClellan himself left Cincinnati to take the field, and by the middle of July the whole northwestern part of the State had been cleared of Confederate troops and the Wheeling legislature left free to organize a loyal government.

McCLELLAN — McCLERNAND

On 22 July, McClellan was summoned to Washington to take command of the Army of the Potomac, and commissioned as major-general of the United States army. On his arrival at Washington, he found everything in disorder and the troops badly demoralized in consequence of the defeat at the first battle of Bull Run, and devoting himself to the organizing and disciplining of his army, he soon brought order out of chaos, and had his troops well equipped and in excellent condition. On the retirement of General Scott from active service, McClellan was appointed general-in-chief of the armies of the United States. Plans were then taken under discussion for an attack upon Richmond, and here difference of opinion arose between the President and the Secretary of War and McClellan; the plan finally accepted made the base of supplies on Chesapeake Bay, with line of march upon Richmond from the Peninsula. The army did not move until March 1862, and in the meantime discontent had arisen at Washington on account of the delay. On 10 March the army advanced toward Manassas, but as the Confederates had evacuated that place and had fallen back upon Richmond, the real campaign was begun by transporting the troops to Fortress Monroe. On 11 March, some two weeks before leaving Washington, McClellan was deprived of the chief command, leaving him the command of only the Army of the Potomac; McDowell's corps and other reinforcements on which he had relied were also removed from his army for the defense of Washington. He besieged Yorktown for a month, though opposed by a much inferior Confederate force, whose numbers he greatly overestimated; when Yorktown was evacuated 4 May, he advanced toward Richmond, defeating the Confederates at Williamsburg and Hanover Court House. After reaching the Chickahominy, he found his lines too extended to protect from attack and advance upon Richmond, and decided to retreat to the James River; then followed the Seven Days' Battles which ended when the Federal Forces reached Hampton's Ferry. From here McClellan had planned a new advance, but dissatisfaction against him was so strong that he was relieved from his command, and ordered to evacuate the peninsula. (See *PENINSULAR CAMPAIGN*.) He was then put in command of the fortifications of Washington, till after the second battle of Bull Run, when he succeeded General Pope, again taking command of the Army of the Potomac. On Lee's invasion of Maryland, McClellan marched to attack him, and fought the battle of Antietam (q.v.) forcing the Confederates to retreat from their position and following them as far as the Potomac. He did not, however, cross the Potomac in pursuit, as he was awaiting supplies; this failure to follow up his victory caused him to be deprived of his command, and he was ordered to Trenton, N. J. He took no further part in the war.

In 1864 he was Democratic nominee for President of the United States, and was defeated, the electoral vote stood 212 for Lincoln against 21 for McClellan, but McClellan's popular vote was 1,800,000. He remained abroad from 1864-8, and on his return had charge of the construction of the Stevens' floating battery, which, however, was not completed on account of financial difficulties. In 1870 he was appointed chief engineer of the department of

docks for New York city, in 1877 he was elected governor of New Jersey, and during his administration reduced and finally abolished the State tax, improved the system of public education, and built up an effective militia; he declined a renomination. As a general, McClellan won the confidence and aroused the enthusiasm of his soldiers to an unusual degree; he excelled as an organizer of armies, and had a thorough knowledge of the science of tactics, as shown in his plans of campaign, but in actual campaigning lacked aggressiveness and the power to act quickly and take advantage of his enemy's mistakes. He wrote besides the reports mentioned 'Manual of Bayonet Exercise' (1852) and 'Report on the Organization and Campaigns of the Army of the Potomac' (1864). Consult: 'McClellan's Own Story,' edited by W. C. Preine, and Michie, 'General McClellan' ('Great Commander' series).

McClellan, George Brinton, American politician: b. Dresden, Saxony, 23 Nov. 1865. He is the son of General G. B. McClellan (q.v.). He was graduated from Princeton in 1886; and took up journalism, working as a reporter and in editorial positions for several of the New York city dailies. He studied law, and was admitted to the bar in 1892. From 1889 to 1892 he was treasurer of Brooklyn Bridge. Early active in politics as a Democrat, he was elected to the board of aldermen, and was president of that board in 1893 and 1894. He was elected to Congress in 1894, and for four succeeding terms, and was a member of the House Committee of Ways and Means. In Congress he has been an advocate of tariff reform and free trade, and though opposed to an imperialistic policy, did not sympathize with the attacks on the conduct of the United States army in the Philippines. In 1903 he was nominated for Mayor of Greater New York by the regular Democratic organization (Tammany Hall), and was elected by 63,000 majority. In 1905 he was again elected Mayor by 3,472 plurality.

McClelland, Robert, American lawyer: b. Franklin County, Pa., 1807; d. Detroit, Mich., 30 Aug. 1880. He was graduated at Dickinson College, Pa., and subsequently practised law at Pittsburg, Pa., but in 1833 emigrated to Michigan, and entered into commercial business in Monroe. His political life was soon afterward begun, for in 1835 he was elected to the State legislature, and to Congress in 1843. He became governor of Michigan in 1852, and in 1868 was a member of the Democratic National Convention which nominated Seymour and Blair.

McClernand, ma-klér'nand, Edward John, American soldier: b. Jacksonville, Ill., 29 Dec. 1848. In 1870 he was graduated at West Point and stationed on the Western frontier for the nine following years, in which he did rescue work after the destruction of Custer's command, and had a share in the capture of Chief Joseph and the Nez Percés Indians. In 1898 he was appointed lieutenant-colonel and adjutant-general of volunteers, served with the Army of Santiago de Cuba in 1898, and was ordered to the Philippine Islands, where he routed the insurgents at Cebu, 8 Jan. 1900. He was subsequently put in command of the 2d district in the Department of the Visayas, including the is-

lands of Cebu, Mactan, Baulayan and the Camotes.

McClernand, John Alexander, American lawyer: b. Breckinridge County, Ky., 30 May 1812; d. Springfield, Ill., 20 Sept. 1900. He was admitted to the Kentucky bar in 1832, but in the same year volunteered for military service against the Sac and Fox Indians. Five years later he was elected to the Illinois legislature, and subsequently sat for two terms in Congress. During the Civil War he served with distinction at the battle of Fort Donelson as brigadier-general of volunteers, and was promoted major-general. He led a division at the battle of Shiloh, relieved Sherman before Vicksburg in 1863 and was in command of the 13th Army corps until 1864, when he resigned. In 1870 he was appointed circuit judge for the Sangamon, Ill., district. He presided at the National Democratic convention in St. Louis, 1876, and was appointed by President Cleveland member of the Utah Commission.

McClintock, ma-klin'tók, Emory, American actuary: b. Carlisle, Pa., 19 Sept. 1840. He was graduated from Columbia University in 1859, and afterward took special studies in chemistry. He was consular agent at Bradford, England, 1863-6, actuary of the Asbury Life Insurance Company, New York, 1867-77, and of the Northwestern Mutual Life Insurance Company, Milwaukee, 1871-89. Since the last named date he has been actuary of the Mutual Life Insurance Company, New York. He has contributed to mathematical journals.

McClintock, Sir Francis Leopold, English admiral: b. Dundalk, Ireland, 1810. He entered the British navy in 1831 and was commissioned lieutenant in 1845. He sailed on four Arctic voyages, being sent out in 1848 to search for Sir John Franklin, and again in 1850 and 1852, without discovering any traces of the explorer. In 1857 he renewed the search as commander of the Fox and brought back documentary and other evidence of Franklin's death. For his services as an Arctic explorer he was knighted in 1860, and in 1844 made admiral. His 'Voyage of the Fox' has gone through several editions.

McClintock, John, American scholar: b. Philadelphia, Pa., 27 Oct. 1814; d. Madison, N. Y., 4 March 1870. He was joint editor and compiler with James Strong of the 'Cyclopedia of Biblical, Theological and Ecclesiastical Literature' which goes by their name, the last volume of which was published in 1895. Among his other works are 'An Analysis of Watson's Theological Institutes' (1850); and 'Temporal Power of the Pope' (1853). For the last three years of his life he was president of the Drew Theological Seminary.

McCloskey, ma-klös'kī, John, American Roman Catholic prelate: b. Brooklyn, N. Y., 20 March 1810; d. New York 10 Oct. 1885. His secondary and collegiate studies were made at Mount Saint Mary's College, Emmitsburg, Md., and his post-graduate studies in France and Rome. At 24 he was ordained priest and on returning to America was assigned to Saint Joseph's Church, New York city. When Saint John's College, at Fordham (now a part of New York city), was opened in 1841, he was made its first president, but in the next year he returned to parish work. In 1844 he was ap-

pointed coadjutor to Bishop Hughes of the diocese of New York, and consecrated titular bishop of Axierien; and three years later was appointed bishop of Albany, a diocese just created from a part of the diocese of New York. For 17 years he worked for the upbuilding of the Albany diocese, and the good of his people. He built the Cathedral of the Immaculate Conception at Albany, Saint Joseph's Theological Seminary at Troy, established several new parishes, and founded educational and charitable institutions, including hospitals, orphanages, homes for the aged, and reformatories. He succeeded Archbishop Hughes in the archiepiscopal see of New York, 6 May 1864. The result of his labors in the archdiocese of New York remains his greatest monument. He was made a cardinal in 1875, under the title of Santa Maria supra Minervam. He was in attendance at the Vatican Council (q.v.) and a member of the committee on discipline. He was summoned to Rome February 1878 to attend the conclave for the election of a pope but was too late to cast a vote, Leo XIII. having been elected a few hours before his arrival. Cardinal McCloskey was noted for his gentleness, firmness, profound scholarship, and great executive ability.

McCloskey, William George, American Roman Catholic prelate: b. Brooklyn, N. Y., 10 Nov. 1823. Upon completing his studies at Mount Saint Mary's College, Emmitsburg, Md., he turned his attention to law, but subsequently changing his mind, entered Saint Mary's Theological Seminary, where he pursued a six years' course in philosophy and theology, being ordained priest 6 Oct. 1852. His first appointment was as assistant in the Church of the Nativity. In 1853 he was named professor of Latin and Sacred Scriptures in Mount Saint Mary's College and in 1857 became director of the theological seminary. When the American College was formally opened in Rome Pope Pius IX. chose Dr. McCloskey its first president, 8 Dec. 1859, a position which, for eight years, he filled to the utmost satisfaction. In 1865 he visited America in the interests of the institution under his charge and succeeded in collecting funds sufficient for its permanent endowment. Upon the death of Bishop Lavalie, Pope Pius IX. appointed Dr. McCloskey to the see of Louisville, Ky., and he was consecrated at Rome 24 May 1868. During his 36 years' administration numerous churches, schools and religious institutions have been built throughout his diocese, which now (1905) has a Catholic population of about 100,000; 169 priests; 142 churches; 58 parochial schools and 4 orphanages, besides hospitals, infirmaries, academics, etc.

McClure, ma-kloor', Alexander Kelly, American journalist: b. Sherman's Valley, Perry County, Pa., 9 Jan. 1828. He was reared on a farm, educated at home, and apprenticed to a tanner in 1842, soon after began to write for the *Perry Freeman*, and edited and published the *Juniata Sentinel* at Mifflin, Pa., in the Whig interest, 1846-50. He then published (1850-6) the *Chambersburg Repository*, which he made influential in the cause of anti-slavery. He was State superintendent of printing in 1855; a member of the State convention of 1855 which met

at Pittsburg to organize the Republican party; in 1856 was admitted to the bar, and was a delegate to the first Republican national convention in Philadelphia. In 1857-8 he sat in the legislature as a Republican, and was State senator in 1859. As leader of the Pennsylvania delegation in the Republican national convention of 1860 he aided in the nomination of Abraham Lincoln. In 1862-4 he again published the *Chambersburg Repository*, and in the latter year served as assistant adjutant-general in charge of the draft in Pennsylvania. Two years later he was again a member of the legislature, and in 1868-73 practised law in Philadelphia. He was chairman of the State delegation to the Liberal Republican convention in 1872, and of the Liberal Republican State Committee, and in that year entered the State senate. In a close election in 1873 he was defeated as an independent candidate for mayor of Philadelphia. In 1875 he established the *Philadelphia Times*, of which he was editor-in-chief till 1891. He has published 'Three Thousand Miles Through the Rocky Mountains'; 'Our Presidents and How We Make Them' (1901); 'Recollections of Half a Century' (1902); etc.

McClure, James Gore King, American Presbyterian clergyman; b. Albany, N. Y., 24 Nov. 1848. He was graduated at Yale in 1870, at the Princeton Theological Seminary in 1873, and ordained as a Presbyterian minister in 1874. He was settled (1874-9) at New Scotland, N. Y., and has been pastor at Lake Forest, Ill., since 1881. From 1897 to 1901 he was president of Lake Forest University. He has written 'Possibilities' (1896); 'The Man Who Wanted to Help' (1897); 'The Great Appeal' (1898); 'Environment' (1899); 'For Hearts that Hope' (1900); and 'A Mighty Means of Usefulness' (1901); etc.

McClure, Sir Robert John Le Mesurier, English admiral; b. Wexford, Ireland, 28 Jan. 1807; d. London 17 Oct. 1873. He began his naval career in 1824, and in 1836 under Sir John Ross made his first voyage to the Arctic regions. Again he joined an expedition sent to discover the North-West Passage in 1848. Two years later he was placed in command of an Arctic expedition and discovered Prince of Wales Strait, which connects the Atlantic and Pacific. On his return he was knighted. From his journals was published 'The Discovery of the North-West Passage' (by Captain Sherard Osborne, 1856).

McClure, Samuel Sidney, American editor and publisher; b. in County Antrim, Ireland, 17 Feb. 1857. He was graduated at Knox College, Galesburg, Ill., in 1882. In 1884 he established a newspaper syndicate which has grown to great proportions and assumed distinctive importance in the publishing world. In 1893 he founded 'McClure's Magazine,' and in 1899 established the publishing house of McClure, Phillips & Company, New York. He is also president of the S. S. McClure Company in the same city. Since 1894 he has been a trustee of Knox College.

McClurg, ma-kloorg', Alexander Caldwell, American publisher; b. Philadelphia 1834; d. St. Augustine, Fla., 15 April 1901. He was graduated at Miami University, Oxford, Ohio, in 1853, engaged in business with S. C. Griggs

& Company, publishers, in Chicago, and in 1862 entered the Union army. He was captain in the 88th Illinois regiment of infantry, rose to the rank of colonel, was made brevet brigadier-general, and in the Atlanta campaign and during Sherman's great march served as chief of staff to the 14th corps. Returning from the war, he was admitted to partnership in the publishing house above mentioned, and some years later established the firm of Jansen, McClurg & Company, afterward A. C. McClurg & Company. The business of the house prospered, and in 1899 the company was reorganized, the co-operative principle adopted, and the employees, among whom the stock was largely distributed, were granted easy terms for increasing their investments.

MacColl, ma-köl', Evan, Canadian poet; b. Kenmore, Argyllshire, Scotland, 21 Sept. 1808; d. Toronto 1898. He emigrated to Canada in his forty-second year and became known as the poet of the Scottish colony at Kingston. He wrote with fluency in Gaelic and his 'Clàreach nam Beann' created much enthusiasm among his compatriots. He is also author of many English poems, such as 'My Rowan Tree'; 'The Mountain Minstrel' (1887); and 'Poems and Songs' (1888).

McConnell, ma-kön'el, Samuel D., American Protestant Episcopal clergyman and author; b. in Westmoreland County, Pa., in 1846. He was graduated at Washington and Jefferson College in 1868, and was ordained a priest in 1873; was rector of Saint John's Church, Erie, Pa., 1872-3; held rectorships at Watertown, Conn. (1873-6) and Middletown, Conn. (1876-82); became rector of Saint Stephen's Church, Philadelphia, in 1882; of Holy Trinity Church, Brooklyn, N. Y., in 1896; and since 1902 has been rector of All Souls' Church, New York city. He has published a 'History of the American Episcopal Church' (1890); 'Sons of God' (1891); 'Sermon Stuff' (1888, 1895); 'A Year's Sermons' (1896); 'The Open Secret'; 'The Next Step in Christianity'; 'Essays, Practical and Speculative' (1900); and 'The Evolution of Immortality' (1901).

McCook, ma-kük', Alexander McDowell, American soldier; b. Columbiana County, Ohio, 22 April 1831; d. Dayton, Ohio, 12 June 1903. He was graduated at West Point in 1853, and with the commission of second lieutenant of the 3d infantry was ordered to New Mexico. In 1861 he gained his captaincy and saw much service during the Civil War. He commanded the Ohio volunteers at Bull Run and rapidly gained promotion, being appointed major-general of volunteers in 1862. His brilliant military reputation was made at the battles of Shiloh, Murfreesboro, Chickamauga, etc., and in 1865 he was brevetted brigadier-general in the regular army. He was subsequently placed in command of the military school at Fort Leavenworth, was commissioned major-general in 1894 and retired the following year. General McCook came of a fighting family. He was the son of Daniel McCook (q.v.) who was killed by Morgan's guerrillas in 1863. Seven of the general's brothers took part in the War for the Union, three of whom, like their father, were killed. Four of the eight McCook brothers attained the rank of general.

McCOOK — McCORMICK THEOLOGICAL SEMINARY

McCook, Anson George, American soldier and politician: b. Steubenville, Ohio, 10 Oct. 1835. He took part in the Civil War as captain in an Ohio regiment, and was colonel of a regiment in the Army of the Cumberland. At the end of the war he was brevetted brigadier-general. In 1873 he was elected from New York as a Republican member of Congress, and became secretary to the United States Senate from 1887 to 1889, and city chamberlain of New York from 1893 to 1897.

McCook, Daniel, American soldier: b. Canonsburg, Pa., 20 June 1798; d. near Buffington's Island, Ohio, 21 July 1863. Having received a college education, he removed from Pennsylvania to Ohio and settled at Carrollton. Although 63 years old at the outbreak of the Civil War, he entered the Union army, in which he served as major of volunteers. During one of the Morgan raids (q.v.) he received a wound from which he died shortly after. Eight sons of his served as officers in the Federal army, three of whom were killed in battle.

McCook, Henry Christopher, American clergyman and entomologist: b. New Lisbon, Ohio, 3 July 1837. He was graduated at Jefferson College (now Washington and Jefferson) in 1859, studied at the Western Theological Seminary, and in the Civil War he served as 1st lieutenant and chaplain in the 41st Illinois regiment, 1861-2. In 1862-3 he was minister of a church at Clinton, Ill.; from 1863 to 1870 labored in St. Louis as a home missionary; and subsequently became pastor of the Tabernacle Presbyterian Church in Philadelphia, a charge he still retains. He served as chaplain of the 2d regiment of Pennsylvania volunteers in the Spanish-American war, and is chaplain of the Pennsylvania Commandery of the Loyal Legion, president of the American Entomological Society, vice-president of the Academy of Natural Sciences, Philadelphia, and president of the American Presbyterian Historical Association. His writings include: 'The Gospel in Nature'; 'The Mound-Making Ants of the Alleghanies' (1877); 'The Agricultural Ants of Texas' (1879); 'Honey Ants and Occident Ants' (1882); 'Tenants of an Old Farm' (1884); 'The Women Friends of Jesus' (1885); 'American Spiders and Their Spinning-Work' (1889-93); 'The Latimers, a Scotch-Irish Historic Romance of the Western Insurrection' (1898); and 'Martial Graves of Our Fellow Heroes in Santiago de Cuba.' See article on SPIDERS by Dr. McCook in this encyclopedia.

McCook, Neb., city, county-seat of Red Willow County; on the Republican River, and on the Burlington & Missouri River Railroad; about 230 miles west by south of Lincoln, the capital of the State. It is in a rich agricultural region. McCook owes much of its prosperity to the fact that it is the headquarters of a railroad division, and has railroad shops. The sugar beet, alfalfa, wheat, and corn are the principal productions of the surrounding farms. A number of cattle are raised and a large number of live stock from Willow County and vicinity is shipped from McCook. Pop. (1900) 2,445.

McCormick, ma-kôr'mik, Alexander Hugh, American naval officer: b. in the District of Columbia, 9 May 1842. He was acting midship-

man at the United States Naval Academy, in 1859; in April 1861 entered into active service, and served in blockading squadrons throughout the Civil War. He became captain in 1892. Since the Civil War he has performed various sea duties, and has served in the department of mathematics and in that of astronomy and navigation at the Naval Academy. He was inspector of ordnance, 1876-81; made a cruise around the world, 1881-5; was assigned to the ordnance department, 1885-92; to the Asiatic station, 1892-4; was captain of the Norfolk Navy-Yard, 1894-7; member of the armor and personnel board, 1897-8; and commandant of the Washington Navy-Yard in 1898. In 1899 he was raised to the rank of rear-admiral, and was retired 26 March 1900.

McCormick, Cyrus Hall, American inventor and manufacturer: b. in Virginia 1809; d. Chicago 13 May 1884. He removed from his native State to Cincinnati in 1845, and two years later went to Chicago. In 1831 he invented an improved reaping-machine, which was patented and further improved, and which brought him great wealth and world-wide fame, with many decorations, medals, etc. He contributed liberally in 1859 to the establishment of the Presbyterian Theological Seminary of the Northwest, in Chicago. He also endowed a chair in Washington and Lee University, Virginia.

McCormick, Leander James, American inventor: b. in Virginia 1819; d. Chicago, 20 Feb. 1900. In early life he worked with his father in manufacturing reaping-machines; removed to Chicago in 1848, and entered into partnership with his brother, Cyrus Hall McCormick (q.v.), and superintended the manufacturing department of their reaping-machine plant until 1879, when the firm was incorporated as the McCormick Harvesting-Machine Company. Ten years later he retired from active business. Many of the improvements in the famous McCormick reaping-machine were made by him. In 1871 he gave an observatory with a powerful telescope to the University of Virginia.

McCormick Observatory, an astronomical station connected with the University of Virginia, near Charlottesville, Va. The funds for the construction of the observatory were principally the gift of Leander J. McCormick, and it was built in 1883-4. The principal instrument is an equatorial of 26 inches aperture, a companion instrument to the Washington 26-inch, both being the work of Alvan Clark & Sons, of Cambridgeport, Mass. The position of the observatory is lat. 38° 2' 1.2" N.; lon. 5° 14' 5.2" W.

McCormick Theological Seminary, in Chicago, Ill.; opened in 1830, under the auspices of the Presbyterians, as a department of Hanover Academy, at Hanover, Ind. Ten years after its opening, the school was removed to New Albany, Ind. Cyrus H. McCormick (q.v.) offered the institution a liberal endowment, which generous gift caused the removal of the school to Chicago, in 1859. It was for a time known as the Presbyterian Theological Seminary of the Northwest. In 1886 the present name was taken in honor of its liberal benefactor. No fees are charged for lodging or tuition, and some of its income is used in assisting worthy and needy students. In 1903 there were con-

CYRUS HALL MCCORMICK,
INVENTOR OF THE REAPING MACHINE.

nected with the seminary 10 professors and instructors and 130 students. The library contained about 25,000 volumes. The total income on productive funds and from other sources, but excluding benefactions, was about \$35,000. Its buildings and grounds were valued at nearly \$1,000,000 and its endowment funds at about \$1,000,000.

McCosh, ma-kōsh', James, Scotch-American author and educator: b. in Ayrshire 1 April 1811; d. Princeton, N. J., 16 Nov. 1894. He was educated at the University of Glasgow, which he entered at 13, and at the University of Edinburgh, where he went in 1829. He became a minister of the Church of Scotland; was settled at Arbroath in 1835, and at Brechin in 1839; but at the disruption of the Scottish Church joined the Free Church, whose organization he was active in promoting. In 1850 he published 'The Method of the Divine Government, Physical and Moral,' in which he applied the philosophy of Sir William Hamilton to questions of theology with such skill as to elicit from him the highest commendation. This work at once gave McCosh wide fame as a philosophical thinker, and in 1851 he was appointed professor of logic and metaphysics in Queen's College, Belfast, where he remained 18 years, not only discharging his professional duties, but also entering earnestly into work of religious and social improvement, through which his spirit of benevolence and his enlightened zeal for general education accomplished lasting results. In 1868 he was elected president of the College of New Jersey (now Princeton University), having previously visited this country and become impressed with its educational promise. This promise was especially bright when he assumed the presidency of Princeton, but the conditions of transition in the sphere of higher education were such as to demand consummate powers of leadership. Such powers McCosh, although a foreigner, brought to his work with most satisfying success. During the 20 years of his administration at Princeton he saw the number of students and professors more than doubled and prosperity increased in all departments. His resignation in 1888 was due to the advance of years, and he was able to continue in the chair of philosophy beyond that period. As a philosopher he maintained the principles of the Scottish metaphysicians against all empirical methods, but went beyond his predecessors in the direction of intuitionism, although he once declared that this "rose out of rationalism as fogs rise out of the melted ice," and few orthodox theologians were abreast of him in welcoming the evolutionary features of the new biology. His writings on theology, philosophy, and psychology are very numerous and include 'Typical Forms and Special Ends in Creation,' in collaboration with Dickie (1856); 'The Intuitions of the Mind Inductively Investigated' (1860); 'The Supernatural in Relation to the Natural' (1862); 'An Examination of Mill's Philosophy' (1866); 'Laws of Discursive Thought' (1869); 'Christianity and Positivism' (1871); 'The Scottish Philosophy, Biographical and Critical' (1874); 'The Development of Hypothesis' (1876); 'The Emotions' (1880); 'Psychology of the Cognitive Powers' (1886); 'Psychology of the Motive Powers' (1887); 'Realistic Philosophy Defended'

(1877); and 'Our Moral Nature' (1892). Consult Sloane, 'The Life of James McCosh' (1896).

McCown', John P., American soldier: b. Tennessee 1820. He was graduated from West Point in 1840, and was assigned to the 4th artillery; he served in the Mexican War, and was brevetted captain for gallantry at Cerro Gordo in 1847. In 1861 he resigned from the United States army to join the Confederate service, and was made brigadier-general. He commanded at New Madrid, Mo., evacuating the town when besieged by General Pope, and later served in the Tennessee campaign.

McCrackan, ma-krāk'an, William Denison, American author and lecturer: b. Munich, Germany, 12 Feb. 1864. He is of American parentage, but received his earliest education at the Latin Gymnasium, Stuttgart, Germany, and was afterward graduated at Trinity College, Hartford, Conn., in 1885. He has written 'The Rise of the Swiss Republic' (1892); 'Romance and Teutonic Switzerland' (1894); 'Swiss Solutions of American Problems'; 'Little Idyls of the Big World' (1895); and 'The Huntington Letters' (1897).

McCrack'en, Henry Mitchell, American Presbyterian clergyman and educator: b. Oxford, Ohio, 28 Sept. 1840. He was graduated at Miami University in 1857; for four years was a teacher and school superintendent; studied at the United Presbyterian Theological Seminary, Xenia, Ohio, and at the Princeton Theological Seminary, and later at Tübingen and Berlin universities. He was minister of the Westminster Church, Columbus, Ohio, 1863-7, and of the First Presbyterian Church at Toledo, Ohio, 1869-81. In 1867 he was deputy to the General Assembly of the Free Church of Scotland, and to that of the Presbyterian Church of Ireland in 1884. From 1880 to 1884 he was chancellor of the Western University, Pittsburg, Pa., and in the latter year became vice-chancellor and professor of philosophy in the University of the City of New York, of which he was made chancellor in 1891. Since then the name of the institution has been changed to New York University, and the seat of the University College and School of Applied Science has been removed to University Heights, New York city. Under his administration the Hall of Fame for Great Americans (q.v.) has been added to the university, its growth and prosperity have greatly increased, and the extension of its work and influence has given it a leading position in the field of American education. Besides numerous papers on subjects of education, religion, and philosophy, he has published 'Kant and Lotze'; 'Popular Sermons' (1875); 'Leaders of the Church Universal' (1879); 'John Calvin' (1888); 'A Metropolitan University' (1892); 'Lives of Church Leaders: or Heroes of the Cross' (1900).

McCrady, ma-krā'di, Edward, American soldier and historian: b. Charleston, S. C., 8 April 1833; d. there 2 Nov. 1903. He was graduated at Charleston College, admitted to the bar in 1855, and joined earnestly in the movement which led to the secession of his State. He took part in the capture of Castle Pinckney 27 Dec. 1860, and was present at the bombardment of Fort Sumter in the following April. As captain of the first military company raised in

McCrary — McCulloch

South Carolina for the whole war, he entered the Confederate army, 27 June 1861, was made major and then lieutenant-colonel, was badly wounded at the second battle of Bull Run (or Manassas), 30 Aug. 1862, and in January 1863 received an injury in camp from a falling tree, in consequence of which he was transferred from field service to the command of a camp of instruction at Madison, Fla., in 1864. He remained at that post until the end of the war. Later he became major-general of State troops and a member of the South Carolina legislature (1880-90). Among his more important writings may be mentioned: 'The History of South Carolina Under the Proprietary Government, 1670-1719' (1897); 'The History of South Carolina Under the Royal Government, 1719-1776' (1899); 'The History of South Carolina in the Revolution, 1775-1780' (1901); and 'The History of South Carolina in the Revolution, 1780-3' (1902).

McCrary, ma-kra'ri, George Washington, American lawyer; b. Evansville, Ind., 29 Aug. 1835; d. St. Joseph, Mo., 23 June 1890. His parents removed with him in 1836 to that part of Wisconsin Territory which is now the State of Iowa. He received a public school education, studied law, was admitted to the bar in 1856 and began practice in Keokuk, where he soon became prominent. Elected to the State legislature in 1857 he became State senator in 1861-5, and member of Congress 1868-77. In Congress introduced the law under which the judiciary of the United States was reorganized; proposed appointment of joint committee to count electoral vote in Hayes-Tilden controversy; was prominent in furthering passage of Electoral bill. He served on committees on revision of laws, naval affairs, and judiciary; was secretary of war under President Hayes 1876-9 and was judge of the 8th judicial district in 1879-84. He then resigned and settled in Kansas City, Mo., where he became general consulting attorney of the Atchison, Topeka and Santa Fe Railroad Company. He was the author of 'American Law of Elections' (1875).

McCrea, ma-kra', Jane, American woman; b. Bedminster (now Lamington), N. J., 1753; d. near Fort Edward, N. Y., 27 July 1777. She was the daughter of a Scotch Presbyterian clergyman at whose death she went to live with her brother near Fort Edward, N. Y. At the commencement of the Revolution she was betrothed to David Jones, an officer of the crown. When Burgoyne's army was advancing from the north she was visiting a Mrs. MacNeil at Fort Edward. Her brother, sharing the general alarm felt throughout the region, sent for his sister, intending to remove to a safer locality. On the morning fixed upon for her departure, a band of Indians in the employ of Burgoyne suddenly swooped down upon the MacNeil household and they, together with Miss McCrea, were made prisoners. Mrs. MacNeil and her party arrived in safety at Burgoyne's camp, but half an hour later another party of Indians arrived, bearing a number of freshly severed scalps, one of which bore the long glossy hair of Miss McCrea, whose body was later found by a roadside. The precise manner of her death never became known. The Indians claimed that she was killed by a random shot from an American detachment, whereupon her captors determined to secure the

reward for her scalp. It has been surmised that a quarrel arose among the Indians as to whose captive she was and that one of them in a frenzy tomahawked her. Other authorities credit the story that Lieutenant Jones hired the Indians to bring his betrothed to camp where they were to be married and that she was killed in a controversy which arose as to whose captive she was. Lieutenant Jones denied this story; he lived to old age, a morose and gloomy man. At all events the tragedy caused a general feeling of horror throughout America and England. Burgoyne called a council of his Indian chiefs in order to reprove them, but as his allies would have deserted him the offender was allowed to go unpunished. A blasted pine long marked the spot where tradition relates that the beautiful young girl was murdered, and her grave may be seen in a small cemetery near the ruins of Fort Edward.

McCreary, ma-kre'ri, James Bennett, American lawyer; b. Madison County, Ky., 8 July 1838. He was graduated at Centre College, Danville, Ky., in 1857, and from the Law School of Cumberland University, Tenn., 1859. He entered the Confederate army in 1862 as major of cavalry, and served until close of war. He was a member of the Kentucky House of Representatives in 1869, 1871, and 1873 (being Speaker 1871-3); governor of Kentucky 1875-79, and a member of Congress in 1885-97. He was a delegate to the International Monetary Conference at Brussels, Belgium, in 1891, and in 1903 became United States Senator.

McCree'ry, James, American merchant; b. Ireland; d. Aiken, S. C., 1893. He came to the United States when about 20 and engaged in the dry goods business in Baltimore, and at the beginning of the Civil War removed to New York, where he soon established a business of his own which made him ultimately one of New York's leading merchants. He was a member of many public boards, one of the founders of the silk industry in America, and director of numerous commercial enterprises. He was one of the Chamber of Commerce delegation sent to England two years before his death, and was a leading member of various clubs chiefly of an educational or public character.

McCulloch, ma-kul'ò, Benjamin, American soldier; b. Rutherford County, Tenn., 11 Nov. 1811, d. 7 March 1862. He became a skilled hunter and boatman, and joined other frontiersmen in settling Texas. In 1835 he served in the Texan war for independence, being in the battle of San Jacinto. He also commanded a company of rangers in the Mexican War under Taylor and Scott, did important work as a scout, and was specially distinguished at the battles of Monterey and Buena Vista, and in the siege of the City of Mexico. In 1853 he was appointed United States marshal in Texas. During the Civil War he served in the Confederate army, was appointed brigadier-general, and sent into Missouri, where he was defeated at the battle of Dug Spring, but later united his forces with those of General Price and then defeated the Federals under General Lyon (q.v.) at Wilson's Creek. He commanded a corps at the battle of Pea Ridge, Ark., where he was killed.

McCulloch, ma-kul'òh, Hugh, American financier; b. Kennebunk, Maine, 7 Dec. 1808; d. near Washington, D. C., 24 May 1895. He was

educated at Bowdoin College and went in 1833 to Fort Wayne, Ind., where he established a law practice which he continued until 1835 when he entered a branch of the State bank of Indiana. He was chosen director in 1836 and in 1837 became president of the newly incorporated State bank of Indiana. He was appointed Comptroller of the Currency in 1863 and in 1865 became Secretary of the Treasury under President Lincoln. Owing to the enormous expenses incurred by the Civil War, the finances of the country were in a critical condition; in six months the large sum due 500,000 soldiers and sailors was paid together with other heavy expenses, and a reduction of the National debt was begun. McCulloch converted more than \$1,000,000,000 of short-time obligations into a funded debt, and in less than two years had succeeded in putting the finances of the country on a sound basis. Congress approved his course and his plan for a speedy resumption of specie payment, but he met with opposition in his purpose to retire the legal-tender notes. He occupied the office until 1869 and in 1871 opened a banking business in London where he remained until 1878. He was reappointed to the secretaryship of the treasury by President Arthur in 1884 and continued in office until the close of the administration. He wrote 'Men and Measures of Half a Century,' and many of his speeches together with a large share of his correspondence have been published. He was the last living member of Lincoln's distinguished cabinet.

McCulloch, John Ramsay, English political economist: b. Isle of Whithorn, Wigtownshire, 1 March 1789; d. London, England, 11 Nov. 1864. He was educated at Edinburgh; became editor of 'The Scotsman,' an Edinburgh newspaper, and from 1818 wrote many articles for the 'Edinburgh Review.' He was professor of political economy in London University, 1828-32, and in 1838 was appointed comptroller of the stationery office. Among his many books may be mentioned: 'The Principles of Political Economy' (1825); 'Historical Sketch of the Bank of England' (1831); 'Dictionary of Commerce' (1832); 'Geographical Dictionary' (1841); 'A Treatise on the Principles and Practical Influence of Taxation and the Funding System' (1845); 'The Literature of Political Economy' (1845); etc. He also published a new edition of the works of Adam Smith (1828) and those of Ricardo (1846), both of which were accompanied by a biographical sketch. He was one of the earliest advocates of free-trade in Great Britain.

MacCullough, ma-kül'ók, John Edward, American tragedian: b. Coleraine, Ireland, 2 Nov. 1837; d. Philadelphia, 8 Nov. 1885. He came to the United States in 1853, studied for the stage and made his début in Philadelphia, 1857. He played with Edwin Forrest, who left him at his death all his manuscript plays. In 1869 he managed, with Lawrence Barrett, the Bush Street Theatre in San Francisco, Cal. His appearance in England in 1881 was not successful, but his popularity in America remained unbroken. Despite his lack of literary education, a serious handicap, he won high rank in his profession. He played De Mauprat to Edwin Booth's Richelieu, and Richmond to his Richard III. His interpretation of Virginius was un-

excelled during his day. Among his leading roles were Hamlet, Macduff, Richelieu, Spartacus, etc. In 1884, at the height of his brilliant career, he suddenly collapsed, both physically and mentally; he died a year later in an insane asylum in Philadelphia.

McCullough, John Griffith, American politician: b. Welsh Tract, near Newark, Del., 16 Sept. 1835. He was graduated from Delaware College in 1855 and from the law department of the University of Pennsylvania in 1858. He removed to California in 1859, engaged in law practice in Mariposa County, was elected to the State legislature in 1861, to the senate in 1862 and in 1863-7 was attorney-general. In 1867-73 he practised law in San Francisco and then removed to Bennington, Vt., since when he has been director and president of several railway systems and prominently connected with various banking and commercial enterprises. He was elected to the Vermont senate in 1898 and in 1902 was elected governor of the State.

MacCunn, ma-kün', Hamish, Scottish composer: b. Greenock, Scotland, 22 March 1868. He was educated in Greenock and at the Royal College of Music, London, made his début in the musical world in 1887, and in 1888 became a junior professor of harmony in the Royal Academy of Music, which position he resigned in 1894. He was director of the Hampstead Conservatory Orchestra Society in 1892. As a composer he has attained high rank; his productions are rich in melody, and his command of the orchestra is remarkable. His work is typically Scottish in character and in choice of subject. Among the more important of his numerous works are overtures, etc., 'The land of the Mountain and the Sun'; 'Chior Mhor'; 'The Dowie Dens o' Yarrow'; 'The Ship o' the Fiend'; and the operas, 'Jeannie Deans' and 'Diarmid.'

McCurdy, ma-kér'di, James Frederick, Canadian Orientalist: b. Chatham, N. B., 18 Feb. 1847. He was educated at the University of New Brunswick, Princeton Theological Seminary, and in Germany. He was assistant professor in Oriental languages at Princeton, 1873-82; and Stone lecturer there in 1885-6. In 1886 he was appointed lecturer in University College of Toronto, and since 1888 has been professor of Oriental languages in that college. Among his works are: 'Aryo-Semitic Speech' (1881); 'History, Prophecy, and the Monuments' (3 vols. 1894-1901); 'Life and Work of D. J. Macdonnell' (1897); an original commentary on Haggai, and various translations for the American edition of 'Lange's Commentary'; etc.

McCutcheon, ma-kut'chón, George Barr, American novelist: b. Tippecanoe County, Ind., 26 July 1866. He was educated at Purdue University and began his career as reporter on the Lafayette Journal in 1889. At present (1903) he is city editor of the Lafayette Courier. He has published 'Graustark' (1900); 'Castle Cranecrow' (1902); 'The Sherrods' (1903); 'The Purple Parasol' (1905).

McCutcheon, John Tinney, American cartoonist: b. near South Raub, Ind., 6 May 1870. He is a brother of G. B. McCutcheon (q.v.). He was graduated from Purdue University in 1889 and has been connected with the leading newspapers of Chicago since 1889, his work as

a cartoonist becoming famous in the campaign of 1896. He was special correspondent during the Spanish-American War, Chinese troubles, and Boer war. He has published in book form 'Cartoons by McCutcheon' (1903).

McDaniel, Henry Dickerson, American lawyer: b. Monroe, Ga., 4 Sept. 1837. He was graduated from Mercer University, Macon, Ga., and admitted to the bar in 1856. He attended as delegate the Georgia Secession Convention in 1861; and served in the Confederate Army until the end of the war, attaining the rank of major in the 11th Georgia infantry. In 1865 he was a member of the Georgia Constitutional Convention. His disability to hold office having been removed in 1872 by the United States Congress, he served in the State legislature, 1873-4; was State senator, 1874-83, and in 1883 he was elected governor of Georgia, which office he occupied for three years.

McDonald, Alexander, American politician: b. Clinton County, Pa., 10 April 1832; d. Norwood Park, N. J., 13 Dec. 1903. He was educated at Lewisburg University, Pa., and removed to Kansas in 1857. At the outbreak of the Civil War he was active in raising troops for the Federal army, supporting three regiments at his own expense for a time. He was elected to Congress from Arkansas on the re-admission of that State to the Union.

Macdonald, Etienne Jacques Joseph Alexandre, â-të-ën zhâk zhô-zef âl-ëks-ândr mäk dô-nâl, DUC DE TARENTE, French soldier: b. Saucerre, France, 17 Nov. 1765; d. Courcelles, France, 24 Sept. 1840. He served in the French Revolution as Colonel, brigadier-general, and general, and in 1798 was made governor of the Roman states, and of Naples in 1799. He was made a marshal of France for his services at Wagram 6 July 1809.

Macdonald, George, Scottish poet and novelist: b. Huntly, Aberdeenshire, 1824; d. Ashted, Surrey, 18 Sept. 1905. He was educated at Aberdeen University and at King's College, London, and entered the Independent ministry, from which he retired and became a lay member of the English Church. Macdonald's work comprises poetry, novels, religious, and juvenile books and is marked by deep religious feeling and devotion to lofty ideals of life. His novels deal chiefly with Scottish character and scenery. The best-known of his many books are: 'David Elginbrod' (1862); 'Alec Forbes of Howglen' (1865); 'Annals of a Quiet Neighborhood' (1866); 'Robert Falconer,' his best work (1868); 'The Miracles of Our Lord' (1870); 'The Marquis of Lossie' (1877).

Macdonald, Sir Hector, British general: b. Scotland 1853; d. Paris, France, 25 March 1903. In 1870 he enlisted and served in the ranks nine years. He was with Sir F. Roberts at Cabul, and for brilliant service at Candahar was made 2d lieutenant. He served in the Boer war of 1881 and was captured at Majuba Hill. He was conspicuous for bravery at Suakim in 1888; was at the capture of Takar in 1891; and was placed in command of the forces in Egypt, 1897-8. He was in command at Magersfontein in 1899 and was then transferred to South Africa, where he commanded the Highland Brigade, 1899-1901. He was made K.C.B. and in 1902 was placed in command at Ceylon.

Summoned home in 1903 on a charge of immoral conduct, he went to a hotel in Paris and committed suicide. The committee of inquiry reported (October 1903) that there was not a scintilla of evidence to substantiate the charges preferred against him and reported virtually that it was an instance of a proud, sensitive man assassinated by slander.

MacDonald, James Wilson Alexander, American sculptor: b. Steubenville, Ohio, 25 Aug. 1824. He studied in St. Louis and in New York. Among his works are statues of 'Joan of Arc'; 'Italia'; Edward Bates (1876) in Forest Park, St. Louis; Gen. Custer, at West Point; Fitz-Greene Halleck in Central Park, New York; an equestrian statue of Gen. Nathaniel Lyon; numerous busts, etc.

Macdonald, Sir John Alexander, Canadian statesman: b. Glasgow, Scotland, 11 Jan. 1815; d. Ottawa, Ont., 6 June 1891. In early youth he emigrated with his father to Canada. At twenty-one he was a practising barrister at Kingston, Upper Canada, and in 1844 he was elected to the Canadian Parliament for that constituency. While repudiating the name of Tory, throughout his career Macdonald was the most conspicuous figure in the Conservative party in Canada. He became a cabinet minister in 1847, and, after various vicissitudes of his party, prime minister in 1857. Macdonald's most important work is connected with the federation of Canada. The French and the English provinces, previously independent, had been united under one parliament in 1841, and during the next twenty-five years each party had both an English and a French leader. Ministries changed rapidly, and in 1864 there was a deadlock. This made necessary some wider union; and in that year a conference of delegates met at Quebec to consider the federation of British North America. Directed largely by Macdonald's tact and resource this conference led to the establishment of the Dominion of Canada in 1867, under the British North American Act, passed by the British Parliament. Macdonald became the first prime minister of the Dominion. At first there were only four provinces but he carried through successfully the negotiations by which the Hudson Bay company ceded its interests in the northwest to Canada; he secured also the entrance of British Columbia on the condition of building rapidly a transcontinental railway. During an election in 1872 Macdonald accepted large sums for party purposes from Sir Hugh Allan, one of the chief projectors of the Pacific railway, and in 1873 owing to this "Pacific Scandal" he was forced to retire from office. In 1878 he again became prime minister with a policy of protection and he may be regarded as the father of that system in Canada. He remained prime minister until his death in 1891. The confederation of Canada, the acquisition by Canada of the Northwest, the building of the Intercolonial and the Canadian Pacific railways, and the policy of protection were all effected under Macdonald's lead. His brilliant intellect and ready wit made him a really great leader. In 1867 he was created K.C.B., in 1884 G.C.B., and on his death his widow was created Baroness Macdonald in her own right.

GEORGE M. WRONG,
Professor of History, University of Toronto.

MCDONALD — MACDOUGAL

McDonald, John Bartholomew, American contractor and railroad constructor: b. Ireland 7 Nov. 1844. He was brought to this country in 1847, and received his education in the public schools of New York. Among his successful undertakings may be mentioned the 4th Avenue improvement for sinking the New York Central Railroad tracks in New York city from 42d Street to Harlem; West Shore Railroad from Weehawken to Buffalo; Baltimore & Ohio Railroad from Baltimore to Philadelphia; Illinois Central Railroad from Elgin, Ill., to Dolgeville, Wis.; the Georgian Bay branch of the Canadian Pacific Railroad; the Trenton "cut-off" of the Pennsylvania Railroad; the Baltimore Belt Railroad, which carried the great Baltimore & Ohio Railroad under the city of Baltimore; etc. He constructed the Jerome Park Reservoir, New York city, the largest artificial storage reservoir in the world. His greatest contract was for the construction, equipment, operation and maintenance of the Rapid Transit Railroad (the "Subway") in New York city.

Macdonald, John Sandfield, Canadian statesman: b. St. Raphael's, Canada, 12 Dec. 1812; d. Cornwall, Ont., 1 June 1872. He was self-educated and admitted to the bar in 1840, practising successfully in Cornwall. In 1841 he was elected to the Canadian Parliament as member from Cornwall and re-elected in 1843, 1848, 1852, and 1854. Macdonald was solicitor-general in 1849-51; 1852-4 was Speaker of Parliament; in 1857 was member of Parliament for Cornwall; and premier for Cornwall in 1862-4; in 1867-71 he was premier for Ontario.

McDonald, Joseph Ewing, American lawyer: b. Butler County, Ohio, 29 Aug. 1819; d. Indianapolis, Ind., 21 June 1891. He was educated at Ashbury University; studied law and was admitted to the bar and established a practice in Crawfordsville, where he was county prosecuting attorney, 1845-7. In 1848 he was member of Congress and from 1856-60 attorney-general of Indiana. He then practised law in Indianapolis and in 1864 was an unsuccessful candidate for governor. In 1872 he was chairman of the Democratic State Committee and in 1875 was elected to the United States Senate, serving until 1881, when he returned to Indianapolis where he resumed the practice of law.

Macdonell, māk-dōn'ēl, Alexander, Canadian Roman Catholic prelate: b. Invernesshire, Scotland, 1762; d. Dumfries, Scotland, 14 Jan. 1840. He was educated at the Scots College, Spain, entered the priesthood in 1787, and was for several years a missionary. He assisted in the organization of the Glengarry Fencibles and was their chaplain, and in 1803 established for its disbanded members a colony in Glengarry County, Ontario, Canada. He also assisted in raising the Canadian regiment of Glengarry Fencibles, which was actively engaged in repelling the American invaders in the War of 1812-4. In 1820 he was made Apostolic Vicar of Upper Canada, and through his influence 48 parishes were established in Canada. He was the first Roman Catholic bishop in Upper Canada and died in Scotland while on a mission to obtain funds for the founding of a seminary in his see.

McDonnell, Charles Edward, American Roman Catholic prelate: b. New York, N. Y.,

1 Feb. 1854. He studied at the De La Salle Institute and Saint Francis Xavier's College in that city, but finished his theological course at the American College, Rome, Italy. While there he received the degree of D.D., and was ordained priest by Bishop Chatard 18 May 1878. Returning to America the same year, he was appointed assistant at St. Mary's Church, New York city, and in 1879 was transferred to Saint Patrick's Cathedral. On the death of Bishop Loughlin, Dr. McDonnell, who, at the time was Archbishop Corrigan's secretary, was named bishop of Brooklyn, being consecrated by Archbishop Corrigan 25 April 1892. At his invitation the Benedictine Fathers have come from the Bahama Islands to establish themselves in his diocese, and the Redemptorists also have made a foundation in Brooklyn. He is spiritual adviser of the Catholic Benevolent Legion, and also honorary president of the International Catholic Truth Society. The diocese (1905) has a Catholic population of about 500,000; 290 diocesan priests; 154 churches; 68 parochial schools; 1 diocesan seminary; 12 orphan asylums and 6 hospitals, besides academies, colleges, and charitable institutions.

McDonogh, māk-dōn'ō, John, American philanthropist: b. Baltimore, Md., 29 Sept. 1779; d. McDonogh, La., 26 Oct. 1850. He was educated at an academy in Baltimore and entered the mercantile business there, removing in 1800 to New Orleans, where he rapidly acquired great wealth. He was deeply interested in the problem of slavery and devised a system through which his slaves were enabled to earn their freedom; he educated those among them who desired it, and sent to Africa shiploads of those who had earned their freedom. He was president of the American Colonization Society and was a generous contributor to its support. The bulk of his fortune of more than \$2,000,000 he bequeathed to the cities of New Orleans and Baltimore for the establishment of free schools. The will was adjudged valid after years of litigation and Baltimore established the McDonogh schools while New Orleans invested its portion of the bequest in its public schools.

Macdonough, māk-dōn'ō, Thomas, American naval officer: b. Newcastle County, Del., 23 Dec. 1783; d. at sea 18 Nov. 1815. He entered the navy as midshipman in 1800 and in 1803 was attached to the frigate Philadelphia, one of the squadron employed against Tripoli. On 26 Aug. 1803 the Philadelphia captured off the coast of Spain the Moorish frigate Mesboa and Macdonough, being left at Gibraltar with the prize, escaped the subsequent capture which befell the officers and crew of the Philadelphia. In 1804 he participated in the various attacks made upon Tripoli and under Decatur assisted in the capture and destruction of the Philadelphia, 16 Feb. 1804. In 1814 he had command of the squadron on Lake Champlain which gained an important victory over the British squadron commanded by Commodore George Dowie. For his valuable services on this occasion he was promoted to the rank of captain, then the highest in the United States navy, and received from Congress a gold medal.

Maddougal, mak-doo'gal, Daniel Trembly, American botanist: b. Liberty, Ind., 16 March 1865. He was graduated at De Pauw University in 1890 and studied in Germany. In 1891-2

he was engaged in explorations in Arizona and Idaho for the United States government, and in 1893-9 was instructor in plant physiology at the University of Minnesota. He was appointed director of the laboratories of the New York Botanical Gardens in 1899. Among his books are: 'Nature and Work of Plants' (1900); 'Practical Text-book of Plant Physiology' (1902); etc.

McDougall, Alexander, American soldier: b. Island of Islay, Scotland, 1731; d. New York 8 June 1786. He emigrated with his father to America in 1755 and later became a merchant in New York. He devoted himself to the cause of the colonies and was imprisoned for a time. At the outbreak of the Revolution he enlisted in the American army, serving as colonel, brigadier-general, and in 1777 was promoted major-general. He commanded at White Plains and also attained distinction in the action at Germantown. He was elected member of the Continental Congress in 1781 and was for a time minister of marine. Re-elected in 1784-5 he served for a time and then resigned, preferring active service in the field. He was a member of the New York State senate at his death.

McDougall, Walter Hugh, American artist: b. Newark, N. J., 10 Feb. 1858. He attended a military academy, and from the age of 16 was self-educated, beginning his artistic work in 1876. He entered upon a distinct career in 1884 by the introduction of newspaper illustration and cartooning in the daily press. His writings include 'The Hidden City' (1886); 'Number 11' (1890); 'History of Christopher Columbus' (1892); 'The Rambilicus and His Friends'; and 'A Marvellous Journey' (in the *New York World*, 1889).

MacDougall, William, Canadian journalist and statesman: b. Toronto 1822; d. Ottawa, 29 May 1905. He studied at Victoria College, Cobourg; was admitted to the bar in 1847; in 1848 established the 'Canada Farmer'; in 1850 founded the 'North American,' afterward united with the Toronto *Daily Globe*, for which he wrote until 1870. He was a member of the Executive Council, 1862-4, serving also as commissioner of the crown lands; provincial secretary, 1864-9; and acting minister of marine in 1866-7. In 1867 he became minister of public works, and was made lieutenant-governor of Rupert's Land, Northwest Territories, in 1869. In 1865-6, as chairman of a commission, he did efficient work for the extension of Canadian trade, and in 1873 represented Canada as special fisheries commissioner in London. He published 'Six Letters on the Amendment of the Provincial Constitution' (1872).

MacDow'ell, Edward Alexander, American composer: b. New York city 19 Dec. 1861. He was educated at the Paris Conservatory and in Germany, and in 1881 was head of the Darmstadt Conservatory, his specialty being the pianoforte and composition. He resigned his position in 1884 and in 1896 was appointed professor of music at Columbia University. In 1896-8 he was director of the Mendelssohn Glee Club of New York and in 1897-8 president of the American Society of Musicians. He is well-known as a pianist and his work as a composer is justly famous. His compositions are marked for their delicate charm, their beauty of expres-

sion and poetry of movement, and include concertos, sonatas, symphonies, songs, and pianoforte pieces, among which are: 'Woodland Sketches'; 'Forest Idylls'; 'Lancelot and Elaine'; etc.

McDowell, Irvin, American soldier: b. near Columbus, Ohio, 15 Oct. 1818; d. San Francisco, Cal., 5 May 1885. He studied in France and was graduated from West Point in 1838. During the Canadian troubles he was stationed on the Niagara and on the Maine frontiers, and in 1841 served at West Point as assistant instructor in tactics, becoming adjutant in 1845. In 1845 he went to Mexico as aide-de-camp to Gen. Wood and for gallant conduct at Buena Vista in 1847 was promoted brevet captain, shortly afterward attaining the rank of assistant adjutant-general. Subsequently he was stationed at the War Department in Washington and in 1856 was raised to the rank of brevet-major. He was on Gen. Wood's staff at the outbreak of the Civil War and assisted in inspecting and organizing the volunteer troops at Washington. In May 1861 he was made brigadier-general of the volunteers and given command of the Army of the Potomac. Constrained by the impatience of the North, McDowell moved in July to meet the enemy and despite his carefully laid plan met a disastrous defeat at Bull Run, 21 July 1861, owing to the imperfect organization of his raw recruits. Shortly after McClellan was given command of the army and McDowell was retained at the head of one of its divisions. In 1862 he was promoted major-general of volunteers and placed in command of the First corps, which became the Army of the Rappahannock, stationed to guard Washington. In August 1862 he received command of the Third corps of the Army of Virginia and fought under Gen. Pope at the battles of Cedar Mountain, Rappahannock Station, and the second battle of Bull Run, where he performed especially good service. He was removed from the field in September 1862. Considering this action of the War Department a direct reflection upon his military services, he asked for an investigation, the result of which was favorable to him. In July 1864 he was placed in command of the Department of the Pacific Coast, and in March 1865 was made brevet major-general in recognition of his gallant services at Cedar Mountain. In 1872 he succeeded Gen. Meade as major-general in the regular army. The last years of his life were spent in California.

McDowell, James, American politician: b. in Rockbridge County, Va., 1796; d. 1851. He was graduated at Princeton in 1817; in 1831 was elected to the Virginia legislature; was governor of that State, 1842-4, and from 1847 to 1851 represented it in Congress. He favored the gradual abolition of slavery, although advocating the claims of State rights. As orator and debater in Congress he bore a prominent part in the proceedings of that body.

McDowell, Battle of. When Gen. Banks marched upon the Shenandoah Valley from Winchester to Strasburg and Harrisonburg in April 1862, Gen. Jackson fell back and took position at Swift Run Gap in the Blue Ridge, on the 19th. Banks occupied Harrisonburg on the 26th where he was stopped by President Lincoln's order, and 1 May was ordered back to Stras-

burg. Jackson thought Banks' intention when at Harrisonburg was to advance on Staunton, 25 miles distant, and watched an opportunity to strike him in flank, when he should make the movement; but Banks did not give him the opportunity, and meanwhile Staunton was threatened from another direction. Edward Johnson's command of about 3,000 men, with three batteries, which had held Monterey 50 miles from Staunton, on the road to West Virginia, was being driven back by the brigades of Milroy and Schenck, Milroy arriving at McDowell, 12 miles east of Monterey, 1 May, where he awaited a junction with Schenck, who had been ordered to march from Romney and Moorefield, thence to join Milroy by way of Franklin. Edward Johnson pressed by Milroy in front and threatened by Banks in rear, had fallen back to West View, seven miles from Staunton, 20 April. On the afternoon of the 30th Jackson, leaving Ewell's division at Swift Run Gap to watch Banks, marched with 8,000 men and a good supply of artillery to Mechum's River Station of the Virginia Central Railroad, from which point the troops were taken by train to Staunton, his artillery and trains taking the road through Rockfish Gap. By the evening of 5 May all his troops had arrived, and on the afternoon of the 6th Edward Johnson advanced through Buffalo Gap, pushed back Milroy's advance parties on the 7th, and on the morning of the 8th reached Sitlington's Hill, where, two miles distant in the valley beyond he saw Milroy drawn up to receive him. Schenck, by a forced march from Franklin, joined Milroy at 10 A.M., with about 1,500 men. He was not impressed with the advantages of the position for an engagement, but as Milroy had prepared for it he let him fight the battle, which was opened by the artillery against the hill where Johnson was forming his command. A desultory artillery fire and skirmishing was kept up until late in the afternoon, when Milroy advanced and made a determined effort to drive Johnson from position. Jackson had now come up, and in quick succession he sent in his regiments to Johnson's assistance. The fighting was close and sanguinary, Milroy's men gaining partial advantages and reaching at points the crest of the hill; but Jackson's position was too good and his numbers too great to be overcome, and as it was growing dark, Milroy withdrew to McDowell. The Union forces engaged numbered about 2,500 men; their loss was 28 killed and 225 wounded. The Confederates had about 6,000 engaged and lost 75 killed, and 424 wounded. Schenck buried his dead, on the morning of the 9th withdrew from McDowell, and by easy marches reached Franklin on the 11th. Jackson remained at McDowell on the 9th and marching on the 10th, overtook Schenck at Franklin on the 12th, where he was found so strongly posted that he deemed attack inadvisable, and that afternoon set out on his return march to McDowell, thence to Mount Solon in the Shenandoah Valley, where he prepared for the campaign that began with the defeat of one of Banks' detachments in an engagement at Front Royal (q.v.), 23 May, his expulsion from Strasburg on the 24th and ended with his defeat at Winchester (q.v.), 25 May 1862, and his retreat across the Potomac. Consult: 'Official Records,' Vol. XII.; Allan, 'Jackson's Valley Cam-

paign'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.
E. A. CARMAN.

Macduff, māk-dūf', Scottish thane, or Earl of Fife, commemorated in Shakespeare's play 'Macbeth'; d. Lumphanan, Aberdeenshire, in 1057. He was the principal agent in the overthrow of the usurper Macbeth, and the restoration of Malcolm Canmore to the throne of Scotland. For this he was granted many privileges, among them that of a place of refuge to which he and his descendants could flee in case of committing unpremeditated murder. This sanctuary, in the form of a cross, stood till 1559 in the pass leading to Strathearn. It was then demolished by the Reformers, but its pedestal yet remains.

McDuffie, māk-dūf'ī, **George**, American statesman and orator: b. in Columbia (now Warren) County, Ga., 1778; d. in Sumter District, S. C., 11 March 1851. He was graduated at South Carolina College in 1813, admitted to the bar in 1814, and in 1818 elected to the South Carolina legislature. From 1821 to 1834 he was a member of Congress, and from 1834 to 1836 governor of South Carolina. In 1843 he took his seat in the United States Senate, resigning on account of impaired health in 1846. In his political views and in his congressional career, he was a close follower of J. C. Calhoun (q.v.), being at the outset a liberal constructionist in constitutional questions, but afterward becoming a strong opponent of the tariff and other economic policies of the government, and also a bold advocate of nullification. Although a supporter of Andrew Jackson (q.v.) in 1828, he became bitterly antagonistic to him, not only in respect to the tariff and State rights, but especially so on the question of the United States Bank, which, as chairman of the committee on ways and means, he strongly defended against the hostile policy of the President. In 1832, as a member of the South Carolina Nullification Convention, he drafted the address of South Carolina to the people of the United States. He was one of the ablest orators of his day, and his prominence in public affairs was maintained in spite of an early wound received in a duel, from which he suffered for the remainder of his life.

Mace, **Frances Parker Laughton**, American poet: b. Orono, Maine, 15 Jan. 1836; d. Los Gatos, Cal., 20 July 1890. She was graduated from the Bangor High School, Maine, in 1852 and in 1855 was married to B. H. Mace, a Bangor lawyer. After 1885 she resided in California. She published 'Legends, Lyrics, and Sonnets' (1883); 'Under Pine and Palm,' poems (1887); 'Only Waiting,' her best known poem, attained great popularity.

Macé, **Jean**, zhōn mā-sā, French educator and writer: b. Paris, France, 22 April 1815; d. there 13 Dec. 1894. He was educated at the Collège Stanislas, served in the French army, 1842-45, was editor of 'La République' in 1848, and subsequently taught school in Alsace for 10 years. In 1866 he founded a league of instruction in the Belgian manner. He was decorated with the Legion of Honor in 1880, and elected senator in 1883. He was the author of many popular books for young people, the aim of which was mainly educational, among them

his best known work, 'Contes de Petit-Chateau' (1862), called in the English translation 'Home Fairy Tales'; 'History of a Mouthful of Bread' (1861); 'Servants of the Stomach' (1866); 'France Before the Franks' (1881).

Mace, an aromatic spice made from the arillode or false aril which covers the seed of a nutmeg (*Myristica fragrans*). The yellow external covering of the nutmeg (q.v.) being removed, the red, rather fleshy, arillode which partially conceals the nutmeg is encountered. After drying in the sun for several days this becomes more or less translucent and usually orange yellow and waxy. In this form it is largely exported from the Spice Islands, where it is native, and from the West Indies, where it has been introduced into cultivation. The powerful but agreeable nutmeg-like odor and flavor characteristic of it are due to a volatile oil which is obtained by distillation for use in perfumery and culinary articles. A buttery fixed oil obtained by expression is used after the admixture of the volatile oil under the names nutmeg balsam and nutmeg butter. White mace is obtained from *M. otoba* and red mace from *M. tingens*; also a low grade from *M. fatua*, but this is rarely found in the market. Mace is also largely used whole or ground in cookery.

Mace, a weapon of war formerly in use in Europe, chiefly among the cavalry, as late as the 16th century, and still used among savage tribes. It consists merely of a staff about five feet long, with a knob at the end made of iron or some other heavy substance. The knob was sometimes covered with spikes. In England the mace is used as an emblem of the officers of state, before whom it is carried. It is made of the precious metals, or of copper, gilt, and ornamented with a crown, globe, and cross.

Macedo, Joaquim Manuel de, hō-ä-kēn', mā'noo-el dā mā-sā'dō, Brazilian poet, novelist, and statesman: b. province of São João d'Itaborahi 24 June 1820; d. Rio de Janeiro 11 April 1882. He studied medicine, but presently began to write and became professor of national history in the College of Rio Janeiro. He was one of the most prominent of Brazilian authors in the 19th century, and being keenly interested in politics was elected to the Brazilian Chamber in 1854. His works include: 'Moreninha,' a novel (1844; 5th ed., revised, 1877); 'O Moço Loura,' a novel of the early stages of the Portuguese conquest (1845); 'O Dous Amores' (1848); 'Vicentina' (1853); 'A Nebulosa,' a poem (1857), his greatest work, consisting of six cantos in unrhymed hendecasyllables; 'Cotie,' a drama; 'Fantasma Branco,' a comedy (1856); 'Corógraphia do Brasil' (1873); etc.

Macedonia, mäs-e-dō'nī-ä, Turkey, an ancient monarchical territory now comprised in the Turkish vilayets or provinces of Monastir and Salonika, and inhabited by a turbulent, heterogeneous population of Turks, Greeks, Bulgarians, Servians, Wallachians, Albanians, and Jews. Its earliest name was Emathia, which remained the name of the district between the Haliacmon and the Axios, two rivers falling into the Thermaic Gulf, now the Gulf of Saloniki. This district was the earliest seat of the Macedonian monarchy. There was also an older form of the name Macedonia, namely Macetia, whence the Macedonians were sometimes called Macetæ, even after the name Macetia had come

to be disused. In the time of Herodotus the name Macedonia was applied only to the district situated south and west of the Lydias, another river which falls into the Thermaic Gulf, and which flows between the two already mentioned. Philip of Macedonia extended his kingdom as far as the Lake of Lynchnitis, in Illyria, in the west, Mount Scardus and Mount Orbelus in the north (so as to include the whole of Pæonia), and the River Nestus on the northeast. He added also the peninsula of Chalcidice. The part which he conquered from Thrace, lying between the Strymon and Nestus, was called *Macedonia adjecta*. The provinces of Macedonia were, in general, known by name before the time of Herodotus. In the time of Philip there were 19. Macedonia was inhabited by two different races—the Thracians, to whom belonged the Pæonians and Pelagionians, and the Illyrians. The language of the southern Macedonians shows that there must have been a large admixture of Dorian settlers among them. Pliny speaks of 150 different tribes who dwell here at an early period. They were divided into several small states, which were incessantly at war with the Thracians and Illyrians, till Philip and Alexander gave the ascendancy to one, and made it the most powerful in the world. The first of these princes, who came to the throne in 359 B.C., taking advantage of the strength of the country and the warlike disposition of its inhabitants, reduced Greece, which was distracted by internecine broils, in the battle of Chaeronea, 338 B.C. His son, Alexander, subdued Asia, and by an uninterrupted series of victories for 10 successive years made Macedonia in a short time the mistress of half the world. After his death this immense empire was divided. Macedonia received anew its ancient limits, and after several battles lost its dominion over Greece. The alliance of Philip V. with Carthage during the second Punic war gave occasion to this catastrophe. The Romans delayed their revenge for a season; but when Hannibal was conquered they sent over T. Quintus Flamininus, who defeated Philip at the battle of Cynoscephalæ (197 B.C.), and compelled Philip to sue for peace, which was only granted upon his agreeing to acknowledge the independence of Greece, to surrender his vessels, to reduce his army to 500 men, and defray the expenses of the war. Perseus, the successor of Philip, having taken up arms against Rome, was totally defeated at Pydna by Paulus Æmilius, 168 B.C., and the Romans took possession of the country. Indignant at their acts of oppression, the Macedonian nobility and the whole nation rebelled under Andriscus. But after a long struggle they were overcome by Quintus Cæcilius Macedonicus; the nobility were exiled, and the country became a Roman province, 148 B.C. As such it is mentioned in the New Testament, and St. Paul's letters to the Thessalonians and Philippians are addressed to Macedonian Christians. In 395 A.D., after the dissolution of the Roman Empire, Macedonia became part of the Byzantine Empire. It came under Turkish domination in the 15th century. While the name has no modern territorial significance, it has come into considerable political prominence in connection with the conflict of nationalities in European Turkey, among whom the only object in common is a desire to throw off Turkish rule, the Bulgarians there desiring to be governed from Sofia, the Servians from

Belgrade, the Greeks from Athens, and the Turks by the Young Turk Party when it shall be established in Constantinople.

In addition to this question of nationality is one of religion, which complicates matters considerably. There are seven chief religious sects in Macedonia, the adherents of the original Greek Church, those of the schismatic Bulgarian Church, those of the New Greek Church, who recognize the Patriarch in Constantinople, those Bulgarians and Servians, converts of American missionaries, who call themselves Protestants; the Wallacks, who are an offshoot of the ancient Greek Church; those who practise the Jewish faith, and the Mohammedans.

The Turkish government, in administering the affairs of Macedonia, adopted the principle of assisting and protecting the weak and of snubbing and persecuting the strong or predominating party; thus, in a certain district where the Greek is strongest he is least popular with the Turkish authorities. Near the Bulgarian frontier, where the Bulgarian element is practically held in subjection, several public offices are held by Greeks, and so on.

This mode of government led in 1895 to a Bulgarian uprising and in 1896 to a Greek revolt, but would probably long since have proved its success from a Turkish point of view were it not for the fact that the Macedonian Committee in Sofia, a society formed for the purpose of conducting a nationalist campaign in Macedonia to effect freedom from Turkish rule, discovered its real nature and set about to disrupt it. The result was the insurrection in 1903 headed by Boris Sarafoff, the avowed aim of which was to provoke the Turks to massacre Christians and to commit acts that would arouse Christendom and compel the Great Powers to expel them from Europe. The insurrection was crushed by the Porte, with a comparative absence of the atrocities and cruelties that formerly characterized Turkish warfare. Autonomous institutions had been provided for Macedonian Christians by the Berlin Congress of 1878, and Austria and Russia, acting with the authority of Europe, now drew up a drastic reform scheme which provided that civilian agents of the two governments must accompany the Turkish inspector-general, to direct his attention to the needs of the population, and to report to their governments what is done and what left undone. The reorganization of the police in the disturbed vilayets is to be put under the charge of a foreign officer. Mixed commissions of Mohammedans and Christians are to report on crimes and outrages. The sultan is to be "requested" to allot funds for the repatriation of exiles, for the immediate needs of the populations, and for the rebuilding of their homes. Taxation of the expelled Christians is to be remitted for a year, while the formation of bands of Bashi-Bazouks is to be absolutely prevented.

Macedonians, followers of Macedonius, author of the Macedonian heresy. The Macedonians came into existence toward the decline of the Arian controversy; when Macedonius became Patriarch of Constantinople (341), and taught that the Holy Ghost was "subordinate to the Father and to the Son, unlike to them in substance, and a creature." He was a semi-Arian, was deposed by the Arians in 360; and his special tenets condemned at the Council of

Constantinople in 381. In that council the clauses defining the nature of the Holy Ghost were added to the Nicene Creed.

Maceio, mã-sã-yô', Brazil, formerly MACAYO, city and capital of the state of Alagoas, on the Atlantic coast, 135 miles from Pernambuco. The city has a cathedral, lyceum, government, and other buildings. It has manufactures of machinery and cotton goods, and considerable ship-building is carried on here. Pop. 12,000.

McEntee, mǎk'ën-tē, **Jervis**, American landscape painter: b. Rondout, N. Y., 14 July 1828; d. there 1891. He studied with F. E. Church (q.v.), and opened a studio in New York in 1858. His reputation was soon established, and he attained high rank among American artists. He became a member of the American Academy of Design in 1861. As a painter of mountain scenery and of autumn and winter landscapes he especially excelled, although in figure painting he also achieved some notable successes. Among his principal works are: 'Indian Summer' (1861); 'October Snow' (1870); 'Cape Ann' (1874); 'Winter in the Mountains' (1878); 'The Kaatskills in Winter' (1884); and 'Shadows of Autumn' (1886).

Maceo, mã-sã'ô, **Antonio**, Cuban patriot: b. Santiago de Cuba 14 July 1848; d. near Mariel 2 Dec. 1896. He joined the insurgent army as a private in 1868 and though without martial training his natural military ability and personal magnetism as a leader soon brought him to the front, making him second only to Gomez. Under his skillful leadership Martinez Campos was defeated at Demajagua and at La Galleta; his campaign in Baracoa in 1878 evidenced masterly generalship, as did also his utter rout of Santacledes at San Ulpiano. Maceo alone of all the Cuban generals refused to sign the peace of Zanjon and made for two months a brave effort to reanimate the exhausted revolutionary spirit. Finding his copatriots thoroughly discouraged, he abandoned the struggle and still refusing to sign the peace, made a tour of the United States and other countries in America seeking support for the cause of Cuban independence. He was the first of the Cuban leaders to land in 1895, and in the revolution which followed took a prominent part. His achievements in the campaign in Pinar del Rio Province, and his battles at Paralijo, Jobito, Mal Tiempo, and Candelaria are among the most brilliant feats in the history of Cuba's long struggle for independence. While crossing the trocha between Majana and Mariel, attended only by his staff, he was surrounded by a Spanish force and killed.

Maceo, José, hō-sã', Cuban patriot: b. Santiago de Cuba 1846; d. La Lama del Gata, Cuba, 5 July 1896. He was a brother of Antonio Maceo (q.v.) and took a conspicuous part in the rebellion of 1868-78. He remained in Santiago de Cuba after the peace of Zanjon, which he with his brother refused to sign. He was prominently connected with the uprising of 1879 in which he was captured and sent to Spain. An attempted escape to Gibraltar resulted in his deportation to the fortress La Mola at Mahon, in the Balearic Isles, whence he succeeded in making his escape to Algiers. He lived in Costa Rica from 1885 until the outbreak of the

rebellion in Cuba in 1895, when he at once joined the insurrectionary army. He raised a large force which he commanded with signal success at Jobito and later was victorious over Canellas at Sao del Indio. He was killed in a furious engagement at La Loma del Gata in which the Cubans were finally victorious.

Macerata, mā-chā-rā'tā, Central Italy, (1) an episcopal city, capital of the province of the same name, picturesquely situated on an eminence 1,207 feet high, between the Apennines and the sea, 21 miles south of Ancona. It is encircled by walls, pierced by six gates, has a cathedral, provincial palace, and theatre on the central public square, a college founded in 1290, museum, etc. Pop. of commune (1901) 22,784. (2) The province has an area of 1,087 square miles. Pop. (1901) 259,429.

MacFadden, **Bernarr Adolphus**, American editor and athlete: b. near Mill Springs, Mo., 16 Aug. 1868. He is editor and proprietor of 'Physical Culture,' and of 'Macfadden's Physical Development,' and 'Beauty and Health' (monthly magazines), etc. From 1890 to 1893 he was an athlete of some prominence in the wrestling arena, and he has invented various devices for physical exercise. Among his many publications are: 'The Athlete's Conquest'; 'The Strenuous Lover' (a physical-culture novel); 'Macfadden's Physical Training'; 'The Virile Powers of Superb Manhood'; 'Strength From Eating'; 'Fasting, Hydropathy, and Exercise'; 'Strong Eyes'; 'Physical Culture Cook-Book'; 'Power and Beauty—Superb Womanhood'; etc.

MacFarren, **SIR George Alexander**, English composer: b. London, England, 2 March 1813; d. there 31 Oct. 1887. He was educated at the Royal Academy of Music, where in 1837 he became a professor of symphony and harmony, and in 1875 principal. In the same year he was elected professor of music in Cambridge University. Among his compositions are the operas 'The Devil's Opera' (1838); 'Robin Hood' (1860); and the oratorios 'St. John the Baptist' (1860); 'King David' (1883); etc. He also wrote several valuable treatises: 'Harmony' (1860); 'Counterpoint' (1869); etc. He was knighted in 1883. After 1860 he was blind and his wife wrote his compositions from his dictation.

McFaul, **James Augustine**, American Roman Catholic prelate: b. Larne, County Antrim, Ireland, 6 June 1850. At an early age he attended St. Vincent's College, Beatty, Pa., finishing his classical studies at St. Francis Xavier's College, New York city, and subsequently pursuing his theological course at Seton Hall. South Orange, N. J. He was ordained priest 26 May 1877, Jersey City, Newark and New Brunswick, N. J., being each in turn the scene of his first labors in the ministry. In 1878 he was named assistant at St. Mary's Church, Trenton, N. J., and afterwards pastor of the Church of Our Lady Star of the Sea, Long Branch, N. J., some years later assumed the rectorship of the Cathedral at Trenton and then became chancellor and vicar general of the diocese. On the death of Bishop O'Farrell in 1894 Father McFaul was chosen his successor, being consecrated at Trenton 18 October of that

year. Noteworthy among his achievements are the erection of an orphan asylum at Hopewell and of a home for the aged at Laurenceville, N. J. He is the author of some excellent articles on 'American Citizenship' and was a leading power in forming the Young Men's Diocesan Union. However, he is perhaps best known as the founder of the Federation of Catholic Societies. The diocese of Trenton now (1905) has a Catholic population of about 95,000; 142 priests; 100 churches with resident priests; 40 missions with churches; 29 parochial schools; 2 orphanages; 1 hospital and other charitable and educational institutions.

McFingal, māk fīng'gal, a political satire in verse by John Trumbull, 1774-82. The poem aims to give in Hudibrastic verse a general account of the Revolutionary War, and a humorous description of the manners and customs of the time, satirizing the follies and extravagances of the author's own Whig Party as well as those of the British and Loyalists. McFingal is a Scotchman who represents the Tories; Honorius being the representative and champion of the patriotic Whigs. The first canto was published in 1774, and the poem finally appeared complete in four cantos in 1782. The work is now comparatively unknown, but its popularity at the time of its issue was very great; and more than 30 pirated editions in pamphlet and other forms were printed. It contains many couplets famous at the time, some of which are still quoted. Two that are perhaps the most famous, and are often attributed to Samuel Butler, the author of 'Hudibras,' are—

"No man e'er fell the halter draw
With good opinion of the law;"

and

"But optics sharp it needs, I ween,
To see what is not to be seen."

McFlimsey, māk fīm'zī, **Flora**, the heroine of the once famous poem 'Nothing to Wear,' by William Allen Butler (q.v.). It was published in 1857 and became immediately popular.

McGaffey, **Ernest**, American poet and critic: b. in Ohio, August 1861. For several years he was a contributor in prose and verse to Chicago newspapers, and afterward became critic on the Saturday literary edition of the *Chicago American*, then private secretary to Carter H. Harrison, mayor of Chicago. He has published 'Poems of Gun and Rod' (1892); 'Poems' (1895); 'Poems of the Town' (1900); and 'Sonnets to a Wife' (1901).

MacGahan, **Januarius Aloysius**, American journalist and war correspondent: b. near New Lexington, Ohio, 12 June 1844; d. Constantinople 9 June 1878. He followed different callings in Western States, then went to Europe and studied law in Brussels. Upon the outbreak of the Franco-German war in 1870 he went to the field as correspondent of the *New York Herald*, and thenceforth devoted himself to journalism. In 1873, after heroic exertions, with extreme hardships, he reached the Russian army before Khiva and sent to the *Herald* reports of the campaign which won for him high admiration both here and in Europe, his account of the capitulation of the city being regarded as "a masterpiece of military journalism." Returning to America, he went to Cuba to report on the Virginian affair, then to Spain, upon the Carlist

uprising, where he spent 10 months with the army of Don Carlos, was captured by the Republicans, mistaken for a Carlist, condemned to death, and saved by the intervention of the United States minister. He then went to England, and in 1875 accompanied the Arctic expedition on the Pandora. In 1876 he joined the Turkish army, in the service of the London *Daily News*, and did memorable work in his description of the Bulgarian atrocities, his accounts standing approved before the world in face of all attempts to discredit them. In behalf of Bulgaria he appealed to Russia, was at the front in the Russo-Turkish war that followed, and was hailed as a chief instrument of Bulgaria's resulting independence. While nursing a friend he contracted a fever which in a few days caused his death. In 1884 the Ohio legislature secured the removal of his body from its foreign grave to its final resting-place at New Lexington. He wrote 'Campaigning on the Oxus, and the Fall of Khiva' (1874); 'Under the Northern Lights' (1876); and 'Turkish Atrocities in Bulgaria' (1876).

McGarvey, John William, American educator: b. Hopkinsville, Ky., 1 March 1829. He was graduated at Bethany College, West Virginia, in 1850; for 12 years preached at Fayette and Dover, Mo., and in 1863 at Lexington, Ky.; and since 1865 has been professor of sacred history at the College of the Bible, Lexington. Of this college, a department of Kentucky University, he has been president since 1895. He is a clergyman of the Christian (Disciples) Church, and for 40 years has been connected with religious journalism. He has written: 'Commentaries on the Acts of the Apostles' (1863-93); 'Commentaries on Matthew and Mark' (1875); 'Lands of the Bible' (1881); 'Text and Canon of the New Testament' (1886); 'Credibility and Inspiration of the New Testament' (1891); 'McGarvey's Sermons' (1894); 'Jesus and Jonah' (1897); and 'The Authorship of Deuteronomy' (1902).

McGee, ma-gē', Anita Newcomb, American physician: b. Washington, D. C., 1864. She is a daughter of Simon Newcomb (q.v.); was educated at Newnham College, Cambridge, England, at the University of Geneva, and at other institutions in Europe; also graduated in medicine at Columbian University, 1892, and took a post-graduate course in gynecology at the Johns Hopkins Hospital. From 1892 to 1896 she practised in Washington. In 1888 she married W J McGee (q.v.). She has held prominent positions in the National Society of the Daughters of the American Revolution, and from April to September 1898 was director of its Hospital Corps, which selected women nurses for army and navy. In August 1898 to December 1899 she was acting assistant surgeon in the United States army, being the first woman to hold such a position, and was assigned to duty in the surgeon-general's office, where she organized the army nurse corps.

McGee, Thomas D'Arcy, Canadian journalist and politician: b. Carlingford, Ireland, 13 April 1825; d. Ottawa, Ontario, 7 April 1868. He was connected with the Young Ireland party and was obliged to flee to the United States at 17, where he engaged in journalism. In 1845 he returned to Ireland, but his journalistic writings compelled him to again escape to the United

States in 1848. McGee then edited the New York 'Nation' for two years, after which he became a Royalist and went to Canada, where he was editor of 'The New Era.' He entered Parliament in 1857 and was a member until his assassination, which was the result of his opposition to the Fenian movement. He published: 'History of Ireland' (1862); 'Speeches and Addresses of the British-American Union' (1865); etc.

McGee, W J, American scientist: b. in Dubuque County, Ia., 17 April 1853. He was self-educated, and from 1873 to 1875 surveyed land and practised in the courts. In 1877-81 he made geologic and topographic surveys of north-eastern Iowa, and for the United States Geological Survey he surveyed and mapped 300,000 square miles in the southeastern part of the country, and has performed many other important services in the departments of geology, ethnology, and anthropology. From 1893 to 1903 he was ethnologist in charge of the Bureau of American Ethnology. He is president of the American Anthropological Association, chief of the Department of Anthropology and Ethnology of the Louisiana Purchase Exposition, and associate editor of the 'National Geographic Magazine.' He has written: 'Geology of Chesapeake Bay' (1888); 'Pleistocene History of Northeastern Iowa' (1891); 'The Lafayette Formation' (1892); 'Potable Waters of the Eastern United States' (1894); 'The Siouan Indians' (1897); 'Primitive Trephining in Peru' (1898); and many scientific memoirs.

McGiffert, ma-gif'ert, Arthur Cushman, American theologian and author: b. Sauquoit, N. Y., 4 March 1861. He was graduated at the Western Reserve College in 1882, and at Union Theological Seminary in 1885; and at Union studies at the universities of Berlin and Marburg, Germany, and in France and Italy. In 1888-90 he was instructor in Church history at Lane Theological Seminary, Cincinnati, and professor there 1890-3, since when he has been professor of Church history at Union Theological Seminary, New York. In 1897 he published 'A History of Christianity in the Apostolic Age,' and in consequence of criticism and threatened denominational disturbance, involving his own probable trial for heresy, to which this book gave rise, he withdrew from the Presbyterian ministry, and later, while still retaining his professorship, joined the Congregational Church. His other publications include 'Dialogue Between a Christian and a Jew,' Doctor's thesis (1888), and a translation of Eusebius' 'Church History,' with prolegomena and notes (1890).

McGiffin, ma-gif'in, Philo Norton, American naval officer: b. Washington County, Pa., 1860; d. New York 11 Feb. 1897. He was graduated in 1882 at the United States Naval Academy, and was stationed in China, and at the outbreak of the war between China and France was permitted to resign from the United States navy to enter the service of China. He established a naval academy at Wei-hai-wei, of which he had charge. When the China-Japan war broke out he was placed in command of the Chen Yuen, and was the first American or European to command a modern warship in action. He was in command at the battle of Yalu River, in which action he was so severely injured that he afterward shot himself at a hospital in New York.

McGill, ma-gil', James, Canadian philanthropist: b. Glasgow, Scotland, 6 Oct. 1744; d. Montreal, P. Q., 19 Dec. 1813. He was educated in Glasgow and in 1770 removed to Canada, where he engaged in the northwest fur-trade, afterwards becoming a merchant in Montreal. McGill was a member of the lower Canadian parliament, also of various councils, and was a brigadier-general in the War of 1812. He used much of his wealth in philanthropic work and at his death founded McGill College in Montreal.

McGill College and University, in Montreal, Canada, was founded in 1811 by James McGill (q.v.). By will he left an estate known as the "Burnside Estate," which contained 47 acres of land and a fine Manor House, near Montreal, and £10,000 to the "Royal Institution for the Advancement of Learning," for the establishment of a university in Lower Canada (province of Quebec). The bequest was valued at the time as worth about \$120,000. It was stipulated that one of the colleges of the university should be known in perpetuity as McGill College.

McGill College and University stands at the head of a group of schools and colleges and is affiliated with Cambridge, Oxford, and Dublin universities. Many generous benefactors have supplied means for the foundation of various schools. Lord Strathcona and Mount Royal erected and endowed the Royal College for Women. This school is a residential college, and is only one of many gifts from the same donor. Sir William Macdonald erected, equipped, and endowed the Macdonald Chemistry and Mining Building, the Macdonald Physics Building, and the Macdonald Engineering Building. He also gave \$200,000 endowment to the Law School. Peter Redpath gave the University Library and the Peter Redpath Museum.

The degrees conferred by the University are B.A., M.A., B.Sc., M.Sc., D.Sc., and D. Litt., in the Faculty of Arts, and to both men and women; B.C.L. and D.C.L. in the Faculty of Law; B. Arch., B.Sc., M.Sc., and D.Sc. in the Faculty of Applied Science, and M.D., and C.M. in the Faculty of Medicine. There are four affiliated theological colleges which adjoin the university grounds. The supreme authority rests with the Crown and is exercised by the Governor-general of Canada. The Governors, fifteen in number, are the members of the "Royal Institution for the Advancement of Learning" above mentioned. The president of the Board of Governors is ex-officio the chancellor. The vice-chancellor is the principal, who is the head of the academic department and chief administrative officer. He is ex-officio the vice-chancellor. The Fellows number 43, and are chosen from all the faculties, affiliated colleges and other bodies, with due regard to the representation of each. In 1903 there were connected with the university, 1,186 students and 113 professors and lecturers, besides a large number of demonstrators. The library contained about 101,000 volumes. The grounds and buildings, in July of 1904, were valued at \$2,300,000; the endowment fund was about \$3,375,000 and the receipts (including gifts) for the year, \$335,750.

J. A. NICHOLSON,
Registrar of the University.

MacGillicuddy (ma-gil'-i-küd'i) Reeks, Ireland, a picturesque mountain range, in County Kerry, extending for 13½ miles from the lakes of Killarney on the east to Lough Carra on the west, and covering an area of 28 square miles. It is the loftiest mountain range in Ireland, several peaks rising above 2,500 feet.

McGillivray, ma-gil'-vrā, Alexander, chief of the Creek Indians: b. in Alabama about 1740; d. Pensacola, Fla., 17 Feb. 1793. His father was a Scotsman of good family and his mother a half-breed. He received a good education at Charleston, S. C.; was placed in a mercantile establishment in Savannah; but soon returned to the Creek country, where he became partner in a large trading house, and rose to a high position among the Indians. After the death of his mother he became chief of the Creeks, styling himself their emperor. During the Revolution the McGillivrays, father and son, were zealous adherents of the royal cause, the former holding the rank of a colonel in the British service. After the war Alexander McGillivray, in behalf of the Creek confederacy, entered into an alliance with Spain, of which government he was made a commissary, with the rank and pay of colonel. In 1790 he was induced by Washington to visit New York, where he eventually signed a treaty yielding certain disputed lands lying on the Oconee. He was rewarded with an appointment as agent for the United States, with the rank and pay of brigadier-general.

MacGillivray, William, Scottish naturalist: b. Old Aberdeen, Scotland, 25 Jan. 1796; d. there 5 Sept. 1852. He was graduated at King's College, and in 1823 was assistant professor of natural history at the University of Edinburgh; later was conservator of the museum of the Royal College of Surgeons in Edinburgh, and in 1841 was appointed professor of natural history at Marischal College, Aberdeen. He published: 'Lives of Eminent Zoologists' (1834); 'A History of British Birds' (5 vols. 1837-62); etc.

McGilvary, Evander Bradley, American linguist and philosopher: b. Bangkok, Siam, 19 July 1864, of American parents. He was educated at Bingham School, N. C., and Davidson College, graduating at the latter in 1884. He was appointed as instructor in the classics at Bingham School in 1884, and in 1889-90 studied at Princeton Theological Seminary. From 1891 to 1894 he was translator for the Presbyterian Board of Foreign Missions in Siam, and in 1894 began graduate work at the University of California, where he later became assistant professor. In 1899 he was appointed Sage professor of moral philosophy at Cornell. He has translated the Gospels of Matthew, Luke, and John, and the Acts of the Apostles into the Lao dialect of Siamese.

McGlynn, ma-glin', Edward, American clergyman: b. New York 27 Sept. 1837; d. Newburg, N. Y., 7 Jan. 1900. He was educated at the College of the Propaganda in Rome, and from 1866 was pastor of St. Stephen's Church in New York. He favored the education of children by the State rather than in parochial schools, and in 1886 warmly supported the candidacy of Henry George for the mayoralty, thereby bringing upon himself the censure of the Church. He was summoned to Rome to exculpate himself, but refused to go, pleading his

ill-health. Persisting in his refusal he was excommunicated in 1887. He was one of the founders of the Anti-Poverty Society and was its president. In 1893, after a hearing before the Pope's delegate, Mgr. Satolli, the ban of excommunication was removed, after signing a document drawn up by the apostolic delegate to the effect that his economic views were not in conflict with the Catholic faith. He was in charge of St. Mary's parish in Newburg at his death.

McGovern, ma-gōv'ern, John, American author: b. Troy, N. Y., 18 Feb. 1850. He was connected for 16 years with the Chicago *Tribune*, and since 1880 has been engaged in literary work and lecturing, chiefly on great writers and historical characters. In the action of S. E. Gross, author of the play 'The Merchant Prince of Cornville,' against Edmond Rostand, author of 'Cyrano de Bergerac,' he acted as literary expert for the former, furnishing in the case over 700 exhibits containing innumerable parallels between the two dramas. The United States Court at Chicago issued a decree in 1902 sustaining the claim of Gross to priority of authorship and forbidding the representation of 'Cyrano de Bergerac' in this country. McGovern's numerous writings include: 'The Empire of Information' (1880); 'A Pastoral Poem' (1882); 'The Toiler's Diadem' (1885); 'Under the Open Sky' (1890); 'King Darwin,' a novel (1894); 'American Statesmen' (1898); 'Famous Women of the World' (1898); 'John McGovern's Poems' (1902); etc.

MacGowan, John E., American journalist: b. Mahoning County, Ohio, 30 Sept. 1831; d. Chattanooga, Tenn., 12 April 1903. He was educated at Hiram College and practised law in Iowa and Ohio until the outbreak of the Rebellion in 1861, when he enlisted in the Federal army and served through the war; he was mustered out of service brevet brigadier-general. MacGowan's career as a journalist began in 1872 and he was prominently connected with the leading newspapers of Tennessee. He was a forceful writer and exerted a wide influence throughout the South. From 1878 until his death he was editor-in-chief of the Chattanooga *Times*.

MacGrady, ma-grā'di, Thomas, American Roman Catholic clergyman: b. Lexington, Ky., 11 June 1863. He was educated at Saint Joseph's College, Bardstown, Ky., and after theological studies at Kankakee, Ill., was ordained to the priesthood April 1887. He served at the cathedral in Galveston, Texas, for a short time, and was then rector at Houston, Texas (1888-90); at Dallas, Texas; at Lexington and Cynthiana, Ky.; and at Saint Anthony's Church, Bellevue, Ky. (1895-1902). Besides attending to his clerical duties, he wrote and lectured frequently on economic and social subjects, and his views were so radical that he was severely criticised, and was requested by the ecclesiastical authorities to retract his writings, but refused to do so, and resigned from his position in December 1902, though not withdrawing from the priesthood. His writings are avowedly socialistic, and several of them are approved and sold by the Socialist party; they include 'The Mistakes of Ingersoll' (1898); 'The Two Kingdoms' (1899); 'Beyond the Black Ocean' (1901); 'City

of Angels' (1901); 'A Voice from England' (1902); and 'The Clerical Capitalist' (1902).

McGrath, Harold, American journalist and novelist: b. Syracuse, N. Y., 4 Sept. 1871. He was educated in Syracuse, and has been engaged in journalism since 1890. He has written: 'Arms and the Woman' (1899); 'The Puppet Crown' (1901); 'The Grey Cloak' (1903); and 'The Princess Elopes' (1905).

McGready, ma-grā'di, James, American Presbyterian clergyman: b. in Pennsylvania about 1760; d. 1817. He studied for the ministry in the school of John McMillan, of Canonsburg, Pa., and in 1778 was licensed to preach. After some years of work in North Carolina, in 1796 he removed to southwestern Kentucky, and under his direction began the great revival of religion which culminated in 1800 and became memorable in the religious history of the country. He organized and conducted the first camp-meeting, and employed as preachers unordained young men without special theological training, thereby provoking dissension in the Presbyterian Church. Out of this disagreement arose the Cumberland Presbyterian Church (see PRESBYTERIAN CHURCH), organized in 1810. McGready, however, afterward became reconciled to the older church and resumed his fellowship in it. Two volumes of his sermons were published years after his death, the first at Louisville, Ky., in 1831, the second at Nashville, Tenn., in 1833. Consult: Davidson, 'History of the Presbyterian Church in the State of Kentucky' (1847); Foote, 'Sketches of North Carolina, Historical and Biographical' (1850; 2d series, 1855); Smith, 'History of the Cumberland Presbyterian Church'; Edson, 'Early Presbyterianism in Indiana' (1898).

Machærodus, mā-kē'rō-dūs, a genus of huge extinct cats, fossil in the Miocene and subsequent formations, and including the largest of the *Nimravida*. See SABRE-TOOTHED TIGER.

McHenry, James, American politician: b. Ballymena, Ireland, 1753; d. 1816. He had studied at Dublin, when, about 1771, he came to this country, and in Philadelphia soon entered upon the study of medicine under Dr. Benjamin Rush (q.v.). On the outbreak of the Revolution he became surgeon of the 5th Pennsylvania battalion; in November 1776 was taken prisoner at Fort Mifflin; was paroled in the following January, and in March 1778 exchanged. In May of that year he was made assistant private secretary to Washington, and held that position until October 1780, when as major he was appointed to a place on the staff of Lafayette. Elected in 1781 to the Maryland Senate, he continued a member of that body until 1786, being also during the second half of that period a delegate to the Confederation Congress. In 1787 he was made a member of the Constitutional Convention; in 1789 was elected to the General Assembly of Maryland, and sat in the Senate of that State, 1791-6, when he was appointed by Washington secretary of war, retaining that position in the Cabinet under John Adams' administration until 1800. As an ardent Federalist he used his influence in favor of a strong national defense, and was a zealous partisan of Alexander Hamilton. After resigning from Adams' Cabinet he spent the rest of his life in Maryland. Fort McHenry (q.v.) was named after him.

McHenry, māk-hēn'ri, James, American physician and author; b. Larne, Ireland, 20 Dec. 1785; d. there 21 July 1845. He was educated in Dublin and Glasgow and in 1817 emigrated to the United States and finally settled in Philadelphia, where he practised medicine and was engaged in mercantile business. In 1842 he was appointed United States consul at Londonderry and held that post until his death. Among his works are: 'The Usurper: an Historical Tragedy' (played in Philadelphia 1820); 'O'Halloran, or the Insurgent' (1824); 'The Betrothed of Wyoming' (2d ed., 1830); etc.

McHenry, Fort. See FORT McHENRY.

Machete, ma-chā'tā, a short sword-like tool, half knife, half cleaver, used in Cuba and other countries of tropical America for cutting cane and as a weapon in war. It was first brought into prominence during the Cuban revolution.

Machias, ma-chi'as, Maine, town, county-seat of Washington County; on the Machias River, and on the Washington County railroad; about 120 miles east by north of Augusta. It is about 12 miles from the mouth of Machias River. A trading post was established here in 1633, by Englishmen, but after a few months they were forced by the French to abandon the place. The first permanent settlement was made in 1763, and in 1784 it was incorporated as a town. It was besieged by the British from 1 August to 1 November 1777, and other attacks were made later. The original township of Machias was divided into East Machias, Machiasport, Marshfield, and Whitneyville.

The chief industries are ship-building, lumbering, and fishing. It has considerable coast trade. The principal buildings are the Government building, the court-house, the United States Marine Hospital, and the Porter Memorial Library. Pop. (1900) 2,082. Consult; 'Memorial of the Centennial Anniversary of the Settlement of Machias.'

Machiavelli, Niccolò, nē-kō-lō' mā-kē-ā-vel'li or māk-i-a-vel'li, Italian historian and statesman, possibly the greatest prose writer of the Italian Renaissance: b. Florence 3 May, 1469; d. there 22 June 1527. Of Niccolò's early life and education we know nothing. No trace of him remains previous to his 26th year. But of his times and the scenes amid which he grew up, we know much. It was the calm but demoralizing era of Lorenzo the Magnificent. Machiavelli was a true child of his time. He too was thoroughly imbued with the spirit of the Renaissance; and looked back, fascinated, on the ideals of that ancient world that was being revived for the men of his day. But philosophy, letters, and art were not the only heritage that the bygone age had handed down; politics—the building of states and of empire—this also had engaged the minds of the men of that age, and it was this aspect of their activity that fired the imagination of the young Florentine. From his writings we know he was widely read in the Latin and Italian classics. But Virgil and Horace appealed to him less than Livy, and Dante the poet was less to him than Dante the politician; for he read his classics, not as others, to drink in their music or be led captive by their beauty; but to derive lessons in statecraft, and penetrate into the secrets of the successful em-

pire-builders of the past. It is equally certain, from a study of his works, that he had not mastered Greek. Like Ariosto, Machiavelli was indebted for his superb literary technique solely to the study of the literature of his own nation.

With the expulsion of the Medici from Florence, Machiavelli, at 30, emerged from obscurity to play a most important role in the Florentine politics of the succeeding decade and a half. In 1498 he was elected secretary to the Ten of War and Peace, and from 1498 to 1512 was a zealous, patriotic, and indefatigable servant of the republic. His energy was untiring, his activity ceaseless and many-sided. He conducted the voluminous diplomatic correspondence devolving upon his bureau, drew up memorials and plans in affairs of state for the use and guidance of the Ten, undertook the reorganization of the Florentine troops, and went himself on a constant succession of embassies, ranging in importance from those to petty Italian states up to those to the court of France and of the Emperor. He was by nature well adapted to the peculiar needs of the diplomacy of that day; and the training he received in that school must in turn have reacted on him to confirm his native bent, and accentuate it until it became the distinguishing characteristic of the man. His first lessons in politics and statecraft were derived from Livy's history of the not over-scrupulous Romans; and when he comes to take his lessons at first hand, it is in the midst of the intrigues of republican Florence, or at the court of a Caterina Sforza, or in the camp of a Cesare Borgia. Small wonder that his conception of politics should have omitted to take account of honesty and the moral law; and that he conceived "the idea of giving to politics an assured and scientific basis, treating them as having a proper and distinct value of their own, entirely apart from their moral value."

During this period of his political activity we have a large number of state papers and private letters from his pen; and two works of literary cast. These are his 'Decennale': historic narratives, cast into poetic form, of Italian events. The first treats of the decade beginning 1404; and the second, an unfinished fragment, of the decade beginning 1504. They are written in easy *terzine*; and are noteworthy as expressing the sentiment for a united Italy.

When in 1512 the Medici returned to Florence in the train of her invader, Machiavelli was dismissed from his office and banished for a year from the confines of the city. Later, on suspicion of being concerned in a plot against the Medici, he was thrown into prison and tortured. He was afterward included in a general pardon granted by Leo X. But Machiavelli did not return to public life until 1525; and this interval of enforced leisure from affairs of state was the period of his literary activity. A number of comedies, minor poems, and short prose compositions did not rise above mediocrity. But in one dramatic effort he rose to the stature of genius. His 'Mandragola' achieved a flattering success, both at Rome and in Florence. It has been pronounced the finest comedy of the Italian stage, and Macaulay rated it as inferior only to the greatest of Molière's. In its form, its spontaneity, vivacity, and wit, it is not surpassed by Shakespeare; but it is a biting satire on religion and morality, with not even a hint of a moral to redeem it.

His lesser prose works are the 'Life of Castruccio Castracani,' and the 'Art of War,' a treatise anticipating much of our modern tactics. A more ambitious undertaking, and his largest work, is the 'History of Florence.' At the suggestion of the Cardinal de' Medici, the directors of the studio of Florence commissioned Machiavelli to employ himself in writing a history of Florence, "from whatever period he might think fit to select, and either in the Latin or the Tuscan tongue, according to his taste." He was to receive one hundred florins a year for two years to enable him to pursue the work. He chose his native tongue; and revised and polished his work until it became a model of style, and in its best passages justifies his claim to the title of the best and most finished of Italian prose writers.

But though Machiavelli had the historical style, he lacked historical perspective; he arranged his matter not according to objective value, but placed in the boldest relief those events that best lent support to his own theories of politics and statecraft. He makes his facts to be as he wishes them, rather than as he knows them to be. To Machiavelli history was largely to be written as a *Tendenzroman*,—manufactured to point a preconceived moral. Though Machiavelli wrote history, poetry, and comedy, it is not by these he is remembered. The works that have made his name a synonym, and given it a place in every tongue, were written almost in the first year of his retirement from political life: 'The Prince' and the 'Discourses on the First Ten Books of Titus Livius.' Each is a treatise on statecraft; together they form a complete and unified treatise, and represent an attempt to formulate inductively a science of politics. The 'Discourses' study republican institutions, 'The Prince' monarchical ones. The first is the more elementary and would come first in logical arrangement. But in the writing of them Machiavelli had in view more than the foundation of a science of politics. He was anxious to win the favor of the Medici; and as these were not so much interested in how republics are best built up, he completed 'The Prince' first, and sent it forth dedicated "to the magnificent Lorenzo, son of Piero de' Medici." In the 'Discourses,' the author essays "a new science of statesmanship, based on the experience of human events and history." In that day of worship of the ancient world, Machiavelli endeavors to draw men to a study of its politics as well as its art. In Livy he finds the field for this study.

In his commentary on the course of Romulus in the founding of Rome, we find the keynote of Machiavelli's system of political science. His one aim is the building of a state; his one thought, how best to accomplish his aim. Means are therefore to be selected, and to be judged, solely as regards their effectiveness to the business in hand. Ordinary means are of course to be preferred; but extraordinary must be used when needed.

In 'The Prince,' a short treatise of 26 chapters, and making little more than a hundred octavo pages, Machiavelli gives more succinct and emphatic expression to the principles of his new political science. It is the best known of all his works. It is the one always connected with his name, and which has made his name famous. For the model of his prince, Machiavelli took Cesare Borgia, and cites him as an

example worthy of imitation; and he has shared in the execration that posterity has heaped upon Borgia. The strangest moral contradictions abound throughout 'The Prince,' as they do in all Machiavelli's writings. He is saint or devil according as you select your extracts from his writings.

Shakespeare, reflecting English thought, uses his name as the superlative for craft and murderous treachery. But later years have raised up defenders for him, and his rehabilitation is still going on. He has been lauded as "the noblest and purest of patriots"; and more ardent admirers could "even praise his generosity, nobility, and exquisite delicacy of mind, and go so far as to declare him an incomparable model of public and private virtue."

His rehabilitation proceeds from two causes. Later research has shown that perhaps he only reflected his time; and his works breathe a passionate longing for that Italian unity which in our day has been realized. He may be worthy canonization as a national saint; but those who are more interested in the integrity of moral standards than in Italian unity will doubtless continue to refuse beatification to one who indeed knew the Roman *virtus*, but was insensible to the nature of virtue as understood by the followers of Christ. And no amount of research into the history of his age can make his principles less vicious in themselves. A better understanding of his day can only lessen the boldness of the relief in which he has heretofore stood out in history. He was probably no worse than many of his fellows. He only gave a scientific formulation to their practices. He dared openly to avow and justify the principles that their actions implied. They paid to virtue the court of hypocrisy, and like the Pharisee of the earlier time, preached righteousness and did evil; but Machiavelli was more daring, and when he served the devil, disdained to go about his business in the livery of heaven. Among the editions of the collective works of Machiavelli may be mentioned those of Milan, 1810-11; Florence, 1813; Milan, 1821-2; Florence, 1826, 1843; and Florence (6 vols., 1873-7); Boston English translation (1891). Consult Villari, 'Niccolo Machiavelli e i suoi tempi (1877-82), English translation (1892); Tommasini, 'La vita e gli scritti di Niccolo Machiavelli (1882); Mourrisson, 'Machiavel' (1883).

Machine Composition. See COMPOSING MACHINES.

Machine Engraving, a mechanical process for engraving on wood, metal or stone. Since 1880 numerous machines have been invented to produce regular tints, geometrical and other designs and patterns, far more rapidly than by hand work. The most complex engraving is now executed wholly by machinery. Engraving by mechanical means is now generally employed in the making of bank-notes, diplomas, stock certificates and other papers and documents, where special designs are required. Elaborate gearing systems have been introduced whereby the cutting tools execute a certain number of symmetrical motions and thus produce elaborate geometrical patterns.

Machine Gun. See ORDNANCE.

Machinery-Manufacturing Industry in America. Owing to the restrictive measures of Great Britain this industry got a late start in

MACHINERY MANUFACTURING INDUSTRY

America; but once a beginning had been made, the very laws by which the mother country sought to make us dependent on her proved more effective in the development of our machinery-manufacturing industry than the most rigid system of protective tariff would have been. Great Britain wished to confine manufactures to her shores and compel the American colonists to buy their manufactured articles from English factories. At first the colonists were not allowed either to manufacture or to import machinery. In the year 1774 a statute was enacted by Parliament instituting the restrictive system as to textile machinery. This statute was made more stringent in 1781, and it was not actually repealed till 1845. This act prohibited the exportation of "any machine, engine, tool, press, paper, utensil, or implement whatever, which now is, or may at any time be, used in or proper for the preparing, working, pressing, finishing, or completing of the linen, cotton, wool, or silk manufactures of this kingdom, or any other goods wherein wool, silk, or cotton is used, or any part of such machine, etc., or any model or plan of any such machine," under penalty of forfeiture of the tools or machine, the payment of a fine of £200, and imprisonment for one year. Further, foreigners were prohibited, under a penalty of £500 and imprisonment for twelve months, "from seducing artificers, and others employed in the manufactories, to depart out of this kingdom; and if any artificer has promised or contracted to go into foreign parts to practise or teach his trade, such artificer may be obliged to give security, at the discretion of the court, that he shall not go beyond the seas, and may be committed to prison until he give such security."

These laws were rigidly enforced; and it was seldom that they were evaded. It was impossible even to smuggle a textile machine into this country; and the models that were surreptitiously imported were imperfect. Tench Cox, the coadjutor of Alexander Hamilton in the Treasury Department, made arrangements to have models of Arkwright's patents sent to him; but before they could be shipped they were detected and forfeited. In 1786 the General Court of Massachusetts appointed a joint committee to investigate textile machinery; and this led later to the employment of Samuel Slater and to the real beginning of machinery-manufacture in this country. Slater landed at New York 17 Nov. 1789; and in the following January he made arrangements with Messrs. Brown & Almy, of Providence, R. I., to construct for them textile machinery on the English plan. He made most of the machinery with his own hands and set it up at Pawtucket, R. I. This was the first textile mill in this country to use the Arkwright system. It was opened 20 Dec. 1790. It must be remembered that Slater brought with him from England no implements to work with, and no plans or models. He had to carry everything in his head. Alexander Hamilton called him "the father of American manufactures"; but, in the first place, he was the father of American machinery. Up to the time of his coming there were no machines in this country, with the exception of the rude sawmill, grist-mill, and fulling-mill; some rolling and slitting mills, foot-lathes, and a few rough carding and spinning appliances. The first carding-machine worked in the United States was constructed at

Newburyport, Mass., in 1793, by John and Arthur Scofield. Until then the household looms were the only domestic source of supply of woollen cloth.

At this time the manufacture of metal working machinery was in its infancy. The lathe was known only in its simplest form, *i. e.*, two dead centres supporting the work as it was rotated backward and forward by a band around it, one end attached to a spring-pole above it, the other end to the foot of the operator, who held the turning-tool in his hand. Even after the lathe had been provided with a revolving spindle and centre to support and rotate the work, the tools used for turning both wood and iron were still manipulated by hand. The increasing demand for accurately-cut cylindrical iron pieces, which could not be made by hand led to the general use of the slide-rest. Formerly used only by the optician and the maker of mathematical instruments, it now became a necessary adjunct of the lathe. This gave the lathe practically unlimited capacity to turn out exact cylindrical work; but, in order for the slide-rest to do its work, it had to be manipulated by the workman. The next step was naturally the introduction of the slide-lathe, by which the rotation of the work and the advance of the cutting tool are accomplished automatically. Owing to the lack of suitable tools to make the long flat surfaces required in such a machine, the slide-lathe had a curious development. The hammer, file, cold-chisel, and straight edge were the only tools at hand. The planing-machine was the next development of the slide-rest. It worked an era in the life of the machinist as great as that of the slide-rest itself. It is doubtful when the first planing-machine was made in the United States; but we know that there were only four such machines in this country in 1838. With this machine the rough and uneven surfaces of castings could be smoothed and reduced to true planes. Till now the drill had been limited to a revolving vertical spindle. The boring-mill or vertical lathe was now possible and took its place in the machine-shop for the execution of a large class of turned work that did not require to be supported on centres, such as wheels to be keyed upon their shafts. In fact, the first development of the planing-machine was the key-seating machine. It was soon recognized that such a machine could be turned to other work, and further changes were made accordingly. It was provided with compound slide-rests, with a revoluble table mounted thereon and in this form it took its place as a standard tool in the machine-shop under the name of the slotting-machine. This planer, with its vertically movable tool, was the progenitor of a machine with similar attachments, but with its tool moving horizontally, upon which work could be conveniently shaped in a great variety of forms; and the shaping-machine, as it was called, soon became one of the standard tools of the machine-shop. Meanwhile, the old vertical spindle drill, with its compound tables, movable vertically and adjustable horizontally, in two directions at right angles with each other, had been supplemented by the horizontal drill, with similar tables, but with its drill-spindle parallel to the tables; and the further requirements in this direction had been supplied by the radial drill, in which the

MACHINERY MANUFACTURING INDUSTRY

vertical drill-spindle is movable about a vertical axis, to which it is adjustable radially.

However, there were other factors entering into the development of our machinery industry. There were other requirements beside these machine-tools, and which these supplied inadequately. Screw-bolts and nuts were needed for putting the machines together. Originally iron screw-bolts had been made by means of a spit die provided with spiral threads, by rotating either the bolt or the die backwards and forwards until the thread was partly cut, while a taper-tap was screwed into the nut first from one side, then the other, until the bolt was found to fit into the nut. These bolts were not interchangeable. This primitive system of bolt-manufacture continued until 1847, when the solid die with sectional threads patented by Philétus W. Gates, was generally introduced. This die cut the thread at one pass, then the rotation was reversed to unscrew it from the bolt, which marked the thread and was liable to mutilate the die. No compensation for wear was possible. Nothing approaching perfection was attained until 1857, when William Sellers devised a bolt-machine in which dies to cut the thread at one pass, and adjustable to size, could be opened and closed while running continuously in one direction. Since then ordinary screw-bolts have been made interchangeable. In a few years this machine of Sellers' was introduced into England and also continental Europe. The gear-cutter was another of the early machine-shop tools. This was simply a revolving milling-cutter, mounted upon a spindle above the dividing-plate. The wheel to be cut was forced against this. The machine was adjusted by hand. Such work was slow and very expensive; and up to 1867 the teeth of nearly all wheels, even for fine machines, were cast. In this year a machine was devised by William Sellers which limited the work of the operative to adjusting the wheel to be cut to the cutter. The machine was otherwise automatic; and it was now possible for one workman to attend to several machines, thereby greatly diminishing the cost of such work. From that time cast wheels have been no longer allowable in first-class machines. Another typical machine-tool that deserves mention is the milling-machine. It has received its greatest development in this country, where it is used particularly in fashioning shapes in fire-arms.

Such machine-tools constitute the more important part of "metal-working machinery," as distinguished from the general group of "foundry and machine-shop products" in the United States census for 1900. Indeed, prior to that time we have no separate statistics for this branch of industry. At that time there were in the United States 397 establishments, representing an aggregate capital of \$54,293,812, employing 29,436 people, and turning out annually products worth \$44,385,229. While there is no basis for a comparison with former years, it is known that this industry has grown steadily. Ohio and Pennsylvania lead, the former with 68 establishments, representing a capital of \$11,171,334, employing 6,123 people, and turning out products worth \$10,012,739, the latter with 31 establishments, representing a capital of \$11,170,822, employing 4,150, and turning out products worth \$6,989,252. Massachusetts, New York, Connecticut, and Illinois can each show

a greater number of establishments than Pennsylvania, but the aggregate capital and the value of the products of each of these States are smaller than in the Keystone State. Some of the items included in the total of \$44,385,229 are, lathes of all kinds, \$8,330,383; boring and drilling machinery, \$2,779,983; milling-machines, \$2,171,966; planers, \$1,808,955; stamping, flanging, and forming machines, \$1,180,960; slotters and shapers, \$1,136,350, not to mention hammers, forging, riveting, sawing, threading, and polishing machines, etc., etc. This industry has become highly specialized now, and only the older establishments produce a number of different types of machines. New establishments usually make only one type of machine, or at most one class embracing tools of similar type. Some establishments make only engine-lathes, others only planers, others nothing but milling-machines. Cincinnati is the largest producer of this kind of machinery; and, since the industry is comparatively new there, the specialization is also greatest. Though the aggregate products of Philadelphia are less than those of Cincinnati, the Quaker city shows a much greater range in the variety of machinery produced. Other important centres are Providence, Rhode Island, Hartford, Connecticut, and Worcester, Massachusetts, their importance being in the order named. The effect of specialization has been to make machine-tools more efficient, and, it may be added, more varied. If, for instance, a new vehicle is designed, as the bicycle, or the motor-carriage, and strangely fashioned parts are required, a machine that will make these parts is always forthcoming.

The development of more accurate machinery, as indicated above, led to the system of interchangeability. In the manufacture of machinery this is an economic principle of the greatest importance. Under more primitive methods individual parts had to be fitted together with great difficulty and at much expense. Now all these parts are made by machines with such exactness that they are thoroughly interchangeable; and there is no longer any question as to their fitting. This method of manufacture has increased the output of the individual and has reduced the cost of production tremendously. As simple as the system may seem, it was slow in attaining its present perfection. Though first attempted in Europe, it remained for the United States to demonstrate its feasibility and actually put it into successful operation. Following the lead of this country Europe afterward adopted the system. For the economical manufacture of any kind of machinery in which many parts are to be interchangeable certain definite conditions must be met; and success economically requires that every part shall be finished without the intervention of a skilled workman. The machine must be so designed that it will not only work automatically but work with a high degree of accuracy. Reference standards must be provided with which to compare the several parts in order to determine the amount of variation permissible between the standard and the product; every part must come from the machine in the final finished form. Such are some of the details that make necessary a careful study of every part in order to design a machine that will perform each operation with the most efficiency.

The principle of interchangeability was first

MACHINERY MANUFACTURING INDUSTRY

made use of in the United States in the manufacture of fire-arms in our government arsenals under the direction of Eli Whitney, the inventor of the cotton-gin. The growth of the system was slow, being confined for a long time to a few of the principal parts; but even in this undeveloped condition it proved successful economically. In 1822 Calhoun, who was Secretary of War then, remarked to Whitney that his improvements were saving the government \$25,000 a year at the two public armories. By means of the drop forging-press, with dies conforming to the shape desired, Whitney was able to cut from red-hot metal all the smaller parts of a gun in a form closely approximating the finished article. These forged parts were then subjected to the more accurate milling-machine, which turned out the parts in uniform condition, no matter how varied their shape may have been when they came from the forging-press. It only remained for the drill to fashion the bearings for the working parts and bore the holes to secure the parts together. This was a comparatively simple matter when once the order of procedure had been determined and the guiding templates provided. The wooden stocks of the gun were also made by machinery and with sufficient accuracy to make them interchangeable. This was accomplished by means of a turning-lathe designed by Thomas Blanchard and patented by him in 1820. After the stock came from the lathe the groove for the barrel and the cavity for the lock were hollowed out by special machinery. Measured by the standards of to-day all this work was crude; but the gun of that day was itself crude, and these roughly interchangeable parts served their purpose. Machine-tools were then both inaccurate and limited in variety, so that they could not be expected to turn out the various parts with mathematical accuracy. Further, at that time there were no such delicate measuring instruments as we have to-day. The most refined measuring instrument known then was the vernier caliper; and the smallest deviation from the standard that could be detected with this contrivance was, at best, perhaps the thousandth part of an inch. The form of the screw-thread was not even susceptible of determination with any degree of accuracy. Since then has come great developments in the quality of machine-tools and in their wonderful adaptability to changing needs. Measuring instruments have now been so highly developed that a variation of the twenty thousandth part of an inch can be detected immediately and with perfect accuracy. Such delicate measuring appliances were first made by the Pratt & Whitney Company, from designs of Prof. W. A. Rogers and Mr. George M. Bond. The type of screw-threads now employed make possible a degree of accuracy that was undreamed of in the early days of this industry.

Foreign countries did not remain indifferent to the success of the United States in the employment of the principle of interchangeability of parts. Various commissions were appointed to investigate the system; and, as remarked above, the economic success of the United States in producing interchangeable parts led to the adoption of this method in Europe. Other countries had experimented with the plan; but, as in the case of many other things, it remained for American energy and inventive genius to put

the plan into execution. Between 1870 and 1880 our large machinery manufacturers were kept busy filling foreign orders, especially for gun machinery. Large orders for such machinery were received from the German government; and it was even stipulated in the contract that the manufacturers should send over men to set up the machinery and instruct native workmen how to run it. Other governments began to look to us for their machinery; and thus our system for the manufacture of interchangeable parts was gradually established in England and continental Europe. In brief, we have led in the manufacture of this sort of machinery. For more than half a century this country has been in possession of a system of manufacture peculiarly its own. This principle of interchangeability, first applied to the manufacture of the larger class of fire-arms, then to pistols, has now been extended to practically every kind of machine. The sewing-machine, the typewriter, the bicycle, the watch, and the various kinds of agricultural machinery (q.v.) may be mentioned as types showing the economic value of the principle of interchangeability. In all these machines, and others, we lead the world. It seems that all our large machinery manufacturers are represented in foreign countries, and certain types of American typewriters, sewing-machines, cash registers, mowing-machines, reapers, etc., are just as well known there as they are here. American textile machinery and shoe-making machinery play an equally important part. In the manufacture of certain kinds of motor-carriages, as the light steam runabout and the electric carriage, America now leads the world. In general, America has been particularly successful in manufacturing transportation machinery. At the last census there were in the United States twenty-eight establishments whose sole or chief product was locomotives. In 1900 more than 3,000 locomotives were built in this country; and of these 525 were exported, as against 161 in 1890. What was said of the increasing price of machine-tools holds good for locomotives. The demand is for larger and more powerful machines; and, while in 1890 the average price of 2,400 locomotives built in that year was \$8,199, in 1900 the average price had increased to \$9,777. Pennsylvania leads in this branch of machinery. In 1900 the eight locomotive works in this State turned out 44.6 per cent. of the total product. American machinery of all kinds is distinguished for superiority in construction and design; and for this reason the exports are large and the imports small, despite the lower price of foreign machinery.

It is impossible to give statistics for our machinery-manufacturing industry as a whole, since, with a few exceptions, the United States Census does not separate it from foundry and machine-shops in general. While foundries produce much that is not properly machinery, the total figures given by the United States Census for 1900 will give some idea of the magnitude of this industry. At that time the number of machine-shop establishments in the United States was 9,234, with an aggregate capital of \$665,058,245, and giving employment to 350,327 people. See **HARDWARE INDUSTRY; AGRICULTURAL MACHINERY AND IMPLEMENTS**; and articles on special types of machinery.

Machol', or Mahhol' (Hebrew), a word in the Old Testament, associated with "toph" (timbrel), and almost always rendered in the English version by "dances" or "dancing." It is not improbable that *machol* and *toph* may mean "pipe and tabor," as these two instruments are often associated with dancing.

McIlhenney, mäk-il-hën'i, Charles Morgan, American landscape painter: b. Philadelphia 4 April 1858. Having studied under Frank Briscoe, he continued his course of training at the Academy of Fine Arts in Philadelphia, and soon began to win recognition in his chosen field. Among his best known works are 'A Gray Summer Noon' (1884), and 'The Passing Storm' (1887). In 1893 he was awarded medals at the Columbian Exposition and won the first Hallgarten prize.

McIlvaine, Charles Pettit, American Protestant Episcopal bishop: b. Burlington, N. J., 18 Jan. 1799; d. Florence, Italy, 13 March 1873. He was graduated at the College of New Jersey (now Princeton University), in 1816; entered the Princeton Theological Seminary in the same year, and was ordained deacon in 1820 and priest in 1821. His first pastoral charge was at Georgetown, D. C., which he left in 1825 to become professor of ethics at the United States Military Academy, West Point. He became rector of St. Ann's Church, Brooklyn, in 1830, and in 1831 undertook the duties of the professorship of the evidences of religion and sacred antiquities in the University of the City of New York. He did not long hold the chair, however, as he was the next year elected bishop of Ohio, to succeed Bishop Chase, who had resigned the see. The question of the legality of such a resignation excited considerable interest in the General Convention of that year, but in the interest of the diocese both houses agreed in approving Dr. McIlvaine's testimonials, and he was accordingly consecrated in St. Paul's Chapel, New York. Upon his removal to Ohio he was elected president of Kenyon College, Gambier, founded by Bishop Chase, and held the position until 1840, acting also for some years as president of the Theological Seminary in the same place. During his long episcopate he came to be recognized as one of the most influential leaders of the Evangelical or Low Church party in America, and his ability and courtesy were cordially recognized by those who differed from him most widely. During the Civil War he was one of the four ambassadors informally appointed by President Lincoln to set before the English people what was considered in the North the real significance of the War. He published various sermons, addresses, and more important theological works, mainly directed to defending the positions of his party in the Church.

McIntosh, mäk'in-tösh, Lachlan, American soldier: b. near Inverness, Scotland, 17 March 1725; d. Savannah, Ga., 20 Feb. 1806. He came with his father to Georgia in 1736, received there an ordinary English education, became a clerk in the mercantile establishment of Henry Laurens at Charleston, S. C., and was later employed as a land surveyor. At the opening of the Revolution he was made colonel of the 1st Georgia battalion, and became a brigadier-general in 1776. In 1777 he fought a duel with But-

ton Gwinnett (q.v.), who was fatally wounded. In 1778 McIntosh was selected by Washington to lead a small force against the Western Indians, whom he subdued. In the siege of Savannah, 1779, he bore an active part. When Charleston surrendered to Sir Henry Clinton 12 May 1780 McIntosh was taken prisoner, and he never resumed his command. He was a member of the Continental Congress in 1784, and the next year as commissioner to the Indians he finished his public services.

MacIntosh, Maria Jane, American author: b. Sunbury, Ga., 1803; d. Morristown, N. J., 28 Feb. 1878. In 1835 she removed to New York; and having suffered pecuniary reverses resorted to her pen for support, publishing in 1841 'Blind Alice,' under the pseudonym of 'Aunt Kitty,' by which she continued subsequently to be known. It was followed by 'Conquest and Self-Conquest,' 'Praise and Principle,' and other tales between 1841 and 1846, each designed to inculcate some moral sentiment. In 1846 she published a work entitled 'Two Lives, or to Seem and to Be,' and in 1847 her stories were collected in a single volume as 'Aunt Kitty's Tales.' Other works are: 'Charms and Counter-Charms' (1848); 'Donaldson Manor' (1849); 'Woman in America' (1850); 'The Lofty and the Lowly' (1853); 'Violet, or the Cross and the Crown' (1856); 'Meta Gray' (1858); 'Two Pictures' (1863).

McIver, Charles Duncan, American educator: b. Moore County, N. C., 27 Sept. 1860; d. 17 Sept. 1906. He was graduated from the University of North Carolina in 1881, adopted teaching as a profession and after organizing the public schools of Winston and Raleigh, became one of the faculty of Peace Institute, Raleigh, in 1886. He was State Institute conductor, 1889-92, and held important educational posts in his native State, as chairman of the committee of the Teachers' Assembly in 1891 assisting in securing the establishment of the North Carolina Normal and Industrial College. In 1892 he became the first president of this institution, the only college for women in the State receiving an annual appropriation from the public funds. He was a member of the Southern Educational Board, which controls the Peabody Fund.

Mack von Leiberich, mäk fön l'ib'ërits, Karl, BARON, Austrian military officer: b. Nennslingen, Franconia, 24 Aug. 1752; d. Saint Polten, Austria, 22 Oct. 1828. He entered the army of Austria in 1770, and was in 1797 created field-marshal. After the peace of Campo Formio, he was appointed by the King of Naples to the command of his troops, and took the field against the French and occupied Rome; but a riot in Naples, caused by his having concluded an armistice with the French, forced him to take refuge in the French camp. He was carried prisoner to Paris, but escaped in 1800 and in 1805 was sent to check the French advance along the line of the Iller. But the enemy shut him up in Ulm, and on Oct. 17 Mack capitulated with his army. He was tried by court-martial, but the sentence of death was commuted by the Austrian emperor to expulsion from the army and 20 years' imprisonment. In 1808 Mack was liberated, and in 1819 fully pardoned.

Mackay, ma-ka' or ma-ki', Charles, English poet, journalist, and miscellaneous writer: b. Perth, Scotland, 27 March 1814; d. London

24 Dec. 1889. He was editor of the 'Illustrated London News,' 1852-9, lectured in the United States, 1857-8, and was a special correspondent of the *London Times* in New York during the Civil War (1862-5). He was famous for his songs, many of which he set to music of his own. 'Cheer, Boys, Cheer,' is the best known of these. Among his many books are: 'The Salamandrine, or Love and Immortality' (1842); 'Voices from the Crowd' (1846); 'Voices from the Mountains' (1847); 'History of the Mormons' (1851); 'Lost Beauties of the English Language' (1874); 'Forty Years' Recollections' (1878); 'Through the Long Day' (1887); 'A Dictionary of Lowland Scotch' (1888).

Mackay, Clarence Hungerford, American capitalist: b. San Francisco 17 April 1874. The son of J. W. Mackay (q.v.), he succeeded on the death of his father to his vast business interests. Much of his boyhood was spent in France, and he was educated at Vaugirard College, afterward studying at Beaumont College, Windsor, England. He became proficient in modern languages, several of which he speaks fluently.

McKay, Donald, American shipbuilder: b. Nova Scotia 1810; d. 1880. He went to New York and learned ship-building, and began the business at Newburyport, Mass. At East Boston, in 1845, he established a shipyard where he built many large trading ships of the clipper model, in which he made great improvements. The Great Republic, which he built, a ship of 4,500 tonnage, was a larger vessel than had ever before been seen.

Mackay, George Eric, English poet, son of Charles Mackay (q.v.): b. London 25 Jan. 1851; d. 2 June 1898. Among his works are: 'Songs of Love and Death' (1865); 'Ad Regimam' (1881); the popular 'Love Letters of a Violinist' (1886); 'A Lover's Litanies' (1888); 'Nero and Actæa,' a tragedy (1891); 'My Lady of Dreams' (1895); 'Arrows of Song' (3d ed. 1896); 'A Lover's Missal' (1898).

McKay, Gordon, American inventor and manufacturer: b. Pittsfield, Mass., 1821; d. Newport, R. I., 19 Oct. 1903. He was the son of a cotton manufacturer, and at 12, on the death of his father, learned civil engineering, at which he worked for some time. Before he was 21 he built a machine-shop in Pittsfield which employed 100 men, and later became treasurer and manager of the Lawrence Machine Company. He was the first successful inventor of machinery for making boots and shoes; he perfected a shoe sewing-machine, invented, but not made practicable, by L. R. Blake, of Abington, Mass.; afterward invented the heeler, lasting-machine, nailing-machine, etc., which came into general use; and by these inventions revolutionized the boot and shoe industry of the world. At the outbreak of the Civil War he offered to make the shoes for the Union army, and within three years had leased his machines to more than 60 firms, and shortly became a millionaire. In 1878 he formed the McKay Sewing-Machine Association, a strict monopoly which exacted commissions on all shoes made in the United States by the aid of his inventions, and also brought profit through European royalties. In 1893 he placed \$4,000,000 in a trust fund for Harvard University. He made many other liberal donations for benevolent and educational

objects, and established near Kingston, R. I., the McKay Institute for the manual training of colored youth. By his will the greater part of his estate was left to Harvard.

Mackay, John William, American capitalist: b. Dublin, Ireland, 28 Nov. 1831; d. London 20 July 1902. His parents brought him to New York in 1840, and he learned ship-building. He went to California as a miner in 1851, and afterward to Nevada, where he continued mining with great perseverance in the face of many disappointments. In 1872 he was one of the discoverers of the Bonanza mines of the Comstock Lode (q.v.), in which mines he obtained a two fifths share, and became very wealthy. He and his partners, Fair, Flood, and O'Brien, founded the Bank of Nevada, of which Mackay was president for years. His relations with Jay Gould being unfriendly, in a spirit of opposition to him, and to the Western Union Telegraph Company, Mackay in 1884 joined with James Gordon Bennett in forming the Commercial Cable Company and the Postal Telegraph Company. He succeeded in laying two cables, overcoming great obstacles, and afterward won in a long rate-war with the old lines. The Roman Catholic Orphan Asylum at Virginia City, Nev., founded by him, is noteworthy among his many public benefactions.

Mackay-Smith, Alexander, American Protestant Episcopal bishop: b. New Haven, Conn., 2 June 1850. He was graduated from Trinity College, Hartford, in 1872, entered the Episcopal ministry and took priest's orders in 1877. After holding rectorships in South Boston, Mass., and New York successively, he was rector of St. John's, Washington, D. C., 1893-1902. In the year last named he was consecrated coadjutor-bishop of Pennsylvania.

Mackaye, ma-kā', James Steele, American playwright: b. Buffalo, N. Y., 1844; d. Timpas, Colo., 25 Feb. 1894. In 1868 he went to Paris to study painting; but having there met Delisarte (q.v.) became interested in the latter's theories, and studied dramatic expression. In 1870-1 he gave in New York and Boston lectures on the art of expression. He opened the St. James Theatre at New York in 1872, and appeared there in 'Monaldi,' adapted by himself from the French. In 1873-5 he was studying the drama in Paris and England, and at the Crystal Palace, London, he played the title-role in 'Hamlet.' His adaptation of Blum's 'Rose Michel' in 1872 ran for 122 nights at the Union Square Theatre, New York. He established in New York the Lyceum School of Acting, which later became the American Academy of Dramatic Arts. For several years he was manager of the Madison Square theatre, and in 1885 built the Lyceum. Among his further plays were: 'Won at Last'; 'Through the Dark'; 'Hazel Kirke'; 'A Fool's Errand'; 'In Spite of All'; 'Paul Kauvar.'

McKean, ma-kēn', Thomas, American patriot and jurist, signer of the Declaration of Independence: b. New London, Chester County, Pa., 19 March 1734; d. Philadelphia 24 June 1817. He was privately educated at Newcastle, Del.; having settled there, he studied law and was admitted to the bar in 1755; at once became register of probate, and was soon made assistant attorney for Sussex County. With Caesar Rodney (q.v.), in 1762, he entered upon

a revision of Delaware laws up to 1752, and was chosen in the same year to the Delaware Assembly, in which his membership continued till 1779. Elected in 1765 to the Stamp Act Congress (see STAMP ACT), he took a strong position in defense of colonial rights, and as judge of the common pleas in the same year permitted no stamped paper to be used in his court. About 1771 he began to practise law in Philadelphia, although retaining a Delaware residence, and from Delaware, in 1774, he was elected to the Continental Congress, in which he served nine years, including the entire period of the Revolution, and took a prominent part in its proceedings, being president of the Congress in 1781. He was not present at the signing of the Declaration of Independence, which he had advocated, but added his signature some years afterward. The Articles of Confederation, which he aided in drafting, were also signed by him. In Pennsylvania, where he had become well known, he was made chairman of the Committee of Safety in 1776, and from 1777 to 1799 was chief justice of the State. He became a strong supporter of Jefferson, and a leader of the Republican party of that day, and was governor of Pennsylvania from 1779 to 1808. With James Wilson he wrote 'Commentaries on the Constitution of the United States' (1790).

McKean, Thomas, American philanthropist: b. Philadelphia, Pa., 23 Nov. 1842; d. there 16 March 1898. In 1862 he was graduated at the University of Pennsylvania and entered upon a successful business career, becoming an officer in many railroad and financial corporations. He acquired a large fortune, which he spent freely in endowing educational and charitable enterprises, his various gifts to the University of Pennsylvania alone amounting to \$300,000.

McKean, William Vincent, American editor: b. Philadelphia 15 Oct. 1820; d. there 29 March 1903. He was a type-founder's apprentice in 1836-46, held a government post in Philadelphia in 1846-50, studied law and was associate of John W. Forney (q.v.) in the editorship of 'The Pennsylvanian' in 1850-3. In 1853-6 he was chief-clerk and disbursing officer of the House of Representatives, and became secretary to James Buchanan. He was editor-in-chief of the Philadelphia *Inquirer* 1860-4, and from 1864 until 1891 editor-in-chief and general manager of the *Public Ledger*.

McKees (ma-kēz') **Rocks**, Pa., borough, in Allegheny County; on the Ohio River, and on the Pittsburg, C. & Y., and the Pittsburg & L. E. R.R.'s; opposite the city of Allegheny. The first permanent settlement was made about 1830 by John McKee. It was incorporated as a borough in 1892. It is situated in a bituminous coal region, and in the vicinity of a fertile agricultural section. The chief industrial establishments are railroad shops, iron and steel works, car works, wire mills, tannery, chain works, rolling-mills, glassworks, flour and lumber mills. The shops and mills employ about 5,500 men. The borough has nine churches, four public and two parish schools. The principal public buildings are the churches, schools, a Y. M. C. A. building, and a hospital. There are three banks having a combined capital of \$325,000; and the

business transacted amounts annually to over \$1,000,000. The government is vested in a burgess and a council of seven members. There are a number of foreign-born inhabitants, chiefly Germans, Hungarians, Italians, and Russians; the native born predominate. Pop. (1890) 1,687; (1900) 6,352. A large number of the employees in the machine shops and steel works reside outside the borough limits.

JOHN E. SCHRAMM,
Editor *McKees Rocks* 'Gazette.'

McKeesport, Pa., city, in Allegheny County; at the junction of the Monongahela and the Youghiogheny rivers, and on the Pennsylvania, the Pittsburg & L. E., and the Baltimore & O. R.R.'s; about 10 miles southeast of Pittsburg. The first permanent settlement was made in 1795 by David McKee, after whom the place was named. It was only a small village until 1829, when coal mining began on an extensive scale. It was incorporated as a borough 3 Sept. 1842, and chartered as a city 1 April 1890.

McKeesport is situated in a region noted for its extensive fields of bituminous coal and its natural gas. The chief industrial establishments are steel and iron works, one of which, the National Tube Company, has 10,000 employees. There are about a dozen smaller establishments; railroad shops, glass works, locomotive works, and others, all together employing about 8,000 men. The city has a large trade in its own manufactures and in coal and lumber. The principal educational institutions are the public and parish schools, the Douglass Industrial College, the Gessley Business College, and the Carnegie Library. Some of its principal buildings are those of the schools mentioned (the high school cost about \$168,000), the Young Men's Christian Association Hall, and 30 churches. There are 18 different religious denominations and 40 congregations in the city.

There are five banks, the combined capital of which is \$1,100,000. The city officials are a mayor, who holds office three years, a council composed of 11 select and 22 common council members. The select members hold office four years, the common council members are elected every two years. The mayor appoints, subject to approval of the council, the board of health, the police and the street commissioners. The council elect the chief of the fire department, the water commissioners, and the city solicitor, and the board of education, the board of assessors, the treasurer, and comptroller are chosen by popular election.

The city owns and operates the waterworks. The annual municipal expenditures are about \$320,000; the chief items of expense are, for schools about \$155,000; waterworks, \$55,000; police department, \$55,000; fire department, \$35,000. Pop. (1890) 20,741; (1900) 34,227. A large number of the people are foreign born, chiefly from Austria, Sweden, Germany, and Italy; but the native born predominate.

A. N. LAWSON,
Managing Editor 'Daily News.'

MacKellar, ma-kē'l'ar, **Thomas**, American poet: b. New York 12 Aug. 1812; d. 29 Dec. 1899. Having learned the printer's trade in the publishing house of the Harpers, he went to Philadelphia as a proofreader in the stereotype foundry of Lawrence Johnson & Co., in time became a partner in the business, and finally its

head, the new firm being styled MacKellar, Smiths & Jordan. Among his works may be mentioned: 'Droppings from the Heart' (1844); 'Tam's Fortnight Ramble' (1847); 'The American Printer' (1866); 'Rhymes Atween-Times,' containing 'Let Me Kiss Him for His Mother' (1873); and 'Hymns and Metrical Psalms' (1883).

McKelway, Saint Clair, American journalist: b. Columbia, Mo., 15 March 1845. In 1853 he came east and was educated in New Jersey, studied law and was admitted to the bar in New York in 1866, but never practiced. In 1868 he became Washington correspondent for the New York *World* and the Brooklyn *Daily Eagle*, and in 1870 a member of the editorial staff of the latter paper. From 1877 to '84 he was the editor of the Albany *Argus*, and in the latter year returned to Brooklyn to become editor-in-chief of the *Eagle*, which under his editorship maintained a high standard of excellence. He has been a regent of the University of the State of New York since 1883, a member of the historical societies of Long Island and Suffolk County, is director of the American Social Science Association; and lectures frequently on educational and political subjects.

McKendree, ma-kén'dri, William, American Methodist bishop: b. King William County, Va., 6 July 1757; d. near Nashville, Tenn., 5 March 1835. He served in the Continental army during the American Revolution, entered the Methodist ministry in 1787 and became a presiding elder nine years later. In 1801 he made a missionary tour beyond the Alleghanies and was an important factor in the evangelizing of that region. In 1808 he was elected bishop, being the first American born person to hold that office in the Methodist church. McKendree College (q.v.) was named in his honor. Consult 'Life' by Paine (1869).

McKendree College, in Lebanon, Ill., founded in 1828 under the auspices of the Methodist Episcopal Church, and first called Lebanon Seminary. In 1830 the name was changed, in honor of William McKendree, who gave his estate to the college. In 1839 a new charter was obtained whereby the school was granted university privileges. Abraham Lincoln rendered valuable services in securing the new charter. Students are admitted on certificates from approved schools or on examinations. It has classical, scientific, music, law, and graduate departments. The degrees to which the courses lead are A.B. and B.S. In 1903 there were connected with the school 12 professors, and 150 students in the academic and college departments, and 80 students in music. The library contained about 12,000 volumes. The endowment fund was about \$50,000, and the annual income \$6,500. The estimated value of the college grounds and buildings was nearly \$70,000.

McKenna, ma-kén'a, Joseph, American jurist: b. Philadelphia 10 Aug. 1843. In 1855 he went to California and was graduated from the Benicia Collegiate Institute in 1865, and admitted to the bar the same year. He was district attorney of Solano County in 1866-8, and in the sessions of 1875 and 1876 served as a Republican in the lower house of the California legislature. In 1885-93 he was a California representative in the 49th, 50th, 51st and 52d Con-

gresses, resigning from the House in 1893 to accept the appointment to the office of United States circuit judge in the 9th Federal judicial district. This post he resigned to become attorney-general in the cabinet of President McKinley in 1897. On 16 Dec. 1897 he was made an associate justice of the United States Supreme Court to succeed Justice Field, retired, and on 26 Jan. 1898 took his seat. As circuit judge at San Francisco McKenna displayed much skill in the exposition of international law and the construing of treaties.

Mackenzie, ma-kén'zi, Sir Alexander, Scottish explorer: b. Inverness, Scotland, 1755; d. near Dunkeld 12 March 1820. He went to Canada when young, where he entered the employ of the Northwest Fur Company. In 1789 he explored the great river named after him from the western end of Great Slave Lake to the Arctic Ocean, made another expedition to the western coast (1792), and was the first white man to cross the Rocky Mountains and reach the Pacific coast. He returned to Britain in 1801, and for his explorations received the honor of knighthood in 1802. He published 'Voyages from Montreal through the Continent of North America to the Frozen and Pacific Oceans in 1789 and 1793.'

Mackenzie, Alexander, Canadian statesman: b. Logierait, Perthshire, Scotland, 28 Jan. 1822; d. Toronto, Ontario, 17 April 1892. He emigrated to Canada in 1842. For five years he worked at the trade of a stonemason at Kingston, but then removed to Sarnia, where he became a contractor. But his chief interests were commercial, not political. In 1852 he began the Lambton 'Shield,' and soon became conspicuous as one of the Liberal leaders. He entered the Canadian Parliament in 1861, and after the Confederation of Canada, in 1867, sat both in the Ontario legislature at Toronto and in the Dominion Parliament at Ottawa. When the Hon. Edward Blake (q.v.) became prime minister of Ontario, in 1871, Mackenzie joined his cabinet, and became provincial treasurer, but, in consequence of a law forbidding membership of more than one legislature, he elected in 1872 to sit in the Dominion Parliament. In 1873, when the government of Sir John Macdonald was overthrown, Mackenzie, now the leader of the Liberal party, became prime minister of Canada, and held office for five years. His administration of public affairs was marked by rigid integrity. He himself took the great spending department of public works, and contractors found in him a vigilant watchdog of the treasury. His too great devotion to the details of his office broke down his health. In 1878 his government was defeated by the advocates of protection, and in 1880 he was obliged by ill-health to hand over the leadership of the Liberal party to Mr. Blake. Though he remained in Parliament for some years, he was never again able to take a prominent part in public affairs.

GEORGE M. WRONG,
Professor of History, University of Toronto.

Mackenzie, Alexander Slidell (originally Slidell), American naval officer: b. New York 6 April 1803; d. Tarrytown, N. Y., 13 Sept. 1848. He was a brother of John Slidell (q.v.) and assumed the name 'Mackenzie' for an uncle

in 1837. He entered the navy in 1815 and became a commander in 1841. While in command of the Somers the next year a mutiny among the naval apprentices on board was supposed to have been detected, and three of them, including a son of the secretary of war, were hung from the yardarm on 1 Dec. 1842. He was a popular writer, and among his works are: 'A Year in Spain by a Young American' (1829-1831; enlarged ed. 1836), which attained great popularity in England and the United States; 'Popular Essays on Naval Subjects' (1833); 'The American in England' (1835); 'Life of John Paul Jones' (1841); etc.

Mackenzie, Henry, Scottish novelist and essayist: b. Edinburgh 25 Aug. 1745; d. there 14 Jan. 1831. He was a lawyer at Edinburgh; and in 1771 published anonymously 'The Man of Feeling' (1771), which gained him a conspicuous place among 18th century writers. Other novels of his are 'Man of the World' (1773); and 'Julia de Roubigné' (1777). He edited 'The Mirror' 1779-80, and 'The Lounger' 1785-87, papers on the plan of 'The Spectator'.

Mackenzie, Sir Morell, English laryngologist: b. Leytonstone, Essex, 7 July 1837; d. London 3 Feb. 1892. He was educated at the London Medical College, Paris and Vienna. In 1859 he met Czermak in Budapest and learning from him the use of the laryngoscope he introduced its use into London. Later he became physician to the London Hospital, and lecturer on diseases of the throat. In 1863 he founded the Throat Hospital in London. In 1887-8 he was associated with specialists of Berlin and Vienna in the treatment of the larynx disease of the Crown Prince, subsequently Emperor Frederick of Germany, and for these services was knighted by Queen Victoria, and received the Grand Cross and Star of the Hohenzollern Order of Germany. He was the author of 'The Use of the Laryngoscope' (1866); 'Diseases of the Throat and Nose' (1880); etc.

Mackenzie, Ranald Slidell, American soldier: b. Westchester County, N. Y., 27 July 1840; d. Staten Island, N. Y., 19 Jan. 1889. He was son of Alexander S. Mackenzie (q.v.). Graduated from West Point in 1862, he was assigned to the engineer corps, was wounded at Manassas and brevetted 1st lieutenant for services in that action. He was engineer of Sumner's division at Fredericksburg (13 Dec. 1862), and received the successive brevets of captain and major for his conduct at Chancellorsville and Gettysburg. Promoted captain of engineers 6 Nov. 1863, he took part in the Richmond campaign as commander of the 2d Connecticut artillery. On 18 June 1864 was brevetted lieutenant-colonel for services in the Petersburg siege, and commanded the 2d Connecticut heavy artillery in the Shenandoah campaign. He was present at Lee's surrender at Appomattox (9 April 1865), and was mustered out of the volunteer service 15 Jan. 1866. In 1882 he was made brigadier-general, and in 1884 placed on the retired list.

Mackenzie, William, Canadian financier: b. Kirkfield, Ont., 1848. He was educated at the local schools and became a public school teacher. Giving up this occupation he contracted for the construction of a portion of the Victoria

Railway—now the Midland Division of the Grand Trunk Railway—and later executed contracts for the Coboconk, the Credit Valley, the Canadian Pacific, the Fort McLeod & Edmonton, the Regina, the Hudson's Bay and Dauphin Railways and other roads. He controls and is president of the Toronto Street Railway, is also interested in the Montreal and Winnipeg street railways, and with others controls the Birmingham Street Railway and other European lines. His great achievement has been the construction of the various lines forming the Canadian Northern Railway (q.v.) of which he is president.

Mackenzie, William Douglas, American Congregational clergyman; b. Fauresmith, Orange River Colony, South Africa, 16 July 1859. He was graduated from Edinburgh University in 1881, studied divinity in Edinburgh and Göttingen and is now professor of theology in the Chicago Theological Seminary. He has published 'Ethics of Gambling' (1893); 'The Revelation of the Christ' (1896); 'Christianity and the Progress of Man' (1897); 'South Africa: its History, Heroes and Wars' (1900).

Mackenzie, William Lyon, Canadian journalist and political reformer: b. Dundee, Forfarshire, Scotland, 12 March 1795; d. Toronto 28 Aug. 1861. In 1820 he came to Canada, and conducted a drug and book store at Little York (now Toronto), and later at Queenstown, where in 1824-6 he published the 'Colonial Advocate.' He transferred the 'Advocate' office to Toronto in 1826, and there continued the paper until 1833, attacking the office-holding class and demanding governmental reforms. In 1828 he entered the provincial parliament; and having been expelled for alleged libel against that assembly, was five times re-elected and as often re-expelled, until the government refused to issue another writ of election. In 1832 he went to England, and having presented to the home government a petition of grievances from the Canadian reformers, was successful in obtaining the dismissal of the attorney-general and the solicitor-general of Upper Canada and the veto of the Upper Canadian bank bill. In 1834 he was elected first mayor of Toronto, in 1836 began the publication of 'The Constitution,' and, in 1837 published in that journal a bold manifesto which was practically a declaration of independence of the provincial government. Soon afterward he undertook armed rebellion. An encounter took place between his followers and the government forces at Montgomery's hill, in the vicinity of Toronto (7 Dec. 1837), and the insurgents fled to Navy Island in the Niagara, where they were joined by about 500 Americans. The island was bombarded by Canadian royalists, and as a result of this and the strong opposition of General Scott of the United States army, the insurgents broke camp and Mackenzie was imprisoned for a year in Rochester jail. Later he was a journalist in the United States, in 1849 took advantage of the amnesty to return to Canada, was there a member of parliament in 1850-8, and at Toronto published the weekly 'Mackenzie's Messenger' from 1858 until shortly before his death. The reforms for which he so persistently contended have since been achieved. He wrote: 'Sketches of Canada

and the United States' (1833). Consult the 'Life' by Lindsey (1862); Dent, 'Story of the Upper Canadian Rebellion' (1885); Read, 'The Canadian Rebellion of 1837' (1896).

Mackenzie, Canada, a district in the Northwest Territories, bounded north by the Arctic Ocean, east by Keewatin, south by Athabasca, and separated on the west from Yukon, by the northernmost spur of the Rocky Mountains. The district created in 1895 and administered by the government of the Northwest Territories, is the largest in Canada, having an estimated area of 563,200 square miles, of which 82,000 square miles are water. The surface generally is diversified; in the northwest it is a sterile waste; along the river valleys and on the western mountain slopes it is well forested with fir, pine, spruce, and other northern trees, while coal and other minerals, although unexploited, are found. The chief rivers are the Mackenzie, the Coppermine, and the Great Fish or Black River (q.v.). The soil is comparatively unproductive, the climate being arctic and inhospitable except for the few summer months. The population (1901) 5,216, inhabit the trading settlements of the Hudson's Bay Company, along the Mackenzie and its tributaries. The pelts of the fur-bearing animals of the region are practically the only developed item of commerce.

Mackenzie River, Canada, a large river in the Northwest Territories, which flows from the Great Slave Lake, and after a northwesterly course of about 1,000 miles, enters the Arctic Ocean by numerous mouths at the island-studded Mackenzie Bay. Its tributary head-streams are the Great Peace River, which rises in British Columbia beyond the Rocky Mountains, and the Athabasca or Elk River, which has its source in the Rockies; these two rivers flowing into Lake Athabasca are discharged by the Great Slave River into Great Slave Lake, whence issues the Mackenzie. The principal affluent of the Mackenzie is the Liard or Mountain River. With the exception of a slight obstruction in the rapids near Fort Good Hope, in lat. 66° N., the Mackenzie and its tributaries are navigable for a distance of over 1,800 miles, and from June to October steamboats of the Hudson's Bay Company ply from Great Slave Lake almost to the Arctic Ocean. Forts Providence, Norman, and Good Hope are trading stations along its banks, while Forts McPherson, Franklin, Enterprise, Reliance, Resolution, Chippewyan, Nelson, and Graham are along its tributaries. The valley is well-wooded with spruce, pine, poplar, and birch, while coal, salt and other minerals abound in the region. The river is named after Alexander Mackenzie (q.v.), who first explored it in 1789.

Mackerel, māk'ē-rēl. The common mackerel (*Scomber scombrus*) is the best known and most important member of the family *Scombridae* and one of the most valuable of food-fishes, ranking in this respect behind the cod and herrings only. The mackerel is a compactly built fish of smooth and regular outline, the fusiform figure tapering accurately to the pointed snout, so that it cleaves the water easily. The large, deeply-forked tail is supported on a slender peduncle, provided with two small keels on each side, and preceded by a dorsal and a ventral series of finlets of five each. A soft dorsal

and a counterpart anal fin are placed exactly opposite each other and behind the level of the vent, and the anterior dorsal fin is supported by usually 11 delicate spines. Very numerous and small scales cover the body nearly uniformly, but are absent from the head. The large mouth is provided with numerous small sharp teeth. The gill-rakers are long and the air-bladder is wanting. The color of the back is deep blue, marked by about 35 nearly vertical wavy black lines; below, the fish is silvery white. A recent close study of the species on the European side of the Atlantic establishes the existence there of local races, as in the herring, but it appears that the American representatives, while constituting a race distinct from the European, are more homogeneous.

The mackerel is an abundant fish on both sides of the North Atlantic, on the American side ranging from Cape Hatteras to the Straits of Belle Isle, and on the European from northern Norway to the Canary Islands and throughout the Mediterranean. While a true pelagic fish of wandering and migratory habits and, like most such, capricious in its movements, the great body of mackerel approaches the American coast and moves along it northward as the temperature of the water rises to about 45° F. On the approach of winter they retire to a greater distance from the land, but a few remain throughout the year near the coast. Mackerel swim in great schools at or near the surface; one such covering an area of 10 square miles, and another estimated as containing 1,000,000 barrels, have been observed. The local movements of the schools are largely regulated by the food-supply, which consists of small pelagic fishes, various kinds of small crustaceans, etc., which are pursued with great eagerness. On the other hand, the bluefish and other carnivorous fishes, porpoises, squids and fish-eating birds, are relentless enemies. Spawning takes place in the open sea, not far from the coast, from Vineyard Sound to the Gulf of St. Lawrence, and during the months of May, June and early July. The eggs are about one millimetre in diameter, contain an oil-drop and float at the surface, where the young fish develop and live. They grow rapidly and are about five inches long by the end of the first half year, when they are known as "spikes"; "blinkers" are about one year old and six or seven inches long; "tinkers" are seven to nine inches long and are supposed to be two years old. At the age of three or four years the mackerel is mature and from 12 to 18 inches long. The very largest specimens weigh about four pounds and have a length of 22 to 23 inches.

The mackerel fishery is of the greatest importance in the New England States and Nova Scotia, and in Norway, Ireland and Great Britain. In Europe the fishery is prosecuted almost exclusively by means of small boats and hand lines, but in America is chiefly carried on in staunch sea-going schooners, most of which hail from Gloucester, Mass., and which are equipped with purse-seines, by means of which entire schools are surrounded and captured. The fishing begins off Cape Hatteras in March or April and the schools are followed northward as they appear successively on the New Jersey, New England and Canadian coasts. In addition to the operations of this mackerel fleet, local fisheries are carried on along much of the coast

MACKEREL SHARK — McKIM

with pound-nets, gill-nets and hand-lines. The spring and local catches are generally sold fresh, the summer catch being split and salted. The product of the fishery has been peculiarly subject to fluctuations, due in large part to alternating periods of abundance and scarcity of the fish. Colonial writers refer to its great plenty, and statistics of the catch inspected in Massachusetts show a somewhat regular recurrence of such periods at intervals of about 20 years. From 350,000 barrels in 1880 and 395,000 in 1881, the catch has steadily declined to 75,000 in 1886, and 18,000 in 1891, since which time it has sometimes been larger, sometimes smaller, but an abundance of young fish and other signs may indicate the approach of another period of plenty. The number of vessels employed in 1903 was about 250, or less than one fourth what it formerly was. In 1901 the total value of the mackerel, both fresh and salted, landed at Gloucester and Boston, was \$713,100.

An elaborate account of the American mackerel fishery will be found in Brown-Good's 'Materials for a History of the Mackerel Fishery,' Report U. S. Fish Com. (1884); for some recent views see Moore, 'Report National Fishery Congress' (Washington, 1898); and for methods of preservation, Stevenson, 'The Preservation of Fishery Products for Food,' Bull. U. S. Fish Com. (1898).

Mackerel Shark, or Porbeagle, a shark of the family *Lamnida*, allied to the man-eater (q.v.), and like it sometimes called blue shark, on account of its color, which is frequently seen on both sides of the northern Atlantic Ocean; it is the *Lamna cornubica* of ichthyologists. The ordinary length is about 10 feet, and they become very abundant in summer, when the mackerel are running, along the New England coast, and also about Great Britain, where they are called porbeagles. They are a nuisance to fishermen by destroying their nets, through which several will often tear their way (for they roam about in bands) in pursuit of captured fish. Formerly considerable quantities of oil were saved from their livers, but at present the value of this commodity does not pay for the trouble of taking them.

Mack'ey, Albert Gallatin, American writer on Freemasonry: b. Charleston, S. C., 12 March 1807; d. Fortress Monroe, Va., 20 June 1881. He was graduated from the Medical College of South Carolina in 1832 and was demonstrator of anatomy there in 1838, but after 1844 devoted himself to studies of Freemasonry and became a standard authority on the subject. Among his works are: 'A Lexicon of Freemasonry' (1845); 'The Mystic Tie' (1849); 'Book of the Chapter' (1858); 'A Manual of the Lodge' (1862); 'A Text-Book of Masonic Jurisprudence' (1869); 'Encyclopædia of Freemasonry' (1874).

McKibbin, ma-kīb'in, Chambers, American soldier: b. Pittsburg, Pa., 2 Nov. 1841. He enlisted as a private in the volunteer service 22 Sept. 1862, was brevetted captain for gallant services in the battle of North Anna River (Va.) and in the operations on the Weldon railway, and on 1 May 1896 attained the rank of lieutenant-colonel of the 21st United States infantry. At the beginning of the war with Spain he went to Cuba with Shafter's army, fought at Santiago (1 July 1898), and was made briga-

dier-general of volunteers and appointed military governor of Santiago. On 12 May 1899 he was mustered out of the volunteer service, and on 6 June 1899 assumed command of the department of Texas with rank of colonel of infantry (commissioned colonel 12th United States infantry 1 April 1899).

Mackie, Pauline Bradford. See HOPKINS, PAULINE BRADFORD.

McKim, ma-kim', Charles Follen, American architect: b. Chester County, Pa., 24 Aug. 1847. He studied at the Lawrence Scientific School in 1866, at the Beaux-Arts of Paris in 1867-70, and shortly afterward entered into partnership with Stanford White and William R. Meade. This firm became known in connection with some of the finest triumphs of recent American architecture. Among notable examples of its work are the buildings of Columbia University, and the Public Library of Boston. In 1903 McKim received the royal gold medal from the Royal Institute of British Architects in recognition of his services to architecture. He is the second American to obtain this honor, R. M. Hunt (q.v.) having been the first. On the occasion of the presentation he made an able speech reviewing the progress of his profession in the United States. He was elected president of the American Institute of Architects.

McKim, James Miller, American abolitionist: b. near Carlisle, Pa., 14 Nov. 1810; d. Llewellyn Park, West Orange, N. J., 13 June 1874. He was graduated from Dickinson College (Carlisle, Pa.) in 1828, studied medicine at the University of Pennsylvania and theology at Princeton (1831) and Andover (1832), and in 1835 was ordained a Presbyterian pastor in Womelsdorf, Pa. An original member of the American Anti-Slavery Society, he became its lecturing agent in October 1836, and spoke throughout Pennsylvania, often at great personal danger. In 1840 he removed to Philadelphia, where he was publishing agent of the Pennsylvania Anti-Slavery Society and later corresponding secretary until 1862. In November 1862 he called a public meeting in Philadelphia to provide for 10,000 slaves suddenly liberated by the capture of Port Royal, S. C. As a result, the Philadelphia Port Royal relief committee was formed. This committee was expanded in November 1863 into the Pennsylvania Freedman's Relief Association, of which McKim became the corresponding secretary. In that capacity he was active in the establishment of negro schools in the South. In 1865-9 he was corresponding secretary of the American Freedman's Commission, which on his motion was disbanded in July 1869. In 1865 he assisted in founding and became a proprietor of the New York weekly 'Nation.' During the Civil War he was an advocate of the enlistment of negro troops, and as a member of the Union League of Philadelphia assisted in the recruiting of 11 colored regiments.

Mackinac (măk'i-năk or măk'i-nă) Island, Mich., in Mackinac County, at the entrance to Straits of Mackinac, in the northwest part of Lake Huron; about 255 miles north by west of Detroit. The island is about three miles long and two wide. It is rocky, and covered with trees, shrubs, and flowers. The island has been prominent since the early missionaries and explorers mentioned it in connection with its com-

MACKINAC ISLAND — MCKINLEY

mand of the channel entering the Straits. The city of Mackinac on the southeast shore was chartered in 1900. Pop. of the city (1900) 665.

Mackinder, Halford John, English author and educator: b. Gainsborough, 15 Feb. 1861. He was educated at Epsom College, Christ Church, Oxford; in 1883 was president of the Oxford Union Society; Burdett Coutts University Scholar 1884; barrister, Inner Temple 1886; Reader in Geography Oxford University 1887-1905; and since 1903 has been a Senator of London University and Director of the London School of Economics and Political Science. He was president of the Geographical Section, British Association 1895; leader of the Mount Kenya Expedition 1899; contested Warwick (Liberal) 1900; Officer de l'Instruction Publique de France 1901; corresponding member Berlin Geographical Society 1903; and medalist Royal Scottish Geographical Society 1903. He has written: (with Sadler) 'University Extension, Past, Present and Future' (1891); 'Britain and the British Seas' (1902); etc.

McKinley, ma-kín'li, William, American statesman, 25th President of the United States: b. Niles, Trumbull County, Ohio, 29 Jan. 1843; d. Buffalo, N. Y., 14 Sept. 1901. He was educated at Union Seminary, Poland, Mahoning County, Ohio, and Allegheny College (Meadville, Pa.) (1860-1), was forced by illness to discontinue his college course, taught in the public schools, was a clerk in the Poland post-office, and on 11 June 1861 enlisted for the Civil War as a private in company E of the 23d Ohio volunteer infantry. His first battle was that of Carnifex Ferry (10 Sept. 1861), and on 15 April 1862, while in camp at Fayetteville, western Virginia, he was promoted commissary sergeant. For conspicuous service at Antietam (17 Sept. 1862) he was made 2d lieutenant of company D. His subsequent appointments were, 1st lieutenant company E (7 Feb. 1863), captain company G (25 July 1864), and brevet major (14 March 1865). When mustered out on 26 July 1865 he was acting assistant adjutant-general on the staff of General S. C. Carroll, commanding the veteran reserve-corps stationed at Washington. Among other actions in which he participated were those of South Mountain (14 Sept. 1862), Lexington (10 June 1864), Kernstown (24 July 1864), Opequan Creek (Winchester) (19 Sept. 1864), Fisher's Hill (22 Sept. 1864), and Cedar Creek (19 Oct. 1864). During his subsequent political career he was generally known, especially in Ohio, as Major McKinley. At the close of the war he began the study of law at Youngstown, Ohio (1865-6), continued it at Albany (N. Y.) law school (1866-7), in March 1867 was admitted to the bar at Warren, Trumbull County, Ohio, and at once entered practice at Canton. In 1870-1 he was prosecuting attorney of Stark County, and during the campaign between R. B. Hayes and William Allen for the governorship of the State, spoke effectively against the "greenback" craze. He was elected to Congress as Republican representative from the 17th Ohio district in 1877, and served continuously in the 45th, 46th and 47th Congresses (1877-83). It was asserted by the Republicans that he was elected in 1882 to the 48th Congress by a majority of eight ballots; but, although he had received the certificate

of election, his seat was successfully contested by J. H. Wallace, who was not, however, seated until June 1884. He represented the 20th district in the 49th Congress (1885-7), and the 18th in the 50th and 51st Congresses; but in 1890 was defeated in the 16th for the 52d Congress by 300 ballots by J. G. Warwick, Democrat, lieutenant-governor of the State a short time previously. His defeat was attributed to the gerrymandering of the district by a Democratic legislature. His service in Congress was notable. In 1877 he was appointed a member of the judiciary committee, and in December 1880 of the ways and means committee to succeed James A. Garfield; and in 1881 was chairman of the committee in charge of the Garfield memorial exercises in the House. In 1889-90 he was chairman of the ways and means committee. He was a candidate for speaker of the 51st Congress, but was defeated by T. B. Reed on the third ballot in the Republican caucus. He was known among the foremost orators of the House; and his speeches on arbitration as a solution of labor troubles (2 April 1886) and in support of the civil-service laws (24 April 1890) were most favorably received. But his principal efforts were made in connection with the tariff, which, from his first appearance in the House, was the chief object of his study. On 6 April 1882 he spoke in advocacy of protection; on 30 April 1884 in opposition to the Morrison tariff bill, making what was esteemed the ablest argument against that measure; and on 7 May 1890 in support of the general tariff bill, now known by his name, which, as chairman of the ways and means committee, he had introduced before the House on 16 April. The bill was passed by the House on 21 May, by the Senate on 11 September, and on 6 October became a law. His bill obtained for him an international reputation, and eventually the presidency. In 1884 he was delegate-at-large from Ohio to the Republican national convention at Chicago, where he supported Blaine's candidacy, and where, as chairman of the committee on resolutions, he helped to determine the platform of his party, which he read before the convention. In the Republican national convention at Chicago in 1888, he was again a delegate and chairman of the committee on resolutions. He supported the candidacy of John Sherman, although, when it was finally learned that Blaine would decline the nomination, he was himself the choice of many delegates and was strongly urged to permit the use of his name. At the Minneapolis convention of 1892 he was once more a delegate and was elected permanent chairman of the assembly. He supported the renomination of President Harrison, and though refusing the use of his own name, received the ballots of 182 delegates. He then left the chair and moved to make Harrison's nomination unanimous, which was accordingly done. In the ensuing campaign he took a very active part, traveling, it was estimated, more than 16,000 miles and speaking to more than 2,000,000 voters. In 1892-6 he was governor of Ohio, having been elected in 1891 by 21,500 plurality, and in 1893 by the unusual plurality of 80,995. Labor riots occurred during his administration, necessitating the placing of 3,000 militia troops in active service, but the difficulties were successfully adjusted. McKinley also personally directed the relief work for the

Copyright, 1902, by Rockwood.

WILLIAM McKINLEY,
TWENTY-FIFTH PRESIDENT OF THE UNITED STATES.

starving miners of the Hocking Valley district. He was nominated for the presidency by the Republican national convention which met at St. Louis 16 June 1896, and was elected by a plurality of 601,854 over W. J. Bryan, receiving a popular vote of 7,104,779, and in the electoral college a vote of 271 to 176 for Bryan. Throughout the campaign he remained in Canton, where he made over 300 speeches to more than 750,000 visitors. Under his administration decided increase in business prosperity followed the passage of the Dingley tariff measure. The most important event of his term was the Spanish-American war (q.v.), which he had believed might be prevented and had done all in his power to avert. When hostilities broke out on the part of certain inhabitants of the Philippine Islands, the President appointed a commission to study the situation and report on the most suitable mode of government for the new territory. On 7 July 1898 he approved the joint resolution of Congress for the annexation of the Hawaiian Islands, and in 1898 he also selected a delegation to represent the United States in the Hague peace conference which convened in May 1899. The original Philippine commission having rendered a report (31 Jan. 1900), the President appointed a new commission, known from its head, Judge W. H. Taft, as the Taft commission, under whose direction civil government was instituted in the islands on 1 Sept. 1900. (See PHILIPPINES, *History*.) In 1900 the President stood conspicuously for justice in the settlement of the difficulties in China which marked that summer. He was renominated for the presidency by the Republican national convention which met at Philadelphia on 25 June 1900, receiving the entire vote of the 930 delegates. He was elected by a popular vote of 7,206,677 to 6,374,397 for W. J. Bryan, receiving till then, the largest popular majority ever given a candidate for the presidency. He obtained 292 electoral votes and carried 28 States. On 5 Sept. 1901 he delivered at the Pan-American Exposition, Buffalo, N. Y., an important address, summarizing at once the problems then before the nation and his policy for their solution. On 6 September, while holding a reception in the Music Hall of the Exposition, he was twice shot by Leon Czolgosz (q.v.), an anarchist. He died on 14 September; and 19 September was appointed by his successor, President Roosevelt, a day of mourning and prayer throughout the United States. Unprecedented honors were paid to McKinley's memory in foreign capitals, notably in London, where memorial services were held in Westminster Abbey and St. Paul's Cathedral. For five minutes on the day of the funeral all motive power in the United States remained still. Consult: Smith (editor), 'Speeches and Addresses of William McKinley' (1893); Porter, 'The Life of Major McKinley' (1896); and 'Speeches and Addresses of William McKinley from 1897 to 1901' (1900). See also UNITED STATES, *History*.

McKinley Act, a name popularly given to a tariff bill reported to Congress, 21 May 1890, by the Ways and Means Committee of the House of Representatives, of which William McKinley was chairman. It became a law in October 1890, and was repealed in 1894. It increased the duties on wool, woolen manufactures, on tin-plate, barley, and some other agri-

cultural products, and remitted the duty on raw sugar. The reciprocity feature was an important part of the bill, providing for the remission of duty on certain products from those countries which should remove duties on American imported products. See *TARIFF*.

McKinley, Mount, United States, a peak of the Rocky Mountains, the highest in North America, south of the central part of Alaska; about 155 miles north of Cook Inlet. The Indian name for this peak is Traleyka, and the Russian name, Bolshaya. The fact that this is the highest land on the continent was not known till 1896 when Mr. Dickey explored the Sushitna River and the land near its source. He estimated the height of the peak at 20,000 feet, and named it McKinley, in honor of William McKinley (q.v.). In 1903 it was visited by members of the United States Geological Survey. The mountain is a great dome-shaped mass, over 20,000 feet above the sea.

McKinney, mā-kin'ē, Texas, city, county-seat of Collin County, on the Missouri, K. & T. and the Houston & T. C. R.R.'s; about 30 miles north by east of Dallas. It is situated in a rich agricultural region, in which cotton is cultivated quite extensively. The chief industrial establishments are cottonseed-oil mills, cotton gins, cotton compresses, wagon and carriage shops, and flour mills. It is the seat of the McKinney Collegiate Institute. The court-house is a fine building and cost \$100,000. The waterworks are owned and operated by the city. Pop. (1890) 2,489; (1900) 4,342.

Mackintosh, māk'in-tōsh, **Sir James**, Scottish historian and philosophical writer: b. Al-dourie, Aberdeenshire, 24 Oct. 1765; d. London 30 May 1832. He was educated at Aberdeen and Edinburgh; studied medicine and took the M.D. degree in 1787; published his 'Vindiciæ Gallicæ' in answer to Burke's 'Reflections on the French Revolution'; quitted the medical profession and was called to the English bar in 1795. By reason of his brilliant lectures on the 'Law of Nature and Nations,' and his defense of Peltier, who was prosecuted for a libel on Napoleon Bonaparte, he acquired fame at the bar, was knighted, and in 1804 appointed recorder of Bombay. After an honorable career in India he returned to England; entered Parliament for Nairn, and afterward for Naresborough; was professor of law at Haileybury College (1818-24), a member of privy council, and in 1830 commissioner of Indian affairs. Among his writings may be mentioned his 'History of England,' a fragment extending only to the reign of Elizabeth; 'Dissertation on the Progress of Ethical Philosophy' in the Encyclopædia Britannica; a 'Life of Sir Thomas More' in Lardner's Cyclopædia; and nine chapters of an unfinished work on the revolution of 1688.

Mackintosh, a water-proof overcoat, or outer garment, one of the products of modern rubber manufacture. It derives its name from the inventor. See *INDIA RUBBER*.

Macklin, māk'līn, **Charles**, Irish actor and dramatist: b. Ireland 1 May 1697; d. London 11 July 1797. He was the son of an Irish gentleman named McLaughlin and in 1733 appeared in minor parts at Drury Lane, London. He steadily rose in public favor, till 1741 he appeared in his greatest role, Shylock. He was

accounted from this period among the best actors of the time. His last performance was at Covent Garden in May 1789, at past the age of 90. In 1735 he accidentally killed a brother actor in a quarrel and was tried for murder; and was frequently afterward engaged in disputes and actions at law. Of his own plays only 'The Trueborn Irishman'; 'Love a-la-Mode' (1759); and 'The Man of the World' (1781) have been printed. Consult 'Life' by Parry (1891).

MacLagan, William Dalrymple, English archbishop: b. Edinburgh 1826. He was educated at Edinburgh and was graduated in mathematical honors at Cambridge University. He served in the Indian army (1847-52); was ordained deacon (1856) and priest (1857). He was appointed bishop of Lichfield (1878) and archbishop of York in 1891. He has published 'Pastoral Letters and Synodal Classes' (1891).

McLane, māk-lān', Allan, American soldier and jurist: b. 8 Aug. 1746; d. Wilmington, Del., 22 May 1829. In 1774 he settled in Kent County, Del., and in the Revolution he took a prominent part. He became a lieutenant in Thomas Rodney's regiment of Delaware militia, attained colonel's rank, and at the close of the war was appointed judge of the Delaware court of appeals. In 1790-8 he was United States marshal of Delaware under Washington's appointment, and from 1808 until his death, collector of Wilmington (Del.) port. He also served in the Delaware legislature, being for a time speaker of the lower house.

McLane, Louis, American statesman: b. Smyrna, Kent County, Del., 28 May 1786; d. Baltimore 7 Oct. 1857. He was the son of Allan McLane (q.v.), and entered the navy at an early age, served as a midshipman under the elder Decatur. Quitting the navy in 1801 he studied law, was admitted to the bar in 1808, and rose to eminence in the profession. He represented Delaware in Congress, 1816-27, when he was chosen United States senator. In 1829-31 he was minister to Great Britain, and on his return home was made secretary of the treasury. In 1833 he declined to sanction the removal of the deposits from the United States bank, and was consequently transferred by the President to the State Department. He held the office of secretary of state till June 1834, when he resigned and retired from political life. In 1837 he accepted the presidency of the Baltimore & Ohio Railroad, which he held till 1847. In June 1845 he was appointed by President Polk ambassador to London during the Oregon negotiations, after the settlement of which he resigned. In 1850 he was a member of the convention to reform the constitution of Maryland.

McLane, Robert Milligan, American politician and diplomat: b. Wilmington, Del., 23 June 1815; d. Paris, France, 16 April 1898. He studied at the Collège Bourbon of Paris (1829-31), was graduated from West Point in 1837, took active part in the Seminole War in Florida (1837), and served under Gen. Scott in the Cherokee country (Georgia). He resigned from the army in 1843, and having already been admitted to the bar in the District of Columbia, began practice at Baltimore, Md. In 1847-51 he was a Democratic member of the House of Representatives in the 30th and 31st Congresses. In 1853 he was appointed commissioner, with

powers of minister plenipotentiary, to China, Japan, Siam, Korea, and Cochin China; and from this mission he returned in 1856, having with Commodore Perry concluded important treaties. In 1859-61 he was minister to Mexico, in which capacity he signed the treaty of 1860. In 1861 he returned to Baltimore and there took a prominent part in the discussions attending the secession of the cotton States. He was one of the committee appointed by the Maryland legislature (May 1861) to confer with Lincoln in regard to alleged unconstitutional proceedings on the part of the Federal government within the State of Maryland. Upon the decision of the State legislature, based on the committee's report, that it was inexpedient for Maryland to secede, McLane retired from public affairs for a time. In 1877-8 he was State senator; in 1879-83 a representative in the 46th and 47th Congresses; and in 1883-5 governor of Maryland. He was minister to France in 1885-9 by appointment of President Cleveland.

Maclaren, māk-klār'en, Ian. See WATSON, JOHN.

McLaren, William Edward, American bishop: b. Geneva, Ontario County, N. Y., 13 Dec. 1831; d. New York, 19 Feb. 1905. He was graduated at Jefferson College, 1851, ordained to the Presbyterian ministry, 1860, and entered that of the Protestant Episcopal Church in 1872. Three years later he was appointed bishop of Illinois; after the subsequent division of the diocese became bishop of Chicago. Among his writings may be mentioned 'Catholic Dogma the Antidote of Doubt' (1884).

McLaughlin, māk-lāk'līn, Andrew Cunningham, American historical writer: b. Beardstown, Ill., 14 Feb. 1861. He was graduated from the University of Michigan in 1882, from its law school in 1885, and has been professor of history in that university since 1891. He served as director of the bureau of historical research of Carnegie Institution, Washington, D. C., 1903-5, and was managing editor of the 'American Historical Review,' 1901-5. He has written 'Lewis Cass' in 'American Statesmen' series (1891); 'History of Higher Education in Michigan'; 'Civil Government in Michigan' (1892); 'History of the American Nation' (1899); 'The Confederation and the Constitution' (1905); and edited Cooley's 'Principles of Constitutional Law' (1898).

McLaughlin, Mary Louise, American artist: b. Cincinnati. She began to decorate pottery in 1877 and made Losanti porcelain (1898), exhibiting for the first time in the Paris Exposition of 1900. She has been awarded several public honors for her work. Among her published writings are: 'China Painting'; 'Pottery Decoration'; 'Suggestions to China Painters'; 'Painting in Oil'; 'The Second Madame.'

Maclaurin, māk-lā'rīn, Colin, Scottish mathematician and philosopher: b. Kilmodan, Argyleshire, February 1698; d. 14 June 1746. He was educated at Glasgow University, and in 1717 became professor of mathematics in Marischal College, Aberdeen, and two years after was chosen fellow of the Royal Society. In 1720 he published 'Geometria Organica,' a work on curves. In 1725 he was elected professor

of mathematics at Edinburgh, where his lectures contributed much to raise the character of that university as a school of science. A controversy with Bishop Berkeley led to the publication of Maclaurin's great 'Treatise on Fluxions' (1742). He also wrote a 'Treatise on Algebra'; 'Account of Sir Isaac Newton's Philosophical Discoveries'; etc.

MacLaws, mäk-láz', Lafayette, American military officer: b. Augusta, Ga., 15 Jan. 1821; d. Savannah, Ga., 24 July 1897. He was graduated at West Point in 1842; served in the Mexican War till the surrender of Vera Cruz; and at the beginning of the Civil War was commissioned a brigadier-general in the Confederate army. He was promoted major-general 23 May 1862, and during the march of Sherman to the sea commanded the defenses of Savannah and had charge of the Military District of Georgia. He was appointed collector of internal revenue at Savannah in 1875 and postmaster there in 1876.

Maclay, ma-klá', Edgar Stanton, American author: b. Foochow, China, 18 April 1863. He was graduated at Syracuse University in 1885; was reporter on the *Brooklyn Times*, 1886-90, and on the *New York Tribune*, 1891-3; served on the editorial staff of the *Tribune*, 1893-5, and on that of the *New York Sun*, 1895-6. In 1896 he was appointed light-house-keeper at Old Field Point, and in 1901 received an appointment at the New York Navy-Yard. He edited the 'Journal' of William Maclay (q.v.), and is the author of a 'History of the United States Navy,' which occasioned much controversy and brought about his dismissal from government employ, by order of President Roosevelt, in 1901. The ground of this action, following Maclay's refusal of an official request for his resignation, was a passage in the 'History' stigmatizing Rear-Admiral Schley as a "caitiff, poltroon, and coward" for his conduct in the naval fight off Santiago, Cuba, 3 July 1898. Maclay has also written 'Reminiscences of the Old Navy' and 'The History of American Privateers.'

Maclay, William, American soldier and politician: b. New Garden, Chester County, Pa., 1737; d. 1804. He was educated in his native place; was a lieutenant in the French and Indian War, taking part in the expedition against Fort Duquesne in 1758, and afterward serving under Gen. Bouquet. He studied law, was admitted to the bar, went to England on behalf of militia officers serving in the French and Indian War, to confer upon their claims for land-grants with the proprietors of Pennsylvania, and on his return became attorney to the Penn family. In the Revolution he raised troops and equipped them, was assistant commissary of purchase, and performed some field service. In 1781 he was elected to the Pennsylvania Assembly, afterward held other offices in the State, and with Robert Morris (q.v.) was elected to the United States Senate, they being Pennsylvania's first representatives in that body. His service there ended in 1791, but in the Senate he had shown deep-seated hostility to Washington and his administration, which was the chief distinction of Maclay's senatorial career. In his later years he was a member of the Pennsylvania legislature and his last public office was that of a county

judge. Consult his 'Journal,' edited by Edgar Stanton Maclay (q.v.).

Macle, mäk'l, in mineralogy, a variety of andalusite, occurring in long, tapering crystals in clay-slate. They have the axes and angles of a different color from the rest of the crystals, owing to a regular arrangement of impurities in the interior.

MacLean, George Edwin, American educator: b. Rockville, Conn., 31 Aug. 1850. He was graduated at Williams College in 1871 and at Yale Theological Seminary in 1874; from 1877 to 1881 was pastor at Troy, N. Y.; studied in Germany; and in 1883 became professor of English language and literature at the University of Minnesota. He was chancellor of the University of Nebraska, 1895-9, and since 1899 has been president of the University of Iowa. His writings include: 'A Chart of English Literature' (1892); 'Old and Middle English Reader' (1893); and 'A Decade of Development in American State Universities' (1898). He has edited: 'Ælfric's Anglo-Saxon Version of Alcuin Interrogationes Sigewulfi Presbyteri in Genesis' (1883); 'An Introductory Course in Old English,' by Wilkin and Babcock (1888); and 'An Old and Middle English Reader' by Zupitza (1889).

McLean, George P., American lawyer and politician: b. Simsbury, Conn., 7 Oct. 1857. He was for a time a reporter on the *Hartford Evening Post*, then studied law, and was admitted to the bar in 1881, and immediately commenced practice in Hartford. In 1883-4 he was a member of the General Assembly, where he soon became distinguished for facility in debate and was considered one of the leaders of the Republican party. In 1888 he was elected State senator, and in 1900 nominated by his party as governor of Connecticut and elected. Though he was not widely known at the time of his election, his independent position in regard to constitutional reform soon made him prominent; both in his first governor's message and before the constitutional convention, he advocated representation in the legislature according to population instead of by towns. Though in this he opposed certain elements in his own party, he gained support from a considerable number of Democrats and great personal popularity in the cities. In 1902 he was offered renomination, but declined, in 1903-4 he was a prominent candidate for United States Senator.

MacLean, John, American jurist and statesman: b. Morris County, N. J., 11 March 1785; d. 4 April 1861. He removed with his parents to Warren County, Ohio, in 1799, later went to Cincinnati, where he studied law, and was admitted to the bar in 1807, and commenced practice at Lebanon, Warren County, Ohio. He was a member of Congress 1812-16, and from 1816-22 judge of the supreme court of Ohio. In July 1823 he was appointed postmaster-general, the Post-office Department being then in a very disordered and inefficient condition. Under his administration this branch of the public service was restored to order, and managed with a vigor, method, and economy that soon secured an almost unexampled degree of applause and public confidence. In 1829 he became associate justice of the Supreme Court of the United States. In this capacity his

McLEAN — McLEMORE'S COVE

charges to grand juries while on circuit are distinguished for ability and eloquence. In the Dred Scott case he dissented from the decision of the court as given by Chief Justice Taney, and expressed the opinion that slavery has its origin merely in power, and is against right, and in this country is sustained only by local law.

McLean, John, American educator; b. Princeton, N. J., 1800; d. there 1886. His whole life was spent in Princeton. He was graduated from the college there in 1816, became tutor in the institution in 1818, and was a member of the faculty till 1868, when he resigned the presidency, which he had held from 1854. He published 'Lecture on a Common School System for New Jersey' (1829), which in later years had much influence in the establishment of such a system; 'History of the College of New Jersey' (1877); etc.

McLean, Sarah Pratt. See GREENE, SARAH PRATT McLEAN.

McLean, Simon James, American sociologist; b. Brooklyn, N. Y., 14 June 1871. He was graduated from the University of Toronto in 1894 and has been professor of economics and sociology in the University of Arkansas from 1897, and associate professor of economics in Leland Stanford Junior University from 1902. He has published 'Tariff History of Canada' (1895).

McLellan, mäk-lē'lan, Isaac, American poet; b. Portland, Maine, 21 May 1806; d. Greenport, L. I., 20 Aug. 1899. He was graduated at Bowdoin College, practised law for several years in Boston, Mass., and in 1851 removed to New York and gave his whole attention to literature and field sports. His liking for the latter was so strong indeed, and his poems on these themes so numerous, that he gained the title of "the poet-sportsman." Some of his early poems, such as 'The Death of Napoleon' and 'New England's Dead,' attracted much attention. He was the author of 'The Fall of the Indian' (1830); 'Mount Auburn' (1843); and 'Poems of the Rod and Gun' (1886).

McLemore's Cove, Ga., Military Operations at. While there was little fighting in the cove, the operations there in September 1863 were vital to the success of Gen. Rosecrans' campaign for Chattanooga. The failure of Gen. Bragg's excellent combinations immediately increased the difficulty of interposing his army between the Union army and Chattanooga and, in the end, made it impossible.

Lookout Mountain bounds the cove on the west. Following its eastern base from Chattanooga southward, it is 24 miles to Stevens' Gap, over which the Fourteenth corps, Gen. Thomas', which constituted the centre of Rosecrans' army, crossed Lookout from the west into the cove. Eight miles beyond is Dougherty's Gap, from which point Pigeon Mountain, running northeastwardly, forms the eastern boundary of the cove. The triangular area thus enclosed is from five to eight miles wide, the mouth opening toward Chattanooga, and contains from 80 to 100 square miles. Gen. Bragg, in evacuating Chattanooga, because of Rosecrans' flank movement, had conducted his army by way of Rossville and Lee and Gordon's Mill and established it behind Pigeon Mountain, from a point near Lee and Gordon's to Lafayette, 13 miles beyond. From this position of his army

there were four gaps through which roads led into McLemore's Cove. Opposite Lafayette was Dug Gap, to the south of it Blue Bird, and to the north Cattlett's and Wrothen's. Dug Gap was directly opposite Stevens' Gap. The Chickamauga Creek rises near Dougherty's Gap and runs northward through the cove.

The right of the Union army, A. McD. McCook's Twentieth corps, with the cavalry corps, Gen. D. S. Stanley, crossed Lookout at Valley Head, 42 miles south of Chattanooga, and descended south of Dougherty's Gap. The left of this army, Crittenden's Twenty-first corps, had crossed the north point of Lookout near Chattanooga and, leaving one brigade in that city, had advanced to the vicinity of Lee and Gordon's Mill. It there formed the left of the Union army. The centre corps was at Stevens' Gap, 15 miles distant, the right corps about 25 miles beyond that point, with the cavalry still farther south. This separation of Rosecrans' army was made necessary by the fact that there were no roads practicable for wheels crossing Lookout Mountain in closer proximity.

Gen. Bragg was fully informed of the movements, and the isolation of the several Union corps. These movements, which placed each corps beyond supporting distance from either of the others, were immediately rendered still more precarious by reports received from Gen. Sheridan on the extreme right that the enemy was retreating toward Rome, which led Gen. Rosecrans to order pursuit. Gen. Thomas urged active concentrations instead, but was overruled.

Gen. Bragg, from his position behind Pigeon Mountain, commanding the four gaps opening directly upon the advance of the centre across the cove, was in most favorable position for first striking Gen. Thomas with effect, and then turning upon either of the wings before they could attain supporting distance. Had Bragg's orders been promptly and vigorously executed the situation of the Union army would have been critical.

The night of the 9th, Negley's division, forming the Union advance from Stevens' Gap along the road leading through Dug Gap to Lafayette, encountered the enemy in the gap, and later in the night it was ascertained that a strong force was concentrating there.

Gen. Bragg, in developing his plan, had advanced Hindman's division from the Lafayette side of the mountain, and ordered Gen. Hill to send Cleburne to co-operate. Late at night Hill sent word that Cleburne was sick, the gaps blocked with felled trees, and that the movement was, therefore, impracticable.

Early the next morning Gen. Buckner from the extreme right was ordered to advance into the cove to support Hindman. This junction was not effected until the afternoon of the 10th. Meantime, Negley had withdrawn his division from Dug Gap and was maneuvering in defense. Hindman, instead of attacking as ordered, sent a staff-officer to Bragg at Lafayette to suggest a change of plan. This officer reached Bragg at midnight and was at once directed to return and notify Hindman to carry out the orders he had received. Cleburne was then in Dug Gap, and had promptly cleared away obstructions. Walker's reserve corps was ordered forward to join Cleburne in the attack, and all impatiently waited for Hindman's guns. Bragg

had ordered seven divisions to co-operate in this movement against Thomas' three which composed the Union centre. Hindman did not attack until afternoon. At that time Baird's division had arrived from Stevens' Gap to support Negley, and by brilliant movements in retreat, with some sharp fighting by T. R. Stanley's and Starkweather's brigades, the two divisions with their trains were withdrawn in perfect order to Bailey's crossroads, a strong strategic position in front of Stevens' Gap, where Brannan's division, which had completed the crossing of Lookout, was within easy supporting distance. Thus Bragg's attempt to crush the Union centre failed. For this failure he held Hill and Hindman responsible.

Bragg then withdrew the forces operating against the Union centre to Lafayette, and at once despatched Polk's and Walker's corps with orders to attack Crittenden's corps in the vicinity of Lee and Gordon's Mill. This corps at the time was known to Bragg to be divided, with one of its three divisions near Ringgold. Polk was urged to attack with the greatest promptness. He, however, was led to believe that a general attack on his column was about to be delivered. Instead of carrying out Bragg's orders, he therefore awaited attack and sent for the whole of Buckner's corps as reinforcements. This delay enabled Crittenden to unite his forces, cross the Chickamauga, and take a strong position on the bluffs overlooking that stream at Lee and Gordon's. Thus Bragg's attempt to crush the Union left failed, as his movement on the centre had miscarried. For this Polk was held responsible.

Meantime the Union right was withdrawing under orders to join the centre at Stevens' Gap. Rosecrans had early discovered that Bragg, instead of retreating, was concentrated for battle, and that Johnston from Mississippi and Longstreet from Virginia were about to join him. Gen. Rosecrans in his report says: "It then became a matter of life and death to effect the concentration of the army." The flanks of the army were 40 miles apart by the nearest practicable roads, and the centre was obliged to remain near Stevens' Gap until the right corps arrived.

Gen. Bragg's third plan, for which orders were promptly given, was to move his army down the valley of the Chickamauga, cross at the bridges and fords below Lee and Gordon's Mill, sweep up the valley, attack Crittenden, the left of Rosecrans' army, drive it back on the centre, and thus, interposing between the Union army and Chattanooga, push it back into the mountains and regain that most important city. Rosecrans, however, by an undiscovered night march moved his centre and right from the cove to the left of Crittenden, and at sunrise of 19 September had interposed between Bragg and Chattanooga on the field of Chickamauga. These movements of the opposing armies brought on the battle of Chickamauga (q.v.).

H. V. BOYNTON.

McLennan, māk-lēn'an, **John Ferguson**, Scottish sociologist: b. Inverness 14 Oct. 1827; d. Hayes Common, Kent, 16 June 1881. He was educated at King's College, Aberdeen, and Trinity College, Cambridge and after two years' journalism in London returned to Edinburgh, and was called to the bar in 1857. His first important publication was the article on 'Law' in

the 8th edition of the 'Encyclopædia Britannica' (1857), and in 1865 he elaborated some of its speculations in 'Primitive Marriage: an Inquiry into the Origin of the Form of Capture in Marriage Ceremonies.' In 1876 his 'Primitive Marriage' was republished with 'Kinship in Ancient Greece' and other matter under the title of 'Studies in Ancient History.' An unfinished work by him, directed against Sir H. S. Maine's patriarchal theory, was completed and published in 1885 by his brother under the title of 'The Patriarchal Theory.' In 1896 a second series of 'Studies in Ancient History,' treating of the origin of exogamy, was edited by his widow and Arthur Platt. Though his views are still and probably will remain matter of controversy, the study of primitive society received a powerful impetus from his important investigations.

McLeod, māk-lē'ōd, **Archibald Angus**, American railway official: b. Compton County, Quebec, Canada, 1848; d. 1902. Early in life he came to the United States, where he became a rodman on the docks of the Northern Pacific railway at Duluth, and in 1885 manager of the Elmira, Cortland and Northern line. He then was successively acting general manager (1886), vice-president and general manager (1887), and president (1890) of the Reading system. His consolidation of the Lehigh Valley and Jersey Central with the Reading, under Reading control, for the purpose of controlling the carrying trade of the coal fields, resulted in the Reading passing into the hands of three receivers, of whom McLeod was one.

MacLeod, mǎc-low'd, **Donald**, Scottish Presbyterian clergyman and author: b. Campsie, Stirlingshire, 18 March 1831. He is a brother of Norman MacLeod (q.v.), whom he succeeded as editor of 'Good Words' in 1872. He was educated at the University of Glasgow. He held pastorates at Lauder (1858), Linlithgow (1862) and Glasgow (1869), and, like his brother, was chaplain to Queen Victoria. He published 'Sunday Home Service' (1885); 'Christ and Modern Society' (1893); etc.

MacLeod, **Fiona**, pseudonym of William Sharp (q.v.), Scottish poet and novelist: b. Paisley 12 Sept. 1856; d. Sicily 13 Dec. 1905. A part of his youth was spent in the Hebrides and in the islands of Iona and Arran. His stories and poems have attracted great attention by reason of their freshness of treatment and originality of conception. Among his works are: 'Pharais' (1895), a romance; 'The Mountain Lovers' (1895); 'The Sin-Eater and Other Tales' (1895); 'The Washer of the Ford' (1896); 'Green Fire' (1896); 'From the Hills of Dream' (1896); 'The Laughter of Peterkin' (1897); 'Through the Ivory Gate' (1901); 'The Silence of Amor' (1902).

MacLeod, **Norman**, Scottish Presbyterian clergyman: b. Campbelltown, Argyleshire, 3 June 1812; d. Glasgow 16 June 1872. Educated at Glasgow, Edinburgh, and in Germany, he became minister first of Loudon and then of Dalkeith, when he published his first work, 'The Earnest Student,' and became editor of the 'Edinburgh Christian Magazine.' In 1851 he became minister of the Barony parish, Glasgow, where he labored with increasing popularity for the rest of his career. In 1854 he was appointed one of the queen's chaplains for Scotland and

dean of the order of the Thistle. He became editor of 'Good Words' in 1860 and continued in that post till his death. In 1867 he visited India, and in 1871 published 'Peeps at the Far East.' In 1869 he was elected moderator of the General Assembly of the Church of Scotland. Consult D. MacLeod, 'Memoir of Norman MacLeod' (1872).

McLeod, Xavier Donald, American writer: b. New York 17 Nov. 1821; d. near Cincinnati, Ohio, 20 July 1865. He was graduated from Columbia and entered the Episcopal ministry in 1845. Becoming a Roman Catholic in 1852 he took priest's orders in that faith later and was professor of rhetoric in Mount Saint Mary's College. He published 'Pynnshurst' (1852); 'Life of Sir Walter Scott' (1852); 'The Blood-Stone' (1853); 'Lescure'; 'Life of Mary Queen of Scots' (1857); etc.

MacIse, Daniel, English painter: b. Cork 2 Feb. 1806; d. Cheyne Walk, Chelsea, 25 April 1870. He became a student at the Royal Academy in 1828, and began to exhibit in 1829, but it was not until 1833 that he established his reputation with his picture of 'Snap Apple Night.' Three years after he was elected an associate, and in 1840 he became a full member of the Royal Academy. MacIse was commissioned to paint for the new Houses of Parliament, and produced 'The Spirit of Chivalry'; 'The Spirit of Religion,' and the two great paintings of the 'Meeting of Wellington and Blücher after Waterloo,' and the 'Death of Nelson' (1858-64), for which patriotic paintings he refused all remuneration. Among his best known pictures are 'Merry Christmas in the Baron's Hall'; 'The Ordeal of Touch'; 'The Marriage of Strongbow and Eva'; the 'Play Scene in Hamlet'; the 'Banquet Scene in Macbeth,' etc. His sketches, book illustrations, humorous drawings, and outline portraits were very numerous. He declined the presidency of the Academy in 1866. His works show great fertility of invention, skill in composition, and excellence in drawing, but his color is coarse, and his pictures are sometimes disagreeable unless seen from a distance. Consult O'Driscoll, 'Memoir of Daniel MacIse' (1871).

Maclure, mäk-lür', William, American geologist: b. Ayr, Scotland, 1763; d. San Angel, near the city of Mexico, 23 March 1840. In 1796 he visited the United States, and in 1803 was in Europe as one of the commissioners to settle the claims of American citizens against France for spoiliations during the revolution in that country. On returning to America he engaged with zeal in the extraordinary private undertaking of a geological survey of the whole country. Depending on his own resources and observations at a time when geology was unknown as a science, and few could appreciate his motives, he visited almost every State and Territory, crossing and recrossing the Alleghanies no fewer than 50 times. His first communication to the public was a memoir entitled 'Observations on the Geology of the United States, explanatory of a Geological Map,' read before the American Philosophical Society, 20 Jan. 1809, and published in Vol. VI. of their 'Transactions.' He still continued his explorations, and on 16 May 1817, presented another memoir to the society, published in their 'Transactions,' and also in a separate volume. The former publica-

tion was 6 years prior to that of the geological map of England prepared by William Smith, a production which gave him the title of father of English geology. To Maclure is equally due the title of father of American geology. His publications attracted much attention to the science. He now settled in Philadelphia and gave his books and collections to the Academy of Natural Sciences of which he was president from 1817 till his death. He lived in Spain, 1819-24, where he attempted to found an agricultural college, and returning in 1824 to the United States attempted to carry out a similar scheme in the New Harmony settlement in Indiana. Several distinguished naturalists from Philadelphia joined him in this enterprise, but the scheme failed. After 1828 he lived in Mexico, always, however, with the intention of returning to the United States, and with his interest in the progress of scientific education there unabated. While in Mexico he wrote 'Opinions on Various Subjects,' devoted mainly to political economy (1837).

MacMahon, mäk-mä'hôn, Ella, English novelist. She has published 'A New Note' (1894); 'A Modern Man' (1895); 'A Pitiful Passion' (1896); 'The Touchstone of Life' (1897); 'An Honorable Estate' (1898); 'Fortune's Yellow' (1900); 'Such as Have Erred' (1902).

MacMahon, Marie Edme Patrick Maurice de, Duke of Magenta and Marshal of France: b. Sully, Saône et Loire, 13 June 1808; d. near Montargis 17 Oct. 1893. He was educated at the military college of St. Cyr; served with distinction in Algeria; became brigadier-general in 1848; received command of a division during the Crimean war, and assisted in storming the Malakoff; took part in the campaign of 1859 against Austria, and won the battle of Magenta by his prompt handling of the left wing; and after the war became governor-general of Algeria. At the outbreak of war between France and Germany (1870) MacMahon was placed in command of the First army corps, which was defeated at Weissenburg and Wörth, and finally fell back upon Châlons. Here he rallied his forces, and proceeded northeastward to relieve Bazaine, who was besieged in Metz, but he was pursued by the Germans, shut up by them in the town of Sedan, and wounded in the battle before the final surrender. After the armistice with Germany he was employed by the Versailles government in putting down the commune, and in 1873 was elected president of the republic, a position which he occupied until 1879. Consult Daudet, 'Le Maréchal de MacMahon' (1883); LaFarge, 'Histoire Complète de MacMahon, Maréchal de France, Duc de Magenta' (1898).

McMas'ter, Guy Humphrey, American poet and jurist: b. Clyde, N. Y., 3 Jan. 1829; d. Bath, Steuben County, N. Y., 13 Sept. 1887. He was educated at Hamilton College, Clinton, N. Y., studied law and became judge of Steuben County in 1864 and surrogate in 1884. At 19 he wrote 'Carmen Bellicosum,' better known as 'The Old Continentals,' published in the 'Knickerbocker Magazine' and still popular. Aside from this, his best-known poems are: 'A Dream of Thanksgiving Eve' (1864); 'The Professor's Guest Chamber' (1880); 'The Commanders' (1887).

McMaster, John Bach, American historian: b. Brooklyn 29 June 1852. He graduated from the College of the City of New York in 1872, studied civil engineering, and 1877 became instructor of civil engineering at Princeton. In 1883 he published the first volume of his 'History of the People of the United States,' and the same year was appointed professor of American history in the University of Pennsylvania. His 'History,' of which five volumes were published in 1900, has become a standard work. It covers a period reaching from the adoption of the Constitution in 1789 to the outbreak of the Civil War,—less than 100 years, but a crucial time for the shaping of the country. The account of the formative time, the day of the pioneer and the settler, engages his particular attention and receives his most careful treatment. He strives to give a picture of social rather than constitutional and political growth; and tells the story of national evolution with admirable lucidity and simplicity of style, and always with an appeal to fact precluding the danger of the subjective writing of history to fit a theory. His other works are: 'Benjamin Franklin as a Man of Letters' (1887); 'With the Fathers, Studies in American History' (1896); 'Origin, Meaning, and Application of the Monroe Doctrine' (1897); 'A School History of the United States' (1897); 'A Primary School History of the United States' (1901); 'Daniel Webster' (1902); 'Brief History of the United States' (1903).

McMaster University, Toronto, Canada, is controlled by the Baptist Convention of Ontario and Quebec. It came into existence through the gift of about \$1,000,000 by the late Senator William McMaster, of Toronto, but it is really a development of educational work formerly conducted at Woodstock, Ont. In 1857, under the leadership of the Rev. R. A. Fyfe, D.D., subscribers to the funds of a projected college secured from the Canadian Parliament an act to incorporate "The Canadian Literary Institute," to be located at Woodstock. This school aimed at co-education and provided both literary and theological courses. In 1875 it secured affiliation with the University of Toronto. In 1881, through the liberality of Mr. McMaster, the Toronto Baptist College was instituted and to it was transferred the theological department of the school at Woodstock. The latter continued its literary work, and, without change of corporation, its name was changed to Woodstock College. Toronto Baptist College was affiliated to the University of Toronto in 1885, but as the result of a further donation by Mr. McMaster it was decided to establish a university to grant degrees in the "several arts, sciences and faculties," as well as in theology. A charter was secured from the legislature of Ontario in 1887, and all the property and rights of the two separate corporations were vested in McMaster University and placed under the authority of the Board of Governors, 16 in number (exclusive of the Chancellor), responsible to the Baptist Convention of Ontario and Quebec. The control of all that pertains to the courses of study belongs to the University Senate, a body made up of the members of the Board of Governors, a certain number representing the teaching faculties and others chosen by the graduates in arts and theology. The Senate also

nominates, subject to the approval of the Governors, the Chancellor and members of the faculties. Woodstock College, now a school for young men alone, and Moulton College, for young women, are academical departments of the University. Noteworthy provisions of the act of incorporation are that McMaster University is "a Christian school of learning," the Bible must be included in the course of study, every member of the teaching staff in theology must be a member of a regular Baptist church in Canada, and all other teachers members of some "Evangelical Christian Church." The first class in arts was graduated in 1894. The total number of students for the year 1903-4 in the three schools of the university was 470.

McMaster, William, Canadian senator and philanthropist: b. Tyrone, Ireland, 24 Dec. 1811; d. Toronto, Canada, 22 Sept. 1887. When 22 years of age, he emigrated to Canada, and after several years' experience in a large wholesale firm in Toronto, commenced business on his own account. He was elected a member of the legislative council for the Midland division of Canada in 1862, and held this seat until he was called to the Senate by royal proclamation in 1867. He was prominently identified with many public institutions, notably as president of the Canadian Bank of Commerce, member of the senate of the University of Toronto, chairman of the Canadian board of the Great Western Railway, and became widely known by his liberal donations to educational and religious institutions, especially those of the Baptist denomination, of which sect he was a member. McMaster University, Toronto, is named in his honor.

McMichael, Morton, American journalist, politician, and orator: b. Burlington, N. J., 2 Oct. 1807; d. Philadelphia, Pa., 6 Jan. 1879. After education in the public schools, he studied law at the University of Pennsylvania, and became a member of the Philadelphia bar in 1827. The year previously he became editor of the 'Saturday Evening Post,' and as an active politician served for several years on the aldermanic bench in Philadelphia. From 1831 to 1836 he was editor-in-chief of the 'Saturday Courier,' and later was connected with the 'Saturday News,' the 'Saturday Gazette,' the 'North American,' and 'United States Gazette,' in 1847 consolidating the last two in one journal, of which he was sole proprietor from 1854 until his death. He was mayor of Philadelphia from 1866 to 1869; president of the Park Commission from its organization in 1867 until his death; and in 1873 was appointed a delegate to the fourth constitutional convention of Pennsylvania. His speeches on public occasions were renowned as models of oratory. A bronze statue was erected to his memory in Fairmount Park.

McMichael, William, American soldier and lawyer: b. Philadelphia, Pa., 4 March 1841; d. New York city, 20 April 1893. The third son of Morton McMichael, he graduated at the University of Pennsylvania in 1859, but left his law studies in April 1861, to enlist as a private when President Lincoln issued his first call for troops. He attained rapid promotion to the grade of colonel, and served under Generals Thomas, Rosecrans, and Grant. He resumed his interrupted law studies after the war and

in 1865 became a member of the Philadelphia bar. During General Grant's first tenure of the Presidency he was appointed solicitor of internal revenue of the Treasury Department, but resigned the office in 1871 on his appointment as United States assistant attorney-general. In 1877 he was appointed United States district attorney for the east district of Pennsylvania, but resigned shortly after to go into private practice. President Garfield appointed him a member of the United States Board of Indian Commissioners; in 1882 he was a candidate for Congress on the Independent Republican ticket; and later became a member of the bar of New York city. Like his father, he was renowned for his oratorical gifts.

McMicken, Gilbert, Canadian official and inventor; b. in Wigtownshire, Scotland, in 1813; d. Manitoba 6 March 1890. He emigrated to Canada in his 21st year, lived for several years in the Niagara district, and was appointed to various municipal offices. Interested in telegraphy, he patented two inventions in 1847, and spanned the Niagara River with the first electric wire stretched across it. From 1857 to 1861 he was the representative from Welland County in the Canadian Legislative Assembly; and as stipendiary magistrate for Canada West during the Civil War in the United States, received high commendation from Lord Monk for the able discharge of his duties. He was commissioner of police for the Dominion, and was active in the suppression of the Fenian Raid of 1870. He was in charge of the Dominion land-office in Manitoba from its opening until his retirement in 1877, also holding the office of assistant receiver-general and other posts. From 1880-82 he was a Conservative representative for Cartier in the Dominion Parliament.

Macmillan, a name for many years prominently identified with English publishing interests. Most important was **DANIEL MACMILLAN**: b. Upper Corrie, Isle of Arran, 13 Sept. 1813; d. 27 June 1857. He took service with a Cambridge bookseller in 1833, and with Seeley, Fleet Street, London, in 1837. He set up in business in London in 1843, but soon removed to Cambridge, and by 1856 had developed a very prosperous trade. He published Hughes' 'Tom Brown's School Days' in 1857; but he was chiefly aided by educational publications and the works of Kingsley and F. D. Maurice. Associated with him from 1843 was his brother, **ALEXANDER MACMILLAN**, previously a school-teacher at Nitshill, not far from Paisley. In 1863 he was made publisher to Oxford University, and in the same year removed the business to London. 'Macmillan's Magazine' made its appearance in 1859. The firm maintains a branch in New York, and publishes many university and educational works, as well as considerable fiction, by American authors.

MacMillan, Conway, American botanist: b. Hillsdale, Mich., 26 Aug. 1867. He was graduated from the University of Nebraska in 1885 and has been State botanist of Minnesota from 1891. He has published 'Twenty-two Common Insects of Nebraska'; 'The Metaspermæ of the Mississippi Valley'; 'Minnesota Plant Life'; etc.

MacMillan, Hugh, Scottish Presbyterian clergyman: b. Aberfeldy, Perthshire, Scotland,

17 Sept. 1833; d. 1903. At the time of his death he was minister of the Free West Church, Greenock, N. B. He has been noted as a brilliant writer and preacher, and among his published works may be mentioned: 'Bible Teachings in Nature' (1867); 'Holidays in High Lands' (1869); 'The Ministry of Nature' (1871); 'The True Vine' (1871); 'The Mystery of Grace' (1893); 'The Daisies of Nazareth' (1894); 'The Clock of Nature' (1896); several of which have been translated into German, Norwegian, Swedish, French, Italian, etc.

McMillan, James, American capitalist and Senator: b. Hamilton, Ont., 12 March 1838; d. Manchester, Mass., 1902. He entered business at Detroit, Mich., in 1855, since which he enjoyed a prosperous career as organizer of the Michigan Car Company, and general manufacturer in the railroad business. He was elected to the United States Senate as a Republican in 1889, and re-elected in 1895 and 1901. He was active in many commercial enterprises and was president of the Detroit Iron Furnace Company, which employed more than 3,000 men. He gave the city of Detroit a thoroughly equipped hospital, costing \$250,000, and endowed it with \$300,000; to the University of Michigan a fine Shakespearean library, and added to the college buildings McMillan Hall. He bestowed substantial benefactions on several other institutions.

McMillan, James William, American soldier: b. Clark County, western Virginia, 1826; d. 10 March 1903. At the time of his death he was a member of the board of review of the Pension Bureau. He was brevetted major-general in March 1865, commanded the 1st and 2d brigades of the Nineteenth army corps, served with Butler in the Gulf campaign, and captured the blockade runner Fox, one of the richest prizes of the Civil War.

Macmillan, John, Scottish Presbyterian clergyman: b. Minnigaff, Kirkcudbrightshire, Scotland, 1670; d. Bothwell, 1753. He played a prominent part in the religious movements of his day, being founder of the Reformed Presbyterian Church, whose adherents are often called Cameronians (q.v.) or Macmillanites.

McMillan, Thomas, American Roman Catholic priest of the Missionary Society of Saint Paul the Apostle: b. Ayr, Scotland, 13 June 1851. He is of Irish descent, and when 3 years old came with his parents to America. In 1874 he entered the Missionary Society of Saint Paul the Apostle. His chief work has been in Sunday schools. In 1886 he instituted a "reading circle" movement, which has extended over all the country. In 1889 he was largely instrumental in bringing together, at New York, a large number of editors, journalists, and authors from different parts of the United States to discuss ways and means of making the press more effective in uplifting humanity. This meeting was known as that for the promotion of the 'Apostolate of the Press.' In 1892 he was made chairman of the board of studies of the Catholic Summer School of America, a position which he still holds (1903). In 1897 he was the prime mover in the organization of the 'Child Study Congress' held in New York city.

MACMILLANITES — MACOMB

Macmillanites. See **MACMILLAN, JOHN**, and **CAMERONIANS**.

McMillen, Benton, American politician: b. Monroe County, Ky., 11 Sept. 1845. He received an academic education and in 1871 engaged in law practice. In 1874 he was elected to the State legislature of Tennessee, and in 1877 was appointed special judge of the circuit court. He was elected to Congress in 1879, and served until 1899, when he was elected governor of Tennessee, and two years later was re-elected.

McMinnville, māk-mīn'vil, Ore., city, county-seat of Yamhill County; on the Yamhill River, and on the Southern Pacific railroad; about 55 miles southwest of Portland. It is situated in an agricultural region, in which hops, wheat, and fruit are raised extensively. The city has considerable trade in agricultural products, live-stock, lumber, wool, and some dairy products. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1900) 1,420.

McMinnville, Tenn., town, county-seat of Warren County; on the Nashville, C. & St. L. railroad; about 80 miles southeast of Nashville. It is in the midst of an agricultural region, and in the vicinity is found excellent building stone. Its manufactures are cotton and woolen goods, flour and lumber, foundry and machine-shop products, furniture, and dairy products. It is the seat of the Cumberland University Training School. Pop. (1900) 1,980.

Macmonnies, māk-mūn'iz, **Frederick William**, American sculptor: b. Brooklyn, N. Y., 20 Sept. 1863. In his 17th year he became pupil and assistant to Augustus Saint Gaudens, and going to Europe in 1884 he was admitted to the studio of Falguière, and after two years' instruction there opened a studio of his own. In 1889 his statue of 'Diana' was honorably mentioned in the Salon, and his 'Nathan Hale' in City Hall Park, New York, and 'James S. T. Stranahan' in Prospect Park, Brooklyn, were much admired in the Salon 1891. His 'Bacchante' (Salon 1894) was purchased for the Luxembourg. He has been prolific in the creations of the chisel, and his work is to be seen in Washington Memorial Arch, New York city, the Soldiers' and Sailors' Monument in Indianapolis, in the statues of Prospect Park, Brooklyn, and the Battle Monument at West Point. Since 1900 he has devoted himself more and more to painting, in which he exhibits delicacy, freshness of design, and a brilliant technique.

McMurrick, James Playfair, American scientist: b. Toronto, Ont., 16 Oct. 1859. He was graduated from the University of Toronto in 1879, and is professor of anatomy in the University of Michigan. He has published: 'Invertebrate Morphology' (1894); 'The Development of the Human Body' (1902).

McMurtree, māk-mēr'tri, **William**, American chemist: b. Belvidere, N. J., 10 March 1851. He was graduated from Lafayette College, Easton, Pa., in 1871 as a mining engineer, and was chemist-in-chief of the Department of Agriculture in Washington 1873-8. After serving as the special agent of that department at the Paris Exposition of 1878 he was professor of chemistry in the University of Illinois 1882-6, and chemist to the State board of agriculture

1886-8. In 1884 he received from the French government the title of Chevalier du Mérite Agricole, and in 1897 was elected president of the American Chemical Society. He has published 'Culture of the Sugar Beet' (1879); 'Culture of Sumac' (1879); 'Examination of Wools and Other Animal Fibres' (1887); etc.

McNab, STR **Alan Napier**, Canadian statesman: b. Niagara, Ont., 19 Feb. 1798; d. 8 Aug. 1862. He entered the navy as midshipman in 1813, but soon abandoned the navy for the army; was present at the capture of Fort Niagara, and commanded the advance guard at the battle of Plattsburg. At the close of the war he studied law, and practised in Hamilton, and in 1829 was elected a member of the assembly for the County of Wentworth, and after serving three terms was returned by the electors of Hamilton. He was subsequently chosen speaker of the lower house. During the insurrection of 1837-8 he commanded the militia on the Niagara frontier, routed the insurgents near Toronto 7 Dec. 1837, and a party of American sympathizers having occupied Navy Island in the Niagara River, whence they were cannonading the village of Chippewa on the Canadian side, he sent a party to seize the steamer *Caroline*, employed to convey them supplies, and having driven the crew ashore, set fire to it and sent it over the Falls. Although the seizure was made on the American side of the river, the act was approved by the British government, and for his services to the crown during this insurrection McNab was knighted. In 1854 he was prime minister under the Earl of Elgin, retaining office for a few months under his successor, Sir Edmund Head. On retiring from the premiership in 1856 he was made a baronet.

MacNab, Frances. See **FRASER, ALICE**.

McNair, māk-nār', **Frederick Vallette**, American naval officer: b. Jenkintown, Pa., 13 Jan. 1839. He was educated at the United States Naval Academy and served in the Minnesota 1857-9. In 1861 he became lieutenant, and during the Civil War took part in the bombardment of Forts Jackson and St. Philip, the capture of New Orleans, and the destruction of the Confederate ram *Arkansas*. He was instructor at the naval academy 1867-8, in 1872 became commander, and in 1887 was placed in command of the *Omaha* in the Asiatic squadron. In 1895 he was made admiral, a member of the lighthouse board in 1898, and in July of the last named year was appointed to take charge of Admiral Cervera and other Spanish prisoners of war. Upon their return to Spain he was appointed superintendent of the Naval Academy.

Macomb, mā-koom' or mā-kōm', **Alexander**, American general: b. Detroit, Mich., 3 April 1782; d. Washington, D. C., 25 June 1841. He entered the United States army in 1799 as a cornet of cavalry, and at the commencement of the war with Great Britain in 1812 held the rank of lieutenant-colonel of engineers and adjutant-general of the army. In January 1814 he was promoted to be a brigadier-general and placed in command of that part of the northern frontier bordering on Lake Champlain. At Plattsburg, on 11 Sept. 1814, he sustained the attack of a greatly superior British force under Sir George Prevost, which, after the defeat of the British squadron on Lake Champlain on the same day,

retreated to Canada. For his firmness and courage on this occasion he was commissioned a major-general, and received the thanks of Congress and a gold medal. In 1835 he succeeded to the office of commander-in-chief of the army, which he held until his death. He wrote a 'Treatise on Martial Law and Courts Martial, as Practised in the United States' (1809).

Macomb, Ill., city, county-seat of McDonough County; on the Chicago, B. & Q. railroad; about 65 miles northwest of Springfield. It is situated in an agricultural region and in the vicinity are extensive deposits of fire-clay. The first permanent settlement was made about 1841, and the place was incorporated in 1857. The chief manufactures are sewer-pipe, stoneware, and pottery. There is considerable trade in farm products, coal, and lumber. The Western Illinois State Normal School is located here, and the free public library contains about 10,000 volumes. The government is administered, under a charter of 1872, by a mayor, who holds office two years, and a council. The city owns and operates the water-works. Pop. (1890) 4,052; (1900) 5,375.

Macon, mā'kōn, **Nathaniel**, American statesman; b. Warren County, N. C., 17 Dec. 1757; d. there 29 June 1837. He was educated at Princeton; in 1777 left college and served as a common soldier in the Continental army till the provisional treaty of peace in 1782, refusing any pay or military distinction. When the Constitution of the United States was submitted to the vote of the people of North Carolina, he firmly opposed it, on the ground that it bestowed too much power on the government, and made it in effect independent of the State. He never lost this dislike of the Constitution, and had unlimited confidence in the capacity of the people for self-government; his favorite saying being that "if left alone they would always do what was right." He was a member of the United States House of Representatives 1791-1815, and in 1816 was elected to the Senate, where he served till 1828, when he resigned his seat, having been then a member of Congress for 37 successive years.

Macon, Ga., city and county-seat of Bibb County, near the centre, one of the most important and rapidly growing business and manufacturing centres of the New South; 86 miles by rail from Atlanta, 136 from Augusta, and 197 from Savannah. It lies at the southeastern edge of the Appalachian mountain wall, on both sides of the Ocmulgee River; which pours from the upper plateau with a fall of about 90 feet in seven miles above the city, furnishing immense power soon to be developed by electric works to operate the manufactories. It is bridged here, but is navigable thence to its mouth all the year round, even at low water, for steamers of three feet draft. Macon is the greatest railroad centre in the State except Atlanta, six lines converging there,—the Southern, Central of Georgia, Georgia Southern & Florida, Macon & Birmingham, and Macon, Dublin & Savannah,—making eleven lines radiating from it. By through traffic arrangements it is also a part of the Seaboard Air Line, Atlantic Coast Line, and Louisville & Nashville, parlor and sleeping cars running from Macon to all; 60 passenger trains a day leave the union station.

Macon lies in the midst of a fast developing cotton district, as well as one of fruit and vegetables, making it a great agricultural market; near hardwood and yellow-pine forests, hills of granite, and deposits of brick and fire clays and the finest kaolin for porcelain, all, with the cotton, furnishing raw material for its important manufactures. In more detail it is the fourth inland cotton market of the United States, only Houston, Memphis, and Augusta (Ga.) exceeding it; and handles over 200,000 bales a year, valued at over \$6,500,000. It is at the edge of the Georgia peach belt, and sends away over 2,000 car-loads a season; in pears, plums, strawberries, and raspberries, besides grain and garden vegetables, it also does a great shipping as well as domestic business. But it is in manufacturing that its growth is most rapid and significant: with the attendant business accessories and banking facilities there has been a complete revolution in the past half dozen years. In 1900, it had 182 establishments, employing \$5,076,005 capital and 3,963 workmen and clerks, paying \$1,047,437 in wages, and turning out \$6,495,767 in product; in 1903 the last three items must have at least 50 per cent added, and the first be heavily increased. By far the greatest of these was then the cotton manufacture, in which Macon was taking a high place and promising to rival the great Northern seats of the manufacture: in 1900 its product was \$1,237,125, and it had increased 25 per cent within the year. Every branch of the industry is represented,—yarn, duck, cordage, twine, hosiery, and knit underwear; and it employed about a fourth of the total city wage-earners. Second only to this at present, if second, is the manufacture of cottonseed-oil for table use and packing, cottonseed meal and cake for provender and fertilizer, compound lard, plantene, and soap from the oil. This is a great and rapidly growing industry throughout the State, the seed netting the farmers half as much as the fibre; and Macon has an enormous plant started in 1896. The railroad shops which the many lines have located here turned out some \$500,000 of product. Next to these in volume were lumber and planing-mill products, sash, doors, blinds, and interior finish, with a market in all the States east of the Mississippi; the present output is fully \$500,000 a year. The largest vein of kaolin in the country, 30 miles wide and 35 to 70 feet deep, lies within seven miles of Macon; four companies, all established since 1900, are mining this to the extent of probably \$250,000 a year, and another has recently been organized. Brick and tile, paving and roofing materials, are all part of the products of the various fine clays. Foundry and machine-shop products, agricultural implements, sewing-machine findings, carriages and wagons, furniture, barrels and firkins (especially for the great oil and lard product), brooms and brushes, saddlery and harness, confectionery (a great specialty, four factories producing some \$200,000 worth a year), malt liquors, patent medicines, and artificial ice are a part of the thronging industries. The banking business for 1902 was about \$120,000,000 in the gross, and the clearing-house totals over \$40,000,000, a greater amount than in several Northern places of much greater population. The money-order business is about \$500,000 yearly, an increase of 20 per cent in three years.

MACON — MCPHERSON

The city is on elevated sandy ground, with excellent drainage and sanitary conditions, and a mild even climate. It is a notably handsome place, with immensely wide streets,—100 to 180 feet,—beautifully shaded; Vineville, a part of the city, in the rear is covered with costly residences, and furnishes a noble view of the city. Central City Park with fair grounds, fully equipped, was laid out in 1870 at large cost; there are also Tatnall, Daisy, and Chickamauga parks. Rose Hill Cemetery, half a mile down the river, containing 150 acres, is of widely famed beauty. There are very interesting Indian mounds in the vicinity. It has good trolley service; and an excellent water supply from the Ocmulgee River. There are two daily papers and two public libraries; Mercer University (Baptist, 1831), Wesleyan Female College (1836, the first chartered in the country), St. Stanislaus College (Roman Catholic, preparatory for the priesthood), Mt. De Sales Academy (Roman Catholic), Home for Aged Masons, and the State Academy for the Blind (1852), with a library of several thousand volumes. There is a government building, an Academy of Music, and several charitable institutions. It is governed under the charter of 1893, with a two-year mayor and a one-chambered council. Population in 1850, 5,720; 1860, 8,247; 1870, 10,810; 1880, 12,749; 1890, 22,746; 1900, 23,272, of whom 11,561, or about half, were colored. By an act of the General Assembly at its last session, two of the principal suburbs were annexed, making the population 30,000. With other suburbs between which and the city proper is only an imaginary line, the population is 45,000.

Macon was settled about 1822, incorporated as a town in 1823, and received a city charter in 1832. It was named after Nathaniel Macon (q.v.) of North Carolina.

BRIDGES SMITH,
Mayor of Macon.

Macon, Miss., city, county-seat of Noxubee County; on the Noxubee River, and on the Mobile & Ohio railroad; about 108 miles east by north of Jackson. The agricultural lands surrounding the city are almost wholly used for the cultivation of cotton. It has cottonseed-oil mills, cotton gins, and cotton compress. Its trade is chiefly in cotton. Pop. (1900) 2,057.

Macon, Mo., city, county-seat of Macon County; on the Wabash and the Chicago, B. & Q. R.R.'s; about 20 miles north of Moberley. Surrounding the city is a fertile agricultural region, well watered and well wooded; and in the vicinity are coal fields. The industrial establishments are foundries, machine-shops, flour-mills, wagon and carriage factories, brick yards, cigar factories, and works where dishwashing machines, shears, and agricultural implements are made. Some of its public buildings are the court-house, the county insane asylum, public and private school buildings. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 3,371; (1900) 4,068.

Macoun, ma-koon', John, Canadian botanist: b. Ireland, 1832. He removed to Canada at 18 and from 1868 to 1879 was professor of botany and geology in Albert College, Belleville, Ont. In 1882 he became botanist to the Geological and Natural History Survey of Canada and,

in 1887 assistant director. He has published 'Manitoba and the Great Northwest' (1882); 'The Forests of Canada and their Distribution' (1895).

Macpherson, māk-fēr'son, Sir David Lewis, Canadian statesman: b. Inverness, Scotland, 12 Sept. 1818; d. 16 Aug. 1896. He was educated at the Royal Academy in his native town, removed to Canada in 1835 and after becoming in 1842 a partner in a forwarding firm in Montreal secured in 1851, with others, a charter for a railway from Montreal to Kingston, the beginning of the Grand Trunk railway. In 1872 he became president of the Inter-oceanic Railway Company. He sat in the Legislative Council of Canada 1864-7, and in the last named year entered the Dominion Senate and was elected its Speaker in 1880. He was minister of the interior 1883-5 and was knighted in 1884.

McPherson, Edward, American journalist: b. Gettysburg, Pa., 31 July 1830; d. there 14 Dec. 1895. In 1848 he was graduated from the University of Pennsylvania, and although he studied law, soon gave it up for journalism. He sat in Congress 1858-66, was clerk of the House of Representatives 1863-73, 1881-3, and 1889-91, in 1876 permanent president of the National Republican Convention, and was chief of the bureau of engraving and printing in Washington 1877-8. He edited the *Philadelphia Press* 1877-80, was for some years the American editor of the 'Almanach de Gotha,' edited from 1872 a biennial 'Handbook of Politics,' and edited the 'New York Tribune Almanac' from 1877 till his death. He was the author of a 'Political History of the United States during the Great Rebellion' (1865); and 'The Political History of the United States during Reconstruction' (1870).

Macpherson, James, Scottish author and translator: b. Inverness-shire 1736; d. 1796. He studied at Aberdeen and Edinburgh. Having published 'Fragments of Ancient Poetry,' translated from the Gaelic or Erse language, a subscription was raised to enable him to collect additional specimens of national poetry. He produced, as the fruit of his researches, 'Fingal, an Ancient Epic Poem,' translated from the Gaelic (1762, quarto); 'Temora and other Poems' (1763), professedly translated from originals by Ossian, the son of Fingal, a Gaelic prince of the 3d century, and his contemporaries. The question of the poem's authenticity gave occasion for violent controversy. From the evidence of the contending parties it may be concluded that Macpherson's prose epics were founded on traditional narratives current among the Highlanders; but the date of the oldest of their lays is comparatively modern, and it is now impossible to ascertain the precise extent of his obligations to Gaelic bards. He had a life allowance from the government, and was agent to the Nabob of Arcot, having also a seat in the House of Commons 1780-90. He was also the author of a very inadequate prose translation of Homer's 'Iliad' and of some other works.

McPherson, James Birdseye, American soldier: b. Sandusky, Ohio, 14 Nov. 1828; d. Atlanta, Ga., 22 July 1864. He was graduated from West Point in 1853. Appointed brevet 2d lieutenant of engineers, he was assistant instructor of practical engineering at West Point,

1853-4, and after serving on fortification and construction duty, 1854-61, applied for active employment in the field at the opening of the Civil War. In May 1862 he was appointed brigadier-general of volunteers and was with Halleck at the siege of Corinth. For his services on this occasion he was made major-general of volunteers in the following November. He took an important part in the siege and capture of Vicksburg and was in consequence promoted to brigadier-general in the regular army 1 Aug. 1863. In March 1864 he was made commander of the department and army of the Tennessee and performed distinguished services in the campaign of Georgia. In the following July he commanded in the engagements around Atlanta and was killed during a reconnaissance.

McPherson, Kan., city, county-seat of McPherson County; on the Union P., the Atchison, T. & S. F., the Missouri P., and the Chicago, R. I. & P. R.R.'s; about 150 miles west by south of Topeka. The city is the trade centre of an extensive agricultural region in which the chief products are wheat and corn. It has flour-mills, creameries, grain-elevators, brick and lumber yards. Its trade is chiefly in farm and dairy products and in live-stock. Its principal buildings are a court-house, high school, and opera house. It is the seat of the McPherson College, under the auspices of the German Baptists. Pop. (1890) 3,172; (1900) 2,996.

McQuaid, Bernard John, American Roman Catholic prelate: b. New York city 15 Dec. 1823. He pursued part of his studies in Canada, but completed his classical course at Saint John's College, Fordham, N. Y., where he was graduated in 1843, and for the next three years held the position of tutor. He studied theology first with the Lazarists of New York city and later at Saint John's College, Fordham, being ordained priest January, 1848. Having built churches at Morristown and Springfield, N. J., he was engaged upon one at Mendham when summoned to the newly created diocese of Newark, N. J., 1853. In 1856 Father McQuaid founded Seton Hall College at Madison, N. J., and was its first president, retaining the office for ten years, and its subsequent success has been eminently due to his indefatigable efforts. He was consecrated first bishop of the diocese of Rochester, N. Y., by Archbishop McCloskey in New York city 12 July 1868. With characteristic energy he has discharged his episcopal duties, the cause of Catholic education ever appealing to him as one of paramount importance. With a view to advancing it he invited the Sisters of Saint Joseph to conduct new parochial schools in his diocese and likewise founded Saint Andrew's Preparatory Seminary. The parochial schools of his diocese have a larger attendance in proportion to the Catholic population than that of any other diocese in the United States. He is spiritual adviser of the Ladies' Catholic Benevolent Legion. His diocese now (1905) comprises a Catholic population of 110,000; 142 priests; 122 churches; 1 theological seminary; 1 preparatory seminary; 45 parochial schools; 4 orphanages; 2 hospitals, etc.

MacQueary, ma-kwě'rĭ, Thomas Howard, American educator: b. Charlottesville, Va., 27 May 1861. He was graduated from the Episcopal Theological School at Alexandria, Va., in

1886, took orders in the Episcopal Church and in 1882 became rector at Canton, Ohio. His religious views having undergone a radical change he was tried by an ecclesiastical council for denial of miracles and suspended from the ministry for six months. He accordingly resigned from it in September 1891, and was for some time in the Universalist ministry. He founded Unity House Social Settlement in Minneapolis, and since 1900 has been superintendent of the Parental School in Chicago. He is the author of 'The Evolution of Man and Christianity' (1889), the immediate cause of the accusation of heresy which was brought against him, and 'Topics of the Times' (1890).

Macquoid', Katherine Sarah Thomas, English novelist: b. Kentish Town, London, 26 Jan. 1824. She was married to T. R. Macquoid, a water-color artist, in 1851. Besides many pleasing volumes of travel, such as 'Through Normandy' (1874); 'Through Brittany' (1877); 'In the Ardennes' (1881); 'About Yorkshire' (1883); 'In the Volcanic Eifel,' with her son, Gilbert Macquoid (1896), she has written a long series of novels, not a few of which have been widely read in the United States. Among these may be cited: 'Patty' (1871); 'In the Sweet Spring Time' (1880); 'Little Fifine' (1881); 'At the Red Glove' (1885), by some critics considered her best work; 'The Haunted Fountain' (1890); 'His Last Card' (1895). Her volumes of travel are illustrated by her husband.

Macrauchenia, māk-râ-kě'nĭ-a, a genus of fossil South American herbivorous animals, forming a connecting link between the palæotherium and the camel family; in form they nearly resemble the llama, but were as large as a hippopotamus. Their remains have been gathered nearly completely from the Pampas formation of Argentina and Bolivia.

Macready, ma-krě'dĭ, William Charles, English tragedian: b. London 3 March 1793; d. Cheltenham 27 April 1873. He received his education at Rugby, and originally had the intention of adopting one of the learned professions. The change in his career was brought about by his father, a theatrical manager, having fallen into embarrassed circumstances, to relieve which he joined his father's troupe, then acting at Birmingham. He appeared there for the first time in 1810 in the character of Romeo, in which he was successful. On 16 Sept. 1816 he made his first appearance on the London boards, acting Orestes in 'The Distressed Mother,' at Covent Garden Theatre. He did not achieve an immediate triumph in London, but gradually rose in popular favor. His *Virginius* was the first of his London successes. From the time when he appeared in this part he continued steadily to improve as an actor, and his successes were no longer confined to the lower walks of the profession. In 1842 he became a theatre manager at Drury Lane, but met with no success, so that he resigned at the end of the second season. His managership at Drury Lane had brought upon him considerable loss, to repair which he visited America (1840). On his return to London he gave some farewell performances, and then retired from the stage in 1851.

Macrobius, mā-krō'bī-ūs, **Ambrosius Aurelius Theodosius**, Latin author of the 5th century A.D. The country of his birth is uncertain, but it is inferred from the fact that he speaks of Latin as a foreign tongue to him, that he was probably a Greek. He was the author of a miscellaneous work entitled 'Saturnalia,' curious for its criticisms, and valuable for the light it throws upon the manners and customs of antiquity; a commentary on Cicero's 'Somnium Scipionis,' in two books, valuable for the exposition it affords of the doctrines of Pythagoras with respect to the harmony of the spheres; and a treatise, 'De Differentiis et Societatibus Græci Latiniq. Verbi.' Consult Von Jan, 'Macrobius'; and Eyssenhardt, 'Macrobi Opera.'

Mac'rocsm. See MICROCSM.

Macrotherium, a genus of extinct ungulate mammals, in some cases of gigantic size, found most completely in the Miocene deposits of Europe, but also known from China and western North America. It represents the primitive group *Ancylopoda*, which had a wide geographical range in the Miocene and Pliocene epochs when it became extinct. The structure of the curiously twisted feet so much resembles that of the ground-sloths that for a long time the macrotheres, as well as their companion, but more generalized genus *Homalodontoitherium*, were regarded as edentates. Consult Woodward, 'Vertebrate Palæontology' (1898).

Macru'ra. See DECAPODA.

MacVeagh, māk-vā', **Wayne**, American lawyer and diplomat: b. Phenixville, Pa., 19 April 1833. He was graduated from Yale in 1853 and after studying law was admitted to the bar in 1856. He was district attorney of Chester County 1859-64, became prominent as a Republican leader, and conspicuous in his profession, and in 1870-1 was minister to Turkey. He was an active opponent of "machine politics" and in 1872 led the Republican opposition to Simon Cameron, his father-in-law. He was chairman of the "MacVeagh Commission" sent by President Hayes to Louisiana in 1877 to act as the President's unofficial representative and aid in adjusting political differences there. He was attorney-general of the United States, March to September 1881, and was ambassador to Italy 1893-7.

McVickar, māk-vīk'ar, **William Neilson**, American Protestant Episcopal bishop: b. New York 19 Oct. 1843. He was graduated at Columbia College (1865); and at the General Theological Seminary (1868). He was ordained-deacon (1867) and priest (1868). Being elected coadjutor bishop of Rhode Island, 19 Oct. 1897, he was consecrated 27 Jan. 1898, and on the death of Bishop Thomas March Clark, September 1903, succeeded to the see.

Ma'cy, Jesse, American historian: b. Henry County, Ind., 21 June 1842. He was graduated from Iowa College in 1873, and has been a member of the faculty there since that date, becoming professor of constitutional history and political science in 1885. He has written 'Civil Government in Iowa' (1881); 'Institutional Beginnings in a Western State' (1883); 'Our Government' (1886); 'A Government Text-Book for Iowa Schools' (1887); 'The English Constitution' (1897); 'Political

Parties in the United States, 1846-1861' (1900); and numerous magazine articles.

Mad Anthony, a nickname given to the Revolutionary general Anthony Wayne (q.v.) on account of the seeming recklessness of his brilliant military feats.

Mad Apple, the fruit of an American nightshade, especially that called Sodom apple (*Solanum sodomia*), the eating of which produces poisonous intoxication.

Mad Mull'ah, term applied to Mohammed Ali, the Mahdi, or Moslem Messiah: b. Somaliland 1843; d. 1884. In his youth Mohammed was initiated into the mysteries of the occult sciences and sorcery. These he learned among the tribe of the Danakil, which has always been renowned for its magicians. A study of the Koran and the Arab writings followed in the Marabout school. When quite young the future Mullah was taken with the idea of making the pilgrimage to Mecca, and not content with one journey made the sacred visit three or four times. His object was to obtain a greater reputation for holiness than that held by the other pilgrims.

After his last pilgrimage Mohammed returned to Berbera, but met with small success in that commercial town. Seeing no prospect before him but that of remaining a poor, begging pilgrim, he determined to strike out a new line for himself, and established himself among a powerful inland tribe. Here he made his position secure by his appearance of holiness, his impressive airs, and the assurance with which he made his prophecies. At this time and hereafter the magic learnt in his boyhood stood him in good stead whenever his holiness was not able to overawe his somewhat turbulent followers. He assumed the title of Mullah (priest and heaven-sent), and even that of Mahdi (prophet). Overwhelmed with presents by his credulous followers, he was soon among the richest of the land, and with his riches his influence grew apace.

His pride waxed very great, and one day he ordered all the Korans of the ordinary priests to be burned, saying that he himself was the living Koran, and that he was to be obeyed as a new prophet sent from Allah. Not content with persuasion, the Mullah, following the example set by Mohammed the Great, threatened with death all those who disbelieved, and in following up these threats caused the disturbances which brought about the Somaliland campaign. Possessing the power of calling forth the enthusiastic support of the tribesmen, the Mullah has not had to rely upon himself alone for the conduct of his campaigns. If report speak truly, besides the Austrian, Karl Inger, he had as lieutenant an English naval officer. In 1881 he destroyed the Egyptian army despatched against him. He died of smallpox. See EGYPT, SUDAN.

Consult Darmesteter, 'The Mahdi' (1885); Hoffmann, 'Mahdithum' (1899); E. Müller, 'Beiträge zur Mahdilehre des Islams' (1901).

Madach, mō'däch, **Emerich**, Hungarian poet: b. Also-Sztrégova 21 Jan. 1823; d. there 5 Oct. 1864. He studied law, was a notary in his native country, and was also active as an orator and journalist. He wrote on archeology and æsthetics; and both lyric and dramatic verse. His principal works are the two dramatic poems, 'Moses' (1860); and 'The Tragedy of Man'

MADAGASCAR

(1860). The latter owes much to 'Paradise Lost,' and to 'Faust,' but is yet a remarkable performance. Though strongly contemplative in character, it was successfully presented to Austria and Hungary in 1830. There is an excellent rendering in German by von der Lech (1888). Consult: Fischer in 'Auf der Höhe,' Vol. XVI. (1885).

Madagascar, *mā-d-gās'kar*, an island in the Indian Ocean, since 1896 a French colony. It is separated by the Mozambique Channel from the southeast coast of Africa, the nearest point being 230 miles distant. It is 975 miles long from Cape St. Mary in the south to Cape Amber in the north, has an average breadth of 250 miles, and an estimated area of 227,750 square miles, being after Greenland, New Guinea, and Borneo, the fourth largest island in the world.

Topography.—Madagascar consists of an elevated region with an average height of from 3,000 to 5,000 feet overlooked by mountains rising in some cases to nearly 9,000 feet above the sea-level. This plateau occupies a much larger proportion of the surface in the north and east than in the west and south, and the greater portion of the island south of lat. 23° S. belongs to a much lower region which does not consist entirely of plains, but is interrupted toward the west by three prominent chains of hills stretching from north to south, one of them apparently in a continuous line about 600 miles in length. The coast exhibits a number of indentations, mostly small, but few good harbors, being in great part rock, though in some places low and sandy.

Hydrography.—The rivers are numerous; few of them offer the advantages of internal navigation. The chief rivers have their courses on the west and northwest sides of the island. The Betsibóka with its affluent the Ikiopa, unitedly measuring 300 miles, may be ascended by light steamers for 100 miles; the Tsiribihina has a somewhat shorter course, but drains by its numerous tributaries a much larger area. The eastern rivers descend from the high land through magnificent gorges, forming a succession of rapids and cascades, the falls in some instances having a descent of 500 feet. There are few lakes of any size as yet known to explorers; one of the largest is Alaotra Lake, measuring 25 miles long; the others do not reach a length of 10 miles. A long chain of lagoons having very short distances between each and often expanding into wide sheets of water stretches for nearly 300 miles along the east coast.

Geology.—Geologically the elevated region consists almost entirely of granite and other igneous rocks, while the lower region is composed chiefly of secondary formations. The former region is traversed by a line of extinct volcanic craters, some of which show signs of comparatively recent activity. Among the more remarkable fossils are remains of a huge struthious bird, the Epiornis, whose egg, measuring 12 by 9 inches, is larger than that of any other known bird. The minerals include iron in abundance, gold, lead, and copper, all more or less worked, while in the northwest coal is found.

Climate.—The climate is various; the heat on the coast is often very intense, but on the high lands of the interior the temperature is more moderate. On the coast the rains are nearly constant, beginning in the evening and sometimes

lasting all night; in the interior the winter is dry and agreeable. The greatest amount of rainfall takes place on the east coast, and especially on the northeast, the part directly exposed to the summer monsoon. The elevated region of the interior and the districts on the west coast are tolerably healthy for Europeans, but owing to the large extent of marsh and lagoon on the east, malarial fever prevails, and is frequently fatal to natives from the interior as well as to Europeans. Snow is never found on even the loftiest mountains.

Ethnology.—The inhabitants, known by the name of Madagasy, belong to the Malayo-Polynesian stock and speak a Malayan language. They appear to form substantially a single race, though they have received a considerable intermixture of African blood and a certain amount of Arab intermixture. They are divided into numerous tribes, each having a distinctive name and customs. The Hovas are the predominant tribe; their proper country is the elevated region of the interior, but they extended their sway over nearly the whole island. Among the other chief tribes are the Betsimasaraka on the east coast, the Betsileo in the south central region, and the Sakalava on the west and north. The people are socially divided into three classes: Adrians or nobles, Hovas (in a special and restricted use of the word) or free commoners, and Andevos or slaves. This last section consists, or till recently consisted, partly of debtors and criminals and their descendants, partly of Africans brought over in slave-shows, and partly of the descendants of other tribes conquered by the Hovas. The Africans were, however, formally set free in 1877. In the coast districts the houses of the better class are built of framed timber with lofty roofs covered with shingles or tiles; the dwellings of the lower classes are constructed of bamboo or rushes, or even of clay. In former and more unsettled times the villages were almost always built on the tops of hills, but during the 19th century this precaution has not been deemed so indispensable.

Flora.—The most striking feature in the vegetation is a belt of dense forest with an average breadth of 15 to 20 miles passing round the whole island, and broken only by a gap in the northwest, where the two ends of the forest overlap. It is found at all levels from 6,000 feet to the water's edge, which it touches on the northeast, where it reaches its greatest breadth of 40 miles. The trees of this forest include many species of lofty palms, hardwooded exogens supplying a great variety of beautifully veined and durable timber, and a large number of trees remarkable for the splendid character of their blossoms. Of all the trees of Madagascar the most striking is the ravnala or traveler's-tree (*Urania speciosa*); it resembles a palm, its stem being crowned by a semicircle of oblong leaves spread out vertically in a fan shape. It owes its name to the fact that the traveler may supply himself with water from it by piercing or breaking the lower ends of the leaf-stalks.

Fauna.—Madagascar has a singularly local fauna which, although upon the whole related to Africa, is so peculiar to itself that with a few neighboring islets, it forms a very distinct sub-province of the African region. Its characteristics show plainly that the separation of the

MADAGASCAR

island from the continent occurred at a very ancient time. Another singular feature is the presence of various forms of animal life represented elsewhere only in Oriental Australian regions, with a marked resemblance in a few animals, for example the boas, to South America. From this it is plausibly argued that in early Tertiary times there was a land connection between Madagascar and India and the region thence to Australia, now presented only by the islands of the Malayan Archipelago. (See LEM-URIA.) In its mammals Madagascar is singular in what it lacks, as well as in its possessions. It has none of the cattle, equine animals, elephants, rhinoceroses, hogs or even rodents of Africa, except a mouse or two; no lion or true cat or dog of any kind; and no monkeys. On the other hand it has several small insectivora, closely allied to tropical American species; the great majority of all the lemurs, the few outsiders being in Africa and the Orient; and several viverrine quadrupeds, which there take the place of the predatory cats. The modern birds are less striking in their peculiarities, but in the zoological era immediately preceding the present the island possessed those huge ratite birds, the epornis and its relatives, which gave rise to the story of the roc. Many forms of huge land tortoises were also members of this singular fauna. The fishes, amphibians, reptiles, and lower forms are largely peculiar.

Crocodiles are numerous in the rivers and lakes, and many species of lizards, chameleons, and tree-frogs abound in the forests. Among the insects are numerous brilliantly colored beetles, butterflies, moths, flies, locusts, and spiders, venomous species of the latter as well as scorpions and centipedes being present. See ZOOGRAPHY.

Agriculture.—Of the vegetable products grown for food by far the most important is rice, the staple food of the inhabitants; next in importance come manioc or cassava, sweet-potatoes, beans, tomatoes, ground-nuts, and yams. Ginger, pepper, and indigo grow wild in the woods; cotton, sugarcane, coffee, tobacco, and hemp are cultivated. Humped cattle are found in immense herds, and form a large part of the wealth of the inhabitants; they appear to have been introduced from Africa at a remote period, as the fat-tailed sheep, goats, swine, and horses have been more recently. Under French administration agriculture and cattle-raising are undergoing considerable extension. General Gallieni, the military governor, foreseeing that, for want of French colonists, Madagascar was likely to become a burden on the hands of France, devised a plan in 1899 to hasten the settlement of the country, the efficiency of which has since been proved by practical tests. The country not being thoroughly pacified, a large army of occupation is garrisoned there. Upon the expiration of their terms of enlistment these men are offered large land grants and an annual subsidy from the French government of 2,250 francs (\$434) for two consecutive years. In return for these privileges these settlers pledge themselves to reside three consecutive years on the territory allotted to them. During this period they are to cultivate the soil to the best of their ability. They are furthermore obliged to hold themselves in readiness to aid in the defense of the settlements against hostile natives. This experiment was begun with 36 men

honorably discharged from the army, their concessions aggregating 8,000 acres, and two years later the issue of the official report of the transactions of the colonial office showed that the plan was successful. Under the intelligent guidance of agricultural experts the country was planted with the staples for cultivation to which it was best adapted, and many of the successful farmers after the first year sent to France for their relatives.

Commerce and Industries.—Rice, cattle, hides, gum, india-rubber, wax, cotton, sugar, vanilla, lard, coffee, gold, gum-copal, and dyewoods are exported. The chief imports are cotton goods, wines and spirits, metals, rice, and flour. In 1901 the total value of imports was \$9,206,552, of exports \$1,995,995; the value of the gold exported being \$660,000. In general the Malagasy show much aptitude for the manual arts. As silversmiths, gunsmiths, and carpenters, they rapidly acquire the skill of Europeans; and with hand-loom the rudest construction the only ones as yet in use, they make excellent and handsome cloths. The principal article of native dress with both sexes is the *lamba*, a piece of cloth about three yards long and two broad, which is folded round the body above the arms, one end being thrown over the shoulder.

The island is being rapidly opened up by the building of highways, a carriage road, and a railroad having been completed between Tananarive, the chief port and capital, and Antananarivo (q.v.), the ancient capital.

Government.—Prior to 1895 the government was a native absolute monarchy. A French Resident, however, with a military escort, resided at the court and controlled foreign relations, so that the country was virtually a French protectorate. Much friction prevailed in 1893-4, between the government and the French authorities, and finally France decided to make her protectorate of the island effective. An expedition easily overcame the resistance of the Hova troops, and after some changes in the formation of the administration the island was made a French colony, and General Gallieni was appointed resident-general and commander-in-chief in September 1896. His vigorous and determined policy made a great improvement in the condition of the country. He is assisted by an administrative council, and natives are largely employed in the civil and military administration. An educational system provides primary schools for boys and girls, four normal schools, a school of practical agriculture, two regional schools for agriculture and industries, and a school of medicine. Numerous Catholic and Protestant mission schools have long been established in the island. The religion of the great bulk of the people is a kind of fetishism or worship of charms. Many of their superstitious customs have been abolished and Christianity adopted, chiefly by the Hovas, the Catholic cult prevailing. A court of appeal and tribunals throughout the provinces provide for native justice, while there are special courts for the administration of French justice. The local revenue is derived chiefly from direct taxation, from customs and other indirect taxes, from colonial lands, posts and telegraphs, markets, etc., and from subventions granted by France. The chief branches of expenditure are general administration, public

MADAME BOVARY—MADDOX

works, post-office, and public debt, the latter being a large item.

Population.—According to the census of 1901, the population amounted to 2,505,237, of whom 2,488,689 were natives, 15,524 European, 1,006 Asiatic and African; the Hovas, the chief native tribe, numbered 850,000.

History.—Madagascar was known to the traveler Marco Polo at the end of the 13th century and had been visited for several centuries by the Arabs. In 1506 it was visited by the Portuguese, who gave it the name of St. Lorenzo. Toward the end of the 17th and during the most of the 18th century the French endeavored to form military stations on the east coast, but with no lasting results. A settlement was established at Fort Dauphin in the southeast and held for some time, but in consequence of the tyrannical behavior of the French settlers they were massacred by the natives and the place destroyed. The French, however, struggled hard and successfully to retain the islands of Ste. Marie on the east coast and Nossi-bé on the northwest. Previous to 1810 Madagascar might be said to have been divided among numerous petty chiefs, almost constantly at war with each other. In that year, however, Radama I., a prince of remarkable intelligence, became king of the Hovas, and began to enforce a claim by right of conquest to the sovereignty of the whole island. He saw that if his people were to be prosperous they must first be educated and civilized. In return for the promise of co-operation in putting down the slave-trade on the coast of Mozambique, he received arms and other assistance from the British, by which he was enabled to carry on his conquests. Christian missionaries began to teach in the capital in 1820, many converts were made, the Bible was translated into the Malagasy tongue, the language was first reduced to a systematic written form, and printing was introduced. Great improvements had taken place in the manners of the people when Radama died in 1828, and was succeeded by his chief wife, Ranavalona, a woman of cruel disposition, and opposed to all innovation. The native converts were persecuted, many of them being put to death, and the island was closed to Europeans. This reign of terror ended at last in 1861, when the queen died, and was succeeded by her son Radama II., who, himself a Christian, reopened the island to European missionaries and traders, and proclaimed the emancipation of the African slaves. He appears, however, to have been a weak prince easily swayed by native and foreign favorites, and he unwisely granted extensive territories and privileges to an enterprising French company, an act which lost him the affection of his nobles, and led to his assassination in 1863. His wife Rasoherina was placed on the throne, and the government repudiated the concessions made to the French, offering 1,000,000 francs as compensation. After a quiet and prosperous reign of five years this queen died, and was succeeded by Ranavalona II. in 1868. After she had been elected queen she and a great number of her courtiers became Christians, and many reforms favorable to enlightenment and humanity were perseveringly carried out. She was succeeded in 1882 by Ranavalona III., when the French brought forward their claims on the Malagasy territory, which being refused, led to hostilities in 1883-5. This war was termi-

nated by a treaty, under which France acquired protectorate rights over Madagascar; but hostile feeling toward the French again led to war in 1895, with the result that the queen was deposed and exiled first to the island of Réunion, and thence in 1899 to Algiers, while Madagascar became a French colony.

Consult: Dawson, 'Madagascar: its Capabilities and Resources' (1895); Keller, 'Madagascar, Mauritius and Other East African Islands' (1900).

Madame Bovary, mǎ-dǎm bō-vā-rē, a novel by Gustave Flaubert, which appeared in 1856, when the author was 35. It was his first novel, and is regarded as the book which founded the realistic school in modern French fiction—the school of Zola and Maupassant. The novel is a powerful, unpleasant study of the steps by which a married woman descends to sin, bankruptcy, and suicide. The time is the first half of the 19th century; the action takes place in provincial French towns.

Mad'den, Frederick William, English librarian: b. London 7 April 1839. He is a son of Sir Frederick Madden, a noted antiquary, and was chief librarian of the Brighton Public Library, 1888-1902. He is a member of various numismatic societies, and among other works has published 'Handbook of Roman Numismatics' (1861); 'History of Jewish Coinage and Money in the Old and New Testaments' (1864); 'The Coins of the Jews' (1881).

Mad'der, (1) in botany, the English name of the plants of the genus *Rubia*, especially *R. tinctorum*. It is a trailing or climbing annual, supporting itself by its leaves and prickles. It is supplied chiefly from Holland, France, Italy, and Turkey. The roots, which are ready the third year, are kiln-dried, and then threshed. They are then dried a second time, and afterward pounded and stamped in a mill. Indian madder, called also madder of Bengal, is *R. cordifolia*; madder of Chile *R. augustissima* or *Relbourn*. (2) In chemistry, the root of *R. tinctorum* is extensively used in dyeing for the production of a variety of colors, namely, red, pink, purple, black, and chocolate. Other species of *Rubia* are also used. It would appear that madder contains a colorific principle—rubian—which, under the influence of a peculiar ferment, termed erythrozym, breaks up into alizarin, purpurin, etc. The colors produced from madder are very stable, the well-known Turkey-red being one of them. Madder also contains certain yellow coloring matters, but they are useless, if not injurious, in the process of dyeing. (See DYES; DYEING.) (3) In pharmacy, madder is a tonic, a diuretic, and an emmenagogue. Brown madder, a rich red-brown pigment, prepared from the roots of *R. tinctorum*.

Mad'dox, Richard Leach, English physician and chemist: b. Bath, England, 4 Aug. 1816; d. Portsmouth, Southampton, 11 May 1902. He studied medicine at University College, London, but was graduated M. D. at Edinburgh. In early life he settled and practised his profession in Constantinople, and here first took up the study of photography. He subsequently left the Bosphorus for Smyrna and was a civil surgeon in the military hospitals at Scutari during the Crimean war, and finally settled at Woolston, near Southampton, England. It was during his residence at Woolston, which lasted until

MADEIRA — MADISON

1874, that he worked out the process which has revolutionized the art of photography, by substituting the gelatino-bromide for the collodion plate. With him originated the gelatino-bromide dry plates to take the place of the wet collodion plates which, besides other inconveniences, sometimes produce an atmosphere which is dangerous to the operator's health. There have been more than one claimant to the credit of this discovery, but it is decided by the 'Scientific American' that Dr. Maddox is entitled to all the honor of the invention. The sub-committee of the Committee of Sciences and Arts of the Franklin Institute of the State of Pennsylvania awarded him the Scott Legacy medal and premium as the author of the invention.

Madeira, ma-dē'ra (Port. mā-dā'ē-rā), a group of Atlantic islands belonging to Portugal, opposite and about 440 miles distant from Sali, Morocco, on the west coast of Africa, and about 600 miles southwest of Lisbon. Madeira, the principal island, and the islets of Porto Santo, Dezerta Grande, and Bugio, compose the group with an area of 505 square miles, and a population (1900) 151,125. The main island (area, 313 square miles) consists of a collection of mountains of volcanic origin, the most elevated of which is upward of 6,000 feet high. Through the west half of the island runs a central ridge about 5,000 feet high, on which is an extensive plain called Paul de Serra. The east portion of the island, though elevated, is less so than the west. From the central mass steep ridges extend to the coast, where they form perpendicular precipices of from 1,000 to 2,000 feet high. These cliffs are indented by a few small bays, where a richly cultivated valley approaches the water between abrupt precipices, or surrounded by an amphitheatre of rugged hills. These narrow bays are the sites of the villages of Madeira. The most striking peculiarity in the mountain scenery of the island is the jagged outline of the ridges, and the deep precipitous gorges which cut through the highest mountains almost to their very base. The road round the island is in many places exceedingly picturesque, being led often between lofty cliffs, or along the front of precipices overhanging the sea. The Madeiras were known to the Romans under the name of *Purpuraria Insula*. They were rediscovered by the Portuguese in 1420, and the name Madeira was given to the principal island from the magnificent forests of building timber (in Portuguese *madeira*) which then covered it. It was settled by the Portuguese in 1431. Funchal, the capital (pop. 1900 37,011), is an episcopal see. The mean annual temperature of Madeira is 65°, and the climate, from its constant and temperate warmth, is well known for its favorable effects on those suffering from pulmonary and other complaints, which renders the island a favorite resort of invalids from Britain and elsewhere. Large and well-appointed hotels exist at Funchal. The staple product of Madeira is wine, the quantity of which in good years prior to the appearance of the vine disease in 1852, amounted to 2,750,000 gallons. In 1898 there was an export of 587,000 gallons valued at about \$890,000. Sugarcane, and the cactus for the rearing of cochineal, are cultivated, fruit and vegetables are grown, fisheries are actively engaged in, linen, woollens, leather, straw hats, baskets, soap, sugar, spirits, butter, etc., are manufactured. A total of

1,635 vessels of 4,692,264 tons entered and cleared the island ports in 1899. The chief import is coal, the most important of the others being wheat, rice, Indian corn, and dry goods.

Madeira, or **Cayari**, Brazil, a large navigable affluent of the Amazon, about 800 miles long, formed by the united streams Beni, Mamore, and Guaporé, on the frontiers of Brazil and Bolivia. Just northeast of the frontier the navigation is interrupted by rapids, to avoid which a railway is being constructed. The length from the source of the Mamore is nearly 2,000 miles.

Madeleine, mād-lān, La, a church in Paris, in a square of the same name, commenced in 1764. It was remodeled and changed after the Revolution, and in 1832 was completed at a cost of \$3,000,000. The church is built in the form of a Roman temple and is 100 feet high, 354 feet long and 141 feet wide. The bronze doors by Triqueti are 35 feet high and 16 feet in width. The building, which has no windows, is lighted from above.

Madhava, mā'dha-va, another name of the Hindu god Vishnu (q.v.).

Mad'ia Oil, oil expressed without heat from the seeds of *Madia sativa*. It is transparent, yellow, odorless, and may be used on the table as a substitute for olive oil, or for oil-cake for cattle. The plant is a composite, native to southern South America, but has long been cultivated in Europe for its oil-bearing seeds.

Mad'ison, James, American Protestant Episcopal bishop: b. Rockingham County, Va., 27 Aug. 1749; d. 6 March 1812. He was graduated at William and Mary College in 1772, studied law, and was admitted to the bar, but soon after abandoned law for divinity. In 1773 he was chosen professor of mathematics in William and Mary College, and in 1775 went to England and was admitted to orders by the bishop of London. In 1777 he was elected president of the college, and during the American Revolution succeeded in keeping the college in active operation. Having been chosen as bishop of Virginia he was consecrated by the archbishop of Canterbury, in Lambeth palace, 19 Sept. 1790. He continued to discharge the duties of president of the college, and professor of natural and moral philosophy, international law, etc., with those of the episcopate, until his death. His only publications were several occasional discourses, and a 'Eulogy on Washington' (1800).

Madison, James, fourth President of the United States: b. Port Conway, Va., 1751; d. Montpelier, Va., 28 June 1836. Madison was the eldest son of James Madison, a Virginia planter, and of Nelly Conway, daughter of Francis Conway, of King George County, Va. His father, a man of independent means, lived on an estate now known as Montpelier in Orange County. James was born at Francis Conway's home on the Rappahannock while his mother was on a visit to her parents. His educational advantages were excellent for the times; he attended the school of a Scotchman, Donald Robertson, was well prepared for college by the clergyman of the parish, the Rev. Thomas Martin, and entered Princeton in 1769. His application to his studies was excessive, and was in part the cause of later ill health; he succeeded, however, in taking the studies of the last two years in one year and

MADISON

took his B. A. degree in 1771. He remained at Princeton for another year doing special work in Hebrew under Dr. Witherspoon, the president. After his return home he tutored his younger brothers and began a systematic course of reading in theology, philosophy, and law. At this time his study of Hebrew and theology seem to indicate a desire to enter the ministry, but he soon abandoned this and prepared himself for the legal profession and for public service. His theological studies bore good fruit later as is evidenced by the stand he took for religious liberty.

Madison was by instinct a politician and not a soldier; he took no active part in the Revolutionary War, but as early as 1774 he was appointed a member of the Committee of Public Safety for Orange County, and in 1776 was elected delegate to the convention which framed the constitution of Virginia. From that time until he retired from the Presidency he was honored with high public offices by his State and by the nation. In the Virginia Convention Madison succeeded in substituting for a clause in the Bill of Rights permitting the "fullest toleration" in religion, a clause allowing the "free exercise of religion." This was a distinct blow to religious intolerance for, as he said, toleration implies jurisdiction, and the State should have no coercive power over religious thought. He was a member of the first Virginia Assembly but failed of re-election because, as his biographer Rives tells us, he refused to conform to the universal custom of his day and "treat" his constituents; he was, however, made a member of the governor's council and so distinguished himself that in 1780 while still under thirty he was chosen as delegate to the Continental Congress. In this Congress he was conspicuous for his opposition to the issuance of paper money by the States; for his efforts to secure for Congress the right of taxing imports, and for his determined stand to retain for the States the right of navigation on the Mississippi. Madison saw clearly that a government so organically weak that it could not enforce its requisitions and could pay its debts only by increasing its debt could never be effective; hence he labored unceasingly to enlarge the power of the central government. The office of delegate was limited to one term, so Madison was not returned to Congress in 1784, but the high esteem in which he was held was shown by his immediate election to the State Assembly. Virginia was a very influential State and her attitude toward national questions was of great importance. In the Assembly Madison tried to indoctrinate the people of Virginia with his ideas concerning the Federal power. His bill to regulate trade in Virginia and to provide ports of entry led first to the conference between Virginia and Maryland with reference to trade on the Potomac and later to the Annapolis Convention which met in 1786 to consider the trade and commerce of the United States. This Convention at Annapolis urged upon the States the appointment of commissioners to meet in convention at Philadelphia "to devise such further government as shall appear to them necessary to render the Constitution of the Federal Government adequate to the exigencies of the Union." The summoning of the Philadelphia Convention was largely due to the wise bills introduced by Madison in the Virginia Assembly and to his direction of public sentiment, and it was eminently fitting that he

should be one of the delegates of the Virginia Commission at whose head was George Washington. Madison's views on government are clearly defined in his "outline system" which formed the basis of the Virginia plan proposed to the Convention. His system demanded that there should be a due supremacy of national authority without the exclusion of local authority, that the national authority should extend to the judiciary and to the militia; that the national legislature should be composed of two bodies, the larger elected for a short, the smaller for a longer term; that Congress should have certain coercive powers; that a national executive should be provided and that the basis of representation in Congress should be changed from States to population. The "Virginia plan" was the germ of the Constitution and Madison is rightly called the "Father of the Constitution." His arguments in favor of the proposed government were exhaustive and convincing, and his private notes of the work of the convention and of his debates purchased from his widow and published by Congress form a valuable addition to our knowledge of this stormy period. While the Constitution was before the people for consideration Madison, Hamilton and Jay wrote a series of papers called in collected form 'The Federalist,' in which they discussed government in general, defined the character of the proposed union, met objections, and proved the advantages to be derived from effective central government. Madison was a member of the Virginia Convention which met to consider the ratification of the Constitution and by his keen analysis and clear cut argument contributed more than any other man to secure its adoption. His chief opponent was Patrick Henry; his ablest ally, John Marshall. Owing to Henry's antagonism, Madison was defeated as candidate for the Senate, but was elected as representative to Congress and took his seat in April 1789. During this session of Congress Hamilton and Madison, who had hitherto been at one in their efforts to centralize power, drifted apart, and Madison gradually began to endorse Jefferson's position as to certain inalienable States rights. There is no reason to accuse him of bad faith; his statesmanship was never overbold, and Hamilton's commercial system, his extensive financial schemes, especially the funding of the national debt and the assumption of State debts by the general government, gave so much power to Congress that Madison withdrew his support from the Secretary of the Treasury and vigorously opposed his measures. Although Madison had now definitely cast in his fortunes with the republican opposition his moderation and good sense enabled him to retain the friendship of most of his political opponents.

From 1793 to 1796 the country was greatly agitated over the relation of the United States toward France, and on the outbreak of war between France and England the President issued a neutrality proclamation to the great disgust of the French, who had expected active friendship from the United States. Although both countries interfered shamefully with American commerce, popular sentiment and the Republican party sided with France. In 1794 Madison, supported by Jefferson, introduced a bill demanding retaliatory measures against Great Britain, and a temporary embargo was laid on British commerce. The signing of the Jay treaty by the President was a signal for an outburst of popu-

JAMES MADISON,
4TH PRESIDENT OF THE UNITED STATES.

MADISON

lar indignation, and Madison, as leader of the opposition in Congress, opposed the appropriation of money to carry out the terms of the treaty. In 1797 Madison retired and enjoyed for a short while the pleasures of private life. A year later he was aroused to activity by the passage of the unpopular Alien and Sedition Acts. The Virginia resolutions written by Madison denounced these laws and declared that in case of a dangerous exercise by the Federal government of powers not granted by the compact the States had the right to interfere. These resolutions still further emphasized the position of the Republican party and pledged it to the support of States rights. The year 1801 brought an overwhelming defeat to the Federalists; Jefferson was inaugurated President and Madison became Secretary of State. He was thoroughly in sympathy with the President's views and shared the popularity of that brilliant administration. The last years of Jefferson's second term were clouded by the insulting actions of England and France with reference to the American navy. The orders of the British and the decrees of Napoleon concerning the seizure of neutral vessels were ruining American commerce. Vessels were seized by the English and by the French, American seamen were impressed, and ports blockaded. Jefferson was opposed to war and in his efforts to coerce France and England by commercial restrictions he induced Congress to lay an embargo on British trade. Instead of injuring England this seriously crippled American commerce and was soon repealed. In this troubled condition of affairs Madison became President in 1809. Like Jefferson he was opposed to war and tried diplomacy. He attempted through Erskine, the British envoy, to have the British orders in Council withdrawn. Erskine agreed, but the British government repudiated the action of its envoy. Negotiations with another British Minister, James Jackson, were also fruitless. Continued insults were heaped upon American ships and men; the country demanded definite action against the aggressors; even the peace-loving President, weary of the offensive attitude of England, at last gave his consent to war. On the 18th of June 1812 war was declared and continued with varying success until the Peace of Ghent in 1814. After nearly three years of fighting, after ruinous loss of money and property, the country was practically just where it stood in 1812, "its boundary unchanged, its international rights still undefined, the people still divided." Madison lacked vigor as a war president, nor had he sufficient determination to secure advantageous terms of peace. He was far greater as a framer of the Constitution than as an executive.

In 1817 Madison retired from office and settled on his estates of Montpelier. He had married in 1796 Mrs. Todd, afterward the celebrated Dolly Madison, and with her he enjoyed 20 peaceful years in his country home. He was interested in farming, he thought and wrote much on all topics of public interest. He discussed social and moral questions, slavery and education. "Education," he maintained, "was the true foundation of civil liberty." The last public appearance of the venerable statesman was in the Virginia Convention of 1829 which met to amend the State constitution. In character Madison was thoughtful, reserved, and cautious; in a time of hard drinkers he was notably abstem-

ious. Moderation characterized all his habits. Dignified and kindly and an excellent conversationalist among those he knew well, he made and retained warm friends. His knowledge was profound and accurate, and he was considered an authority on all constitutional matters. His literary style was labored, but his arguments were keen, comprehensive and convincing.

Consult *Lives of Madison* by J. Q. Adams, Rives (1859-69); Gay (1884); also 'Letters and Writings of Madison' edited by Hunt (1900); Henry Adams, 'History of the United States from 1801 to 1817' (1889-90).

EMILIE McVEA,

Of the University of Tennessee.

Madison, Lucy Foster, American novelist: b. Kirksville, Mo., 8 April 1865. She was educated at the High School in Louisiana, Mo., and was married in 1890 to W. S. Madison. She has published 'A Maid of the First Century' (1899); 'A Maid at King Alfred's Court' (1900); 'A Colonial Maid' (1902).

Madison, Ga., city, county-seat of Morgan County; on the Central of Georgia and the Georgia R.R.'s; about 70 miles east by south of Atlanta. It is situated in an agricultural region largely devoted to the cultivation of cotton. Its manufactures are cottonseed-oil, furniture, chairs, baled cotton, and dairy products. Madison has a large cotton trade. Pop. (1890) 2,131; (1900) 1,992.

Madison, Ind., city, county-seat of Jefferson County; on the Ohio River, and on the Pittsburg, C., C. & St. L. railroad; about 85 miles southeast of Indianapolis. Steamers ply regularly connecting Madison with river ports on the Ohio and Mississippi rivers. The city was incorporated in 1824. Its principal industrial establishments are foundries and machine-shops, lumber yards, cotton and woolen mills, flour and lumber mills, and tanneries. Madison is the trade centre for quite an extent of territory in Ohio. Its educational institutions are public and parish schools and Saint Gabriel's Academy. The government is vested in a mayor, who holds office two years, and a council. The mayor appoints the city treasurer, city clerk, and the marshal. The council elects the other administrative officials. The waterworks plant is owned and operated by the city. Pop. (1890) 8,936; (1900) 7,835.

Madison, N. J., borough, in Morris County; on the Delaware, L. & W. railroad; about 25 miles west of New York. It is a residential borough where a number of New York and Newark business men have their homes. It is one of the oldest places in the State, but was not incorporated until 1889. The principal industry is floriculture, especially the cultivation of roses. Madison is the seat of the Drew Theological Seminary; and Convent Station nearby is the seat of Saint Elizabeth's College. The park is well laid out and kept in good order. The borough is governed by a mayor and council. The term of office of the mayor is two years. The electric-light plant and the waterworks are owned and operated by the borough. Pop. (1890) 2,469; (1900) 3,754.

Madison, S. Dak., city, county-seat of Lake County; on the Chicago, M. & St. P. railroad; about 40 miles northwest of Sioux Falls. The surrounding region has good farm-

ing land, wheat being the principal crop. Considerable attention is given to stock raising. The trade is chiefly in wheat and live-stock. Madison is the seat of a State Normal College which had in attendance in 1903 about 500 students. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1900) 2,550.

Madison, Wis., city, capital of the State, county-seat of Dane County; on the Chicago, M. & St. P., the Illinois C., and the Chicago & N. W. R.R.'s; about 80 miles west of Milwaukee and 120 miles northwest of Chicago. It is between Lakes Monona and Mendota and near two other beautiful lakes, Kegonsa and Waubesa; it is 790 feet above the sea and 210 feet above Lake Michigan. The place was named in honor of James Madison. The first house was erected in 1837; and after Wisconsin, in 1836, had been organized as a Territory, this site was chosen for the capital, and work on the Capitol was begun in 1837. The place was chartered as a city in 1856.

Madison is situated in an agricultural region, and has commercial interests with a number of the larger cities, also with the small towns and villages in Dane and adjoining counties. Its chief manufactures are boots and shoes, agricultural implements and tools, flour, electrical machinery, wagons and carriages, blank books, and law books. It is a famous summer resort because of its climate, lakes, and scenery. The drives are remarkable,—about 30 miles of road in the vicinity are macadamized and kept in repair by popular subscription.

Madison is noted for its educational institutions, chief of which is the University of Wisconsin (q.v.). Opposite the university is the State Historical Society headquarters, the most beautiful building in the city. It is Ionic, of Indiana limestone, and the original cost was \$700,000. It contains a valuable collection of historical mementoes and the famous reference library of the society, about 245,000 volumes. It is considered one of the best historical libraries in the United States. The libraries of the Wisconsin Academy of Sciences, Arts, and Letters and of the State University are also in this building. The city free public library is housed in a building of its own, a gift from Andrew Carnegie. Just outside the city limits is the Academy of the Sacred Heart (R. C.), a boarding schools for girls, a branch of the Battle Creek Sanitarium (q.v.), and the State Hospital for the Insane. The public and parish schools maintain a high standard. The State fish hatchery is near the city. Some of the other prominent buildings are the Capitol, already mentioned, which is surrounded by a beautiful park, the county court-house and jail, a government building, and twenty-two churches. It is a favorite educational convention city. The university summer school, held each year, attracts a number of students. It was for several years the home of the Columbian Catholic Summer School, which had in attendance people from all over the United States and Canada.

The government is vested in a mayor, whose term is two years, and a council. The city owns and operates the waterworks. Pop. (1900) 19,164.

GEORGE RAYMER,

President Democrat Printing Company.

Madison River, a stream in Montana which has its rise in the Rocky Mountains, at an elevation of 8,300 feet. It flows north through Madison County and unites with the Jefferson Fork of the Missouri, at Three Forks. It flows through several picturesque valleys and deep cañons; its whole course is about 230 miles.

Madison Square Garden, a large building in New York city, occupying a block or square between Madison Avenue and 4th Street, and 25th and 26th Streets. It contains an amphitheatre seating 20,000 people, and is popular for horse shows, dog shows, circuses and political and religious meetings. The building also contains a theatre, concert hall, restaurant and roof-garden. It is built of buff brick and terra-cotta and is surmounted by a great tower 300 feet in height, modelled after the Giralda at Seville. It is one of the largest buildings in the city devoted to amusement.

Madisonville, Ky., city, county-seat of Hopkins County; on the Louisville & N. railroad; about 125 miles southwest of Louisville. It is in a rich agricultural region, tobacco being one of the principal productions. Coal and natural gas are in the near vicinity. The chief manufacturing establishments are a tobacco factory, tobacco stemmeries, lumber and planing mills, and flour mills. A coal mine nearby and the natural gas contribute to the prosperity of the city. Pop. (1890) 2,212; (1900) 3,628.

Madness. See INSANITY.

Madoc, mād'ók, Welsh prince, who, in consequence of some domestic dissensions, went to sea with 10 ships, and 300 men, in 1170, and discovered America. He made a second voyage to and from this unknown land, but finally was lost to the knowledge of his countrymen. The story is to be found in Lloyd and Powell's 'Cambria' (1584), and Hakluyt gives an account of the voyages in his collection. In Owen's 'British Remains' the legend, if it is anything more, is referred to. Later travelers have imagined that they had discovered traces of these early immigrants in different parts of the country, and we have had stories of White Indians and Welsh Indians, etc. See Humboldt's 'Personal Narrative,' Book IX., note A. Southey has made Madoc the subject of an epic poem. Stephens, in 'Madoc, an Essay on the Discovery of America in the 12th Century' (1893), proves that the story of Madoc is mere baseless fable.

Madonna, ma-dōn'a (Italian), properly *my lady*; thus Petrarch often calls Laura *madonna*; but in art it is more particularly applied to the Virgin Mary. Many celebrated pictures are known under the name of Madonna, as the famous 'Madonna di Sisto' of Raphael in the gallery of Dresden.

Madouqua, mād'ō-kwa, a diminutive antelope (*Cephalophus abyssinicus*), one of the duiker-boks (q.v.), common in Abyssinia. The fore-parts are rufous, but gray is the prevailing hue. The same name is sometimes applied to other very small north African antelopes, as the Beni Israel.

Madras, ma-drās', British India, a province formerly a presidency, occupying the southern portion of the Indian peninsula. It stretches from the Bay of Bengal to the Arabian Sea, almost enclosing Travancore and Mysore, while a long, narrow portion extends along the west side

MADRAS—MADRE DE DIOS

of the Bay of Bengal till it meets the Bengal province about 70 miles from the mouth of the Mahānadi. It has a total area including native states of 150,798 square miles, the area of the native states being 9,475 square miles. Jaipur and Haidarabad bound it on the northwest, while the west borders for a short distance with Bombay. The chief mountain ranges are the Western Ghāts, the Eastern Ghāts, and the Nilgiri Mountains. The principal rivers are the Godāveri, and Kistna, with their tributaries; and the North Penner, South Penner, Palar, Kaveri, Coleroon, and Vaiga. There are no lakes of any importance, but many salt lagoons or inlets of the sea. Extensive forests yield teak, ebony, and other valuable timber trees. The wild animals are those common to other parts of India, the elephant, tiger, chetah, bear, bison, elk, spotted deer, antelope, jackal, wild hog, jungle sheep etc. The climate generally is reckoned the hottest in India, but differs widely in different localities according to elevation. The soil along the coasts, particularly those of the Carnatic, is for the most part light and sandy; inland it consists of a decomposed syenite, impregnated with salt, which in dry weather covers the ground with a saline efflorescence. The district of Tanjore on the banks of the Coleroon is esteemed the granary of southern India. The principal vegetable productions are rice, wheat, barley, maize, and all the other grains common in India; sugarcane, areca, yam, plantain, tamarind, jack-fruit, mango, melons, coconuts, and a variety of other fruits; ginger, turmeric, pepper, tobacco, hemp, and cotton, for the growth of which it seems to be particularly well adapted. Tea is grown to some extent. Cotton cloth, muslins, carpets, and silks continue to be manufactured to a limited extent. The government of the presidency is vested in a governor subordinate to the Governor-general of India. The finances are in a healthy condition, the revenue usually exceeding the expenditure. At the head of the educational institutions is the Madras University, an examining body, granting degrees in arts, law, medicine, and engineering. There are various schools and colleges affiliated to the university.

The province is divided into 22 districts with a population (1891) 35,630,440; (1901) 38,208,609. The native feudatory states, Travancore, Cochin, Pudukota, Karnul, and Bellary, had a total population (1891) 3,700,622; (1901) 4,190,322. The languages are Tamil, Telugu (which are spoken by the great majority of the inhabitants), Canarese, and Malayalam, with some lesser dialects spoken by the more barbaric tribes on the mountains; Mahrathi and Gujarathi prevail in the northern and north-western parts of the presidency; Uriya in the northeast; while Hindustani is the language spoken everywhere by the Mohammedans. Capital Madras (q.v.). See also INDIA.

Madras, British India, the capital of the province of Madras, on the Coromandel coast, lies on an open, sandy shore, exposed to the swell of the Bay of Bengal, which breaks upon the beach with great violence. A modern harbor formed by two piers obviates the former dangerous passage through the surf. The city is built on level ground and with its nine suburbs occupies 27 square miles. The chief commercial portion is Black Town, about a mile

square, closely and irregularly built, containing the native and East Indian (or mixed) population, with a few European merchants and their families. On the south is the ancient Portuguese settlement Saint Thomé, with a Roman Catholic cathedral. One of the chief objects of interest is Fort St. George, which commands the Black Town and the roads, and may be considered the nucleus of the city. It was built in 1639, and is admirably situated for the defense of the town and shipping. It contains a church, the barracks, and an arsenal. The government-house, the Cathedral of St. George, and some of the other churches and public buildings, are handsome structures. Besides the University, the Presidential College, and a medical college, supported by government, there are large missionary institutions. The public park, containing a small zoological collection, is the chief recreation ground of the city. From the meridian of the observatory connected with the university all India takes its time. Madras is the chief seat of the provincial government offices, of the supreme court, a board of revenue, marine board, etc. Notwithstanding the disadvantages of its position it is a place of great trade, and a new harbor has greatly tended to increase traffic. The landing and shipping of goods is effected partly by lighters to the pier-head inside the harbor, and partly by the old *massula* or surf-boats, which land their cargoes on the beach. The imports are chiefly manufactured goods from the United Kingdom, especially cottons, wines, spirits, metals, stationery, etc. Among the principal exports are cotton, grain, indigo, coffee, tea, hides, oil-seeds, dye-stuffs, pepper, etc. The chief industries are connected with the preparation of goods for export, such as coffee pressing and cotton cleaning. Cotton-spinning factories have been established at Madras. The country at a short distance round the city, presents a remarkable contrast to its barren sandy shore, having the appearance of a fine park. The city has railway communication with all the principal places of India.

Madras was founded in 1639 by the English, who obtained the grant of a piece of ground for the erection of a town and fort from the Rajah of Chandgherry. It soon became a flourishing city and the chief station of the English on the Coromandel coast. In 1746 it was taken by the French, who kept it until 1749, when peace was made and the place was restored to the English. In 1758 it was again besieged by the French under the celebrated Lally, who was obliged to retreat after a siege of two months. Pop. (1901) 509,397.

Madrazo, mā-drā'thō, **Raimundo de**, Spanish painter: b. Rome, Italy, 24 July 1841; d. Madrid, Spain, 11 June 1894. He studied art under his father, Federico de Madrazo, and Léon Cogniet in Paris. He was very successful in portrait and genre and numbered many prominent Americans among his sitters. He was equally happy in pastel and oils, and his 'Fête during the Carnival' in Mrs. W. K. Vanderbilt's collection is as brilliant in conception as in technique.

Madre de Dios, mā-drē dē dé'oos, or **Amaru-Mayu**, Bolivia, a river, the chief affluent of the Beni, rising in the Carabaya Mountains, Peru, about 50 miles east of Cuzco, and

MADREPORE — MADRID

after an easterly course, south by north, of 900 miles, chiefly through the Bolivian department of La Paz, uniting with the Beni at Rivera Alta, where it is 1,500 yards wide. It was explored in 1865 under the auspices of the London Geographical Society, and since 1881 has been the highway for the exploitation of the rubber forests along its course.

Mad'repore, a genus of coral-forming polyps (see CORAL) containing numerous species from the warmer and tropical seas of all parts of the earth. The true Madreporæ increase by budding, the result being usually large branching colonies in which the coral between the cups containing the polyps is perforate and spiny. The different species frequently attain large dimensions and constitute one of the most important elements in the formation of coral reefs. The polyps have 12 septa and 12 tentacles, 6 being large, the other 6 smaller, while a peculiar feature is the presence of 6 U-shaped tubes connected with the oesophagus at either end. The term *Madreporaria* is sometimes used to include all polyps in which the parts are arranged in multiples of six, and which secrete coral on the external surface of the body.

J. S. KINGSLEY,
Tufts College.

Madrid, mā-drīd' (Sp. mā-drēd'), Spain, the capital of the kingdom and of the province of Madrid, a part of New Castile, situated near the centre of the country, on the left bank of the Manzanares, a sub-affluent of the Tagus. It is built on several low and irregular sand-hills on a plateau 2,450 feet above sea-level, and is surrounded by a barren and extensive plain, treeless save in the vicinity of the city, and stretching northward to the snow-capped Sierra de Guadarrama. In winter the climate is exceedingly severe, and even in summer, when the heat is excessive, piercingly cold blasts descend from the mountains. The prevailing winds are the parching southeast *Solano*, and the icy north wind from the Guadarrama. The climate is described in a Spanish proverb as "three months of winter and nine months of hell." The temperature ranges from 18° to 105° F.; is subject to frequent and sudden changes; and between the sunny and shady sides of a street the difference of temperature is sometimes as great as 20°. Madrid was until recently surrounded by a wall 20 feet high, pierced by 5 large and 11 small gates; of these gates 3 remain: the Puerta de Alcalá on the east, the Puerta de Toledo on the south, and the Portillo de San Vicente on the west. The streets are distributed somewhat irregularly around the Puerta del Sol, which is in the centre of the capital. The principal streets are broad, long, and airy; and the houses are in general well constructed, substantial, and of good appearance.

In common with most European capitals, Madrid has undergone much modern improvement; the streets are traversed by electric and horse car lines; are lighted by gas and electricity; the telephone system is efficient; and sanitation has been much improved. The former abundant and pure water supply, is, however, inadequate to the demands of the growing population. Madrid has no edifices of great antiquity. The royal palace, situated at the western extremity of Madrid, is one of the most mag-

nificent in the world. It occupies the site of the original Alcazar (castle) of the Moors, and is of enormous extent, being 470 feet each way, and 100 feet high. The architecture is a combination of Ionic and Doric. It contains a small but splendid Corinthian chapel, and a library of nearly 100,000 volumes, and the armory is one of the finest in the world. The chamber of deputies, which occupies an area of 42,700 square feet, has a hexastyle Corinthian portico on the grand façade, destined for the entrance of royalty on state occasions. On the two lateral façades are the entrances for the members. The Royal Exchange and the Bank of Spain are two modern imposing buildings. Madrid stands far behind many provincial towns as regards its churches, which are, with exception of a few attached to conventual establishments, poor, and of indifferent artistic merit. The church of the Almudena founded by King Alphonso XII. is in course of erection. The most important of the charitable institutions are the military hospital, an extensive building in the northwestern corner of the city; and the Hospicio of San Fernando, with schools for both sexes, the pupils being taught various handicrafts. At the southeastern corner of the city stands the general hospital, containing 1,200 beds. There are three foundling hospitals and six for orphans.

Madrid has 72 public squares, which are generally irregular both as regards their form and their edifices, as well as deficient in decorative monuments. Of these the Plaza Mayor is one of the largest and most regular. The Plaza de Oriente is adorned with 40 statues of Gothic kings, as well as those of the Asturias, Leon, Castile, and Aragon. In the centre is a fine equestrian statue of Philip IV. Among places of amusement the most popular is the Plaza de Toros (bull-ring), a building which is about 1,100 feet in circumference, and capable of containing 12,000 spectators. The Prado, a sort of wide boulevard, about 2 miles long, running north and south on the east of the city, is the chief promenade, and beyond it is the chief public park, including the Buen Retiro gardens, near which are the new handsome building for various ministerial departments, and the new station of the Southern Railway Company. The Royal Picture Gallery which stands in the Prado, contains more than 2,000 pictures, including a great many by all the best masters, especially those of Spain. There are also good pictures in the Academy of Fine Arts. The National Library, founded by Philip V., contains 500,000 volumes, is well managed, and is open to the public daily from 10 to 3. The Library of San Isidoro consists of 66,000 volumes. The University of Madrid, which arose out of that of Alcalá de Henares, founded in the 15th century, has an average attendance of 5,000 students. There are besides numerous other schools, academies, and colleges, public and private, including a normal school, a deaf and dumb institution, a normal school for the blind, a commercial school, schools for engineers, a conservatory of music, an academy for the fine arts with a gallery of 300 pictures, a veterinary college, an academy of medicine and surgery, etc. The famous monastical and palatial Escorial (q.v.) is 27 miles northwest of the city.

The industries have shown a remarkable de-

velopment during the last decade, the chief manufactures being tobacco, leather goods, chocolate, beer, shoes, boots, plated ware, coaches, gloves, and fans. There is a royal carpet and tapestry factory in the Pacifico suburb. The commerce is important, as Madrid is the entrepôt for all the interior provinces. Retail business is mainly in the hands of foreigners, mostly French, but most of the wholesale trade is carried on by native houses. Madrid has railway communication with Paris and Lisbon, and the chief cities of the Peninsula.

Madrid in the Roman period probably was the insignificant hamlet Majoritum. Under the name Majorit it appears as a Moorish outpost of Toledo when captured in 932 by Ramiro II. of Leon. Henry IV. about 1461 made some additions to the older town, which was placed on the western eminence over the river. Madrid only began to be a place of importance under Charles V. Declared the seat of the court by Philip II. in 1560 the city rapidly grew up at the expense of the older and better situated capitals. It was the creation of a century, and its increase was very slow after the age of Philip IV. The gross mistake of a position which has no single advantage except the fancied geographical merit of being in the centre of Spain was soon felt, and on Philip II.'s death his son, in 1601, endeavored to move the court again to Valladolid, which, however, was found to be impracticable, such had been the creation of new interests during the outlay in the preceding reign. Madrid was entered by the French under Murat, 23 March 1808, but they were soon obliged to evacuate it. It was again held by the French from 1809 to 1812, when the Duke of Wellington entered it, and restored it to the Spaniards. After the deposition of the crown by King Amadeus in 1873, Madrid, along with the rest of Spain, suffered greatly from the anarchy caused by the struggles between the Republicans, Carlists, and Socialists. Pop. (1887) 472,228; (1900) 540,109.

Mad'rigal, a short lyric poem generally on amatory subjects. Those of Tasso represent the finest specimens of Italian poetry.

Madro'na, a large and ornamental tree of California (*Arbutus menziesii*), of the heath family, which often grows nearly 100 feet in height. It has a wide-spreading head, small evergreen leaves and the limbs and large parts of the trunk, where the thin outer bark easily peels off, are bright red. It grows in the foot hills, and up to a moderate elevation, but not naturally in the valleys. It is a near relative of the strawberry tree of Europe.

Mad'stone, a vegetable substance or stone which when applied to a wound caused by the bite of a mad dog is said to prevent hydrophobia. The most famous one in the United States is owned by the descendants of a family named Fred, in Virginia. This stone was brought over from Scotland in 1776. It is said to be the one spoken of by Sir Walter Scott in 'The Talisman' and has been religiously preserved as one of the most valuable relics of the age. It is about two inches long by one inch broad, and about half an inch thick, and is of a chocolate color. When applied to the wound it adheres till all the poison is absorbed, when it drops off. It is then soaked in warm milk or water for a time, and when removed the liquid,

is found to be full of a greenish-yellow scum. It is said that of the 130 cases in which it has been applied for the bite of a mad dog, none ever suffered from hydrophobia. There are said to be three authenticated madstones in the United States.

The belief in a madstone was common hundreds of years ago in the East, and travelers in India in 1677 and 1685 make mention of it. Tradition said it grew on the head of certain snakes. George T. Kunz, a New York expert in gems, identifies the madstone, or snakestone, of the East, with the stone known as tabersheer, which is a variety of opal found in the joints of the bamboo in Hindustan and Burma. This stone is formed of juice which by evaporation becomes mucilaginous, then a solid substance, and when placed in the mouth will adhere to the palate or cause water to boil. Sir David Brewster says it is found in the joints of diseased corn-stalks and is formed by sap depositing silica.

Madura, mā-doo'rā, southeastern Asia, an island of the Malay Archipelago, off the east end of Java, from which it is separated by the Strait of Madura. The island is about 105 miles long east to west, and 30 miles broad, with an area of 1,770 square miles. Madura forms one of the 17 Dutch residencies or provinces into which Java and Madura are divided, and is administered by a governor or resident. The Dutch first landed in Madura in 1747. It is undulating, but not mountainous, and though in general well watered, in some places, especially on the coast, there is a want of water, and the soil is unfertile. The interior, however, is fertile, though not so productive as Java. Maize, coconuts, tobacco, Jamaica pepper, tamarinds, and salt are the chief products; stock-raising is an important industry; and the exports include also birds'-nests, country cloths, white and striped, poppy-oil, rattan-mats, and baskets, etc. The chief towns are Bangkalang, Pamekasan (the capital), and Sumanap. Pop. (1897) 1,652,580, of whom 4,252 were Chinese, 558 Europeans and the rest natives.

Madura, southern India, the capital of a district of Madras, 344 miles by rail southwest of Madras. It was the capital of the ancient Pandhyan kingdom, for over 2,000 years was the political and religious capital of southern India, and is noted for its interesting architectural monuments, chief of which is the Temple of Minarchi, dating from almost prehistoric times, restored and added to by Tirumulla Nayak (1622-62). It ranks fourth among the seven strongholds of Hinduism, and occupies a parallelogram of 56,000 square feet containing 50 buildings. Madura is the seat of Catholic and American Protestant and other missions, and has several high-grade educational institutions. Pop. (1901) 105,501.

Madvig, mād'vīg, Johan Nikolai, Danish scholar; b. Svanike, island of Bornholm, 7 Aug. 1804; d. Copenhagen 13 Dec. 1886. Educated at Frederiksborg and Copenhagen, he was from 1829 till 1879 professor of Latin in the University of Copenhagen. He took a profound interest in the politics of his country, and from 1848 till 1851 was minister of education and religion. He is best known by critical editions of Latin classics and by his Latin grammar translated into English and most European

MÆANDER — MAETERLINCK

tongues. His chief works are: 'Emendationes in Ciceronis Libros Philosophicos' (1828); 'Cicero's De Finibus Bonorum et Malorum' (1839, amended 1876); 'Ciceronis Orationes Selectæ Duodecim' (1830); 'Cicero's Oato Major and Lælius' (1835); 'Opuscula Academica' (1834-42; new edition 1887); 'Emendationes Livianæ' (1860); 'Livii Opera' (with Ussing, 1861-6); 'Adversaria Critica' (1871-84); 'Latin Grammar' (1841); 'Greek Syntax' (1846); 'Constitution and Administration of the Roman State' (1881-2); 'Autobiography' (1887).

Mæander, mē-än'dér, now **Mendere**, Asiatic Turkey, a river which rises in Phrygia not far from Celænæ. It forms the boundary between Caria and Lydia, and flows into the Icarian Sea between Priene and Myus, opposite Miletus. It was celebrated among the ancients for its winding course, and gave its name to the intertwined purple borders on mantles and other dresses, as well as upon urns and vases.

Mæandrina, mē-än-drī'na, one of several genera of brain corals, so called from the elongate and meandering cups containing the polyps, which give a spherical mass of these corals an appearance strikingly like the human brain with its convolutions. This appearance is due to the fact that the polyps in their growth do not completely divide, but stretch out into long bands, frequently branching, with many mouths and tentacles, and a common body and digestive cavity. Brain corals occur in all tropical seas, several species being found in Florida and the West Indies. Their solid masses make them important factors in the formation of coral reefs.

J. S. KINGSLEY,
Tufts College.

Mæcenās, mē-sē'nās, **Gaius Cilnius**, Roman nobleman: b. between 73 and 63 B.C.; d. 8 B.C. He was the friend of Augustus, and patron of Virgil and Horace. Though it is unknown where he received his education, it must have been a good one, for he was intimate with the literatures both of Greece and Rome, and was himself an occasional writer in prose and verse. We first hear of him authentically (40 B.C.) as negotiating a marriage between Octavianus and Scribonia; and in the same year he contributed materially to bring about the Peace of Brundisium, by which Cæsar and Antony were reconciled. Two years later he was again employed in reconciling these self-willed potentates; and 36 B.C. he was twice despatched by Octavianus from Sicily to Rome to quell disturbances which had broken out there. He was for these services entrusted with the administration not only of Rome, but of all Italy. His palatial residence and gardens on the Esquiline were the rendezvous of all the *literati* of Rome, and of numerous parasites. But those admitted to his intimacy were the greatest geniuses and scholars of Rome, among them being Virgil and Horace. To the intercession of Mæcenās, Virgil was indebted for the recovery of his farm, and Horace also owed to him many favors.

Mælar, Lake of. See **MÄLAR**.

Maelstrom, mäl'ström, or **Moskoe-strom**, Norway, a rapid current or tidal whirlpool off the northwest coast immediately southwest of Moskenesoe, the southernmost of the Lofoten Isles. The current runs with the tides alternately,

six hours from north to south and six hours from south to north, producing immense whirls. The depth of the water around, supposed at one time to be too great to admit of soundings, has been ascertained not to exceed 20 fathoms, with a bottom of rocks and white sand. Immediately to the west the soundings are from 100 to 200 fathoms. The whirlpool, idealized by mediæval and later writers including Edgar Allan Poe, is greatest at high or low water. When the wind is northwest and opposed to the reflux of the waves it attains its greatest fury, and becomes extremely dangerous, but in ordinary circumstances it may be traversed without difficulty.

Maestricht, mäs'trīnt, Netherlands, the capital of the province of Limburg, on the left bank of the Maas, at the confluence of the Geer, lies on the Belgian frontier, 55 miles east of Brussels, and 52 miles west by south of Cologne. Among the chief buildings are the church of St. Servais, partly Romanesque and partly Gothic, dating from the 10th century; the town-hall; the courts and general prison, and the arsenal. The fortifications were dismantled between 1871 and 1878; it is, however, still a considerable garrison town. Maestricht carries on an active transit trade with Belgium, and has manufactures of glass and earthenware, firearms, shot, cloth, and paper-hangings; also iron-foundries, beet-root sugar refineries, tobacco and cigar factories, tan-pits, distilleries, and breweries, the latter producing very noted beer. About three miles from the town is the Pietersberg (Peter's Hill), on which stands the fort of St. Pierre, and under which are extensive subterranean quarries, supposed to have been excavated by the Romans. Maestricht was besieged and taken, and 8,000 of its inhabitants were massacred in 1579, by the Spaniards, under the Duke of Parma; in 1673 it was taken by Louis XIV., and again by the French in 1748 and 1794. William III. of England failed to take it; and in 1830 its garrison resisted successfully the attacks of insurgent Belgians. Pop. (1901) 34,182.

Maestricht Beds, in geology, a series of calcareous beds 100 feet thick, on the banks of the Meuse, near the Dutch city of Maestricht. The Maestricht calcareous rock contains *Belemnitella*, *mucronata*, *Pecten quadricostatus*, etc., also the genera *Braculites*, *Hamites*, etc., which are only Mesozoic. It is a connecting link between the Secondary and the Tertiary rocks, but in all essential respects belongs to the former.

Maeterlinck, mêt'ér-līnk, **Maurice** (Gallitized from the original **MOORIS MÄTERLINCK**), Belgian author: b. Ghent 29 Aug. 1862. He was educated in a Jesuit school in Belgium, then studied law, was admitted to the bar in 1887, but was from the first more interested in letters, and in 1896 settled in Paris as an author. His work may be divided into three parts,—his lyric verse, his dramas, and his philosophical essays. Of the first the two volumes 'Serres Chaudes' (1889), and 'Douze Chansons' (1896) are representative. Maeterlinck's verse is imaginative, but lacks in any strong degree the melodic quality. His dramas are: 'La Princesse Maléine' (1889); 'Les Aveugles' (1890); 'L'Intruse' (1890); 'Les Sept Princesses' (1891); 'Pélieas et Mélisande' (1892); 'Alladine et Palamides' (1894); 'La

Mort de Tintagiles' (1894); 'Aglavaine et Sélysette' (1896); and 'Monna Vanna' (1902). Several of these were translated into English by Richard Hovey (q.v.), and 'Monna Vanna' was rendered by Alexis I. du P. Coleman. The dramas are Maeterlinck's most striking work. Their eery symbolism can hardly be explained, but must be appreciated at first hand. Though they inaugurated a new theatric school—the 'Drame Intime'—they are properly reading plays, and lose their mystery and impressiveness in presentation. 'Pélleas et Mélisande' was given in the United States by Mrs. Patrick Campbell. To many the essays are the most interesting things that Maeterlinck has done. The volumes are 'Le Trésor des Humbles' (1896); 'La Lagesse et la Destinée' (1898), and 'La Vie des Abeilles' (1902). The first is somewhat mystical, all are somewhat diffuse; but he has been called by virtue of them a true successor of Swedenborg and Böhme.

Mæviad and Baviad. See BAVIAD.

Mafeking, mā-fā-kīng' or mǎf'ē-king, Cape Colony, a former Bechuana settlement, now a town, the administrative seat of the Bechuana-land protectorate, close to the borders of the Transvaal, 870 miles by rail northeast of Cape Town and about 200 miles west-southwest of Pretoria. The town stands near the upper Malopo River, and contains several substantial buildings, including a Masonic temple, a town-hall and a hospital, and there is a good water-supply, a swimming-bath, and a race-course. Mafeking sustained a protracted siege during the South African War of 1899-1901. It was isolated in October of the former year, and was brilliantly defended by a small force under Colonel (now General) Baden-Powell, until relieved by Colonel Mahon in May 1901.

Maffitt, John Newland, American clergyman: b. Dublin, Ireland, 28 Dec. 1794; d. Mobile, Ala., 28 May 1850. He was a Wesleyan preacher in Ireland and in 1819 emigrated to the United States, where he became a member of the New England Methodist Episcopal conference. He founded the 'Western Methodist' in Nashville in 1833 and conducted revivalist meetings throughout the South and West. In 1837 he became professor of elocution and belles-lettres at La Grange College, Louisiana, and in 1841 he was elected chaplain to Congress. He published several religious works, also an autobiography.

Maffitt, John Newland, American naval officer: b. at sea 1819; d. 1886. He enlisted in the United States navy in 1832 and in 1861 entered the service of the Confederacy where he took rank as commodore. In command of the Florida he rendered himself valuable to the Confederate cause, taking many prizes and damaging seriously United States commerce. Owing to ill-health he resigned before the end of the War.

Mafia, mā-fē'ā, a Sicilian secret society similar to the Camorra, which has long existed in Naples, but much more powerful. The Mafia is essentially a form of organized lawlessness, but its organization is sufficiently elastic to baffle all the attempts of the government to suppress it. It is generally said to have had its origin in the *compagni d'armi*, a kind of police organized in Sicily early in the 19th century and dissolved by Garibaldi in 1860. Its mem-

bers, who are required to prove their daring in a knife duel, are bound never to carry their suits to the regular courts or to give evidence before them. Murder and robbery are discounted under ordinary circumstances, but they are resorted to without hesitation in the case of informers or specially obnoxious persons. Blackmail is levied from land-owners, who are required to employ only *mafiosi* in certain occupations. Criminals are protected and elections controlled by this infamous society, whose authority is greater than that of the law among the lower classes in Sicily. The Chinese high-binder societies are similar to the Mafia. Within recent years these murderous organizations have secured a footing in the United States, and murders directly chargeable to the Mafia have been committed in New York, New Orleans, Chicago, and other large cities.

Magalhães, Domingos José Gonçalves de, dō-mēng'gō hō-sǎ' gōn-sǎl'vēs dā mā-gāl-yā'ēns, VISCOUNT D'ARAGUAYA, Brazilian poet and diplomat: b. Rio de Janeiro 13 Aug. 1811; d. Rome, Italy, 10 July 1882. He was admitted to the bar, but entered the Brazilian diplomatic service in 1836, and was minister at Vienna, at Washington (1868-72), and at Rome. He is rated among the foremost of Brazilian poets. His best-known work is the 'Confederação dos Tamoyos' (1857), based on historical events in early Brazil. Among his other volumes are 'Mysterios' (1858) and 'Urania' (1862); and he wrote also philosophical treatises and successful tragedies. A collected edition of his works was published in 1876.

Magalhães, Fernão de. See MAGELLAN, FERDINAND.

Magallanes, mā-gāl-yā'nes, Chile, a territory lying south of the Department of Chiloe, and includes the many islands, large and small, along the western and southern coasts of Chile. Its entire area is over 80,000 square miles. Among the more prominent islands in the territory are the Wellington group, Hanover group, Queen Adelaide Archipelago, Madre de Dios and a part of Tierra del Fuego. The mainland is a narrow strip of mountainous sea-coast. Pop. about 6,000.

Mag'dala, Abyssinia, a town and fortress on a plateau nearly 9,000 feet above the level of the sea, about 120 miles southeast of Gondar, on the left bank of the Bashilo, an affluent of the Blue Nile. A wall of columnar basalt, varying from 30 to 700 feet high, surrounds it on every side. Magdala acquired notoriety from its having been stormed in 1868, by the British troops under Sir Robert Napier, afterward Lord Napier of Magdala. (See ABYSSINIA.) The Abyssinians had deemed their fortress impregnable.

Magdalen, mǎg'da-lēn, a name applied to one of the Marys in the Gospels, derived from her place of birth, or former residence, in order to distinguish her from other women of that name (Matt. xxvii. 56, 61; Mark xv. 40, 47; Luke vi. 2; John xix. 25).

Magdalen (mǎg'da-lēn or mōd'lin) **College**, Oxford, England, originated in Magdalen Hall, founded in 1448 by William Patten, commonly called William of Waynflete, from the place of his birth, Bishop of Winchester and Lord High-chancellor of England, who 10 years later added

MAGDALEN ISLANDS — MAGELLAN

the College of Saint Mary Magdalen. In some respects Magdalen is the most noteworthy college of the university. Five of the fellowships are attached to five Waynflete professorships, of moral philosophy, chemistry, mineralogy, physiology, and pure mathematics, established in lieu of the three former lectureships of divinity, moral philosophy, and natural philosophy. There is also a professorship of botany. The buildings are noted for their beauty and occupy extensive grounds. Among Magdalen's celebrated alumni are Addison, Foxe, Gibbon, Hampden, Lily, Lyly, Philpotts, Selborne, Tyndale, and Wolsey.

Magdalen (măg'də-lén) **Islands**, Québec, Canada, near the centre of the Gulf of St. Lawrence, 54 miles northwest of Cape Breton, Nova Scotia, and 100 miles southwest of Newfoundland. Amherst, Alright, Coffin, Wolf, Grindstone, Deadman, Entry, and Byron islands compose the group which are politically attached to the district of Gaspé, Québec. The inhabitants exist chiefly by the fisheries of the adjacent waters; gypsum which is found in veins and hollows, and grindstones from Grindstone island, are exported. House Harbor on Alright Island, and Amherst where there is a custom-house, are the chief settlements. Pop. 3,200.

Magdalena, măg-dă-lă'nă, a river of Colombia, South America, which has its rise in the Andes Mountains in the southwestern part of Colombia, and flows north to the Caribbean Sea. A short distance from the sea, at the city of Barranquilla, the river divides and discharges its waters through two channels. It is about 1,000 miles in length. It is navigable for ocean steamers to Barranquilla, and for small steamers to Honda, about 600 miles from its mouth. Navigation is obstructed at Honda by a series of falls and rapids; and a railroad, about 22 miles long has been built along the river to a point above the rapids, from which the river is navigable up the stream for about 200 miles to Neiva. Magdalena River is the principal route from the sea to the interior of the country. Bogota (q.v.), the capital, is at present (1903) largely dependent upon this river for means of communication with places on the coast. The largest tributary is Cauca, whose source is near that of the Magdalena, and part of its course is almost parallel with the main river. Short railroads connect some of the interior towns with the river and its tributaries.

Magdalena (măg-də-lě'na) **Bay**, an inlet on the west coast of Lower California, in Mexico, one of the best harbors on the Pacific coast. The inlet or arm of the sea is about 40 miles long and is protected by a long low sand-bar. A town of the same name is situated on the harbor.

Magdalene (măg'də-lén) **College**, Cambridge, England, was founded in 1519 by Thomas, Baron Audley of Walden. There are seven open fellowships on the foundation, and 12 open scholarships. There are also several exhibitions. The annual Pepsian benefaction, value £50, is in the master's gift, and is usually bestowed upon poor and deserving students. The buildings consist of two courts, restored and altered in 1880, a chapel and hall dating from the 15th century, and the Pepsian Library, built in 1688.

Magdeburg, măg'dě-boorg, Germany, city, capital of the Prussian province of Saxony; on the Elbe, about 80 miles southwest of Berlin. The manufacturing and trade of Magdeburg are extensive, and its facilities for transportation by water and railroad are excellent. Among its industrial establishments are the Gruson Works, noted for their connection with the Krupp Works, the beet-sugar factories, and a number of other establishments. It has a large number of excellent schools, gymnasias, a pedagogical seminary, art schools, industrial schools, etc. Magdeburg is a place of great antiquity, being a trading centre in the 9th century. It early distinguished itself in the Reformation. During the Thirty Years' war the town was besieged, stormed, and sacked by Tilly, when 20,000 persons are said to have been murdered. Pop. (1902) 230,491.

Consult: Wolter, 'Geschichte der Stadt Magdeburg'; Dodge, 'Gustavus Adolphus.'

Magdeburg Hemispheres, a celebrated invention of two hollow hemispheres, made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stopcock. When the edges are rubbed over with grease, pressed tightly together, and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force. If they are one foot in diameter, they will, after exhaustion, be pressed together with a force of nearly a ton. This experiment was first performed by Otto von Guericke of Magdeburg, in 1650, at the imperial diet at Ratisbon, to the astonishment of the Emperor Ferdinand III. and the royal family.

Magellan, ma-jel'an, **Ferdinand** (in Portuguese FERNÃO DE MAGALHÃES or MAGALHAENS), Portuguese navigator: b. probably at Villa de Sabroza, Trazos-Montes, about 1470; d. Philippine Islands 27 April 1521. He served in the Indies with distinction, especially at Malacca, and in 1514 saw service in Morocco. In resentment at his treatment by the king, who had not, he thought, duly rewarded his services, he, with Ruy Falero, a geographer and astronomer, renounced his nationality and offered his services to Spain. Magellan's proposal to seek a western route to the Moluccas was accepted by Charles V., and on 20 Sept. 1519, he set sail from San Lucar de Barrameda in command of five vessels. He passed through the strait which bears his name (see MAGELLAN, STRAIT OF), and on 28 Nov. 1520, reached the great ocean which he called the Pacific from its calmness. With his three remaining vessels he sailed by way of the Ladrone Islands to the Philippines, discovering Samar on 16 March 1521. He caused the king of Zebu to swear allegiance to Spain, but was killed in a fight with the natives of Matan. His vessel, the Victoria, under Sebastian del Cano, completed this, the first circumnavigation of the globe. The chief authority for the voyage is a work by Pigafetta, an Italian who accompanied Magellan.

Consult: Lord Stanley, 'The First Voyage Round the World' (1875); and Guillemaud, 'Ferdinand Magellan' (1891).

Magellan, Strait of, the channel which separates the continent of South America from Tierra del Fuego and thus forms a communication between the South Atlantic and the South

Pacific Oceans. It is upward of 360 miles long, and is of difficult navigation. Its breadth varies exceedingly, the maximum being somewhat over 70 miles. There are a number of bays along the shore and at the southwestern end, a group of several small islands. Punta Arenas is the best harbor. The strait was discovered in 1520 by Fernando Magalhães or Magellan.

Magellan'ic Clouds, in astronomy, called the Nebulæ, Major and Minor, from their cloud-like appearance, two oval masses of light in the southern hemisphere near the pole; often both visible to the naked eye. Sir J. Herschel describes them as consisting of swarms of stars, clusters, and nebulae of every description.

Magendie, François, frān-swā mā-zhōn-dē, French physician and physiologist: b. Bordeaux 15 Oct. 1783; d. Paris 8 Oct. 1855. He was the pupil of the celebrated surgeon Boyer, and at 20 was appointed successively *aide d'anatomie* in the faculty of medicine, and demonstrator. He, however, subsequently devoted himself principally to the practice of medicine, was in 1819 elected a member of the Academy of Sciences, and in 1831 succeeded Récamier in the chair of anatomy in the College of France, which he retained until his death. As an experimenter in physiology he occupied a high position, and his experiments on living animals were at one time so numerous and involved so much suffering to the animals, that the French government deemed it necessary to interfere. The results obtained, however, were of great importance, if they do not absolve him from the charge of cruelty. Among them may be named an original demonstration that the two roots of the spinal nerves are devoted to two separate functions; that the veins are organs of absorption; that strychnine acts upon the spinal cord and contracts by tetanic spasm the nerves of respiration, thus inducing asphyxia; that food destitute of nitrogen is not nutritious; and that prussic acid is a valuable remedy in certain forms of cough arising from irritation in the lungs. He was a prolific author of medical works, the most important of which are: 'Formulaire pour la Préparation et Emploi de plusieurs nouveaux Médicaments' (1821), containing an account of the effects of certain plants then recently introduced into the materia medica, and which has been translated into all the languages of Europe; 'Précis élémentaire de Physiologie' (1816-17), for many years an important manual for students; 'Leçons sur les Phénomènes physiques de la Vie' (1836-42); 'Leçons sur les Fonctions et les Maladies du Système nerveux' (1839); 'Leçons sur le Sang' (1839).

Magenta, mā-jěn'tā, Italy, town in the province of Milan, 14 miles east of Milan, is situated in a grape region, in which the cultivation of grapes and mulberries and the manufacture of wine are the principal industries. Considerable raw silk is exported. It was the scene of a famous engagement 4 June 1859 between the French and Sardinian forces, and the Austrians. The Austrians were defeated, largely through the superior tactics of General MacMahon (q.v.) of the French army. Pop. (1901) 7,974.

Magenta, or **Aniline Red**, a coal-tar dye, which consists of a mixture of the hydrochlorides of rosaniline and para-rosaniline. (See ROSANILINE.) It may be prepared from aniline

oil by digesting the aniline with arsenic acid, or with nitrobenzene and ferrous chloride. When the oxidation is complete, the rosaniline hydrochloride is precipitated by the addition of common salt in large excess, the hydrochloride being formed by double decomposition, and thrown down because it is but sparingly soluble in salt solutions. Consult Benedikt, 'Chemistry of the Coal-Tar Colors.')

Maggiore, mād'jō'rē, **Lake**, one of the largest lakes in Italy, the *Lacus Verbanus* of the Romans, is situated for the most part in Italy, but also partly in the Swiss canton of Ticino. It is 39 miles in length, and varies in breadth from one half mile to five and one half miles. It is 646 feet above the level of the sea and has a maximum depth of 1,158 feet. The river Ticino flows through it. In a southwestern expansion of the lake are the Borromean Isles (q.v.). On the north and west it is surrounded by granitic mountains, 7,000 feet high, on the south and east by vineyard-covered hills. On its shore are a large number of villages and cities noted for beautiful scenery and historic connections.

Maggot, the larva of a fly. (See FLIES).

Magi, mā'ji, an Accadian term recently brought to light by Assyrian scholars; Accadian being the language of the people of Babylon and Media. The word signifies "august," "reverend," and was the title of their learned and priestly caste. The Semitic nations afterward dominant in Babylonia and Assyria adopted the learning and many of the religious observances of the early inhabitants, as also the name for the learned caste; and out of the Semitic form the Greeks made *magos*. Under the Persian empire the magi were not only the "keepers of the sacred things, the learned of the people, the philosophers and servants of God," but also diviners and mantics, augurs and astrologers. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in both private and public life. Apart from the education of the young princes being in their hands, they were the constant companions of the ruling monarch. Zoroaster, in the course of his great religious reform, reorganized the body of the magi, chiefly by reinforcing the ancient laws as to their manner and mode of life, which was to be one of the simplest and severest, befitting their sacred station, but which had become one of luxury and indolence, and by re-instituting the original distinction of the three classes of *herbeds* ("disciples"), *mobeds* ("masters"), and *destur mobeds* ("complete masters"). The food, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground, and were altogether subjected to the most rigorous discipline. The initiation consisted of the most awful and mysterious ceremonies, and was preceded by purifications of several months' duration. Gradually, however, their influence, which was all-powerful during the epoch of the Sassanian kings of Persia, began to wane, and, from being the highest caste, they fell to the rank of wandering jugglers, fortune-tellers, and quacks, and gave their name to sleight-of-hand and conjuring tricks. But the name seems to have been also current as a generic term for astrologers in the East, as is

MAGIC — MAGIC SQUARE

evidenced by the New Testament narrative of the homage of the Magi to the Infant Christ. According to the narrative (Matt. ii. 1-12) the three wise men came from the East to Jerusalem, led by a star, which at length guided them safely to the place of the Nativity at Bethlehem, where they offered their gifts of gold, frankincense, and myrrh. As the "Three Kings" their names became celebrated in the Middle Ages, and Bede distinguishes them as Kaspar, Melchior, and Balthasar. See also PARSEES; ZOROASTER.

Magic, or Black Art, was formerly the means of producing supernatural effects with the assistance of evil spirits. Supernatural effects were at an early period naturally associated with the exercise of the healing art. In the rudest stages of society this was confined to the women, and naturally arrived at the dignity of a profession in the hands of the older, whom experience had gifted with superior skill. As their art was for the most part a mystery to themselves, they gradually came to be regarded as objects of fear as much as of hope, and magic medicines became synonymous with poison. The sorceress, poisoner, and witch were in time reckoned identical. (See WITCHCRAFT.) Media, Persia, and the neighboring countries, famous for their knowledge of astronomy and astrology, are described as the chief seats of the ancient Magi, whose doctrine seems to be, in part, of great antiquity. This doctrine represented opposition or strife as the parent and original cause of all things. After the opposition between light and darkness, Ormuzd and Ahri-man, was established, the whole series of finite beings, the whole sensual world, proceeded from this constant struggle of light and darkness, good and evil. The change of day and night, light and darkness, the whole series of ages, time itself, is only a consequence of this struggle, in which sometimes light, sometimes darkness, appears victorious, until finally light shall conquer for ever. If all finite things stand under the influence of preserving and destroying powers in nature, it is clear that he who could master these powers could dispose at his pleasure of the things subject to them; and the doctrine of the Magians was that by prayer and a true knowledge of those laws of opposition, love and hatred, light and darkness, such power could be obtained; and that thus also it was possible to pry into futurity. But it was believed that as the world became sinful the light of the ancient doctrine of the Magi was obscured, and those who bore the name became at last only evil-disposed sorcerers. One important branch of their art was now the excitement of love by potions and enchantments. Their love-potions consisted partly of ingredients which are still known to the physicians as stimulants, partly of parts of animals who had died longing for food or air, or the saliva of hungry dogs, and other still more disgusting substances. Magic at this period also occupied itself with fortune-telling, calling up the dead and bewitching by the look—a superstition which we find existing in the processes against witches in modern times. It can hardly be doubted that the art of the ancient magicians was founded to a considerable degree upon a knowledge of the powers of nature superior to that of the general public. At one time magic was greatly

studied in Europe, and many distinguished names are found among its students and professors. The most famous of these are Albertus Magnus, Roger Bacon, Cornelius Agrippa, Michael Nostradamus, John Dee, William Lilly, etc. Consult: Ennemoser, 'History of Magic'; Scott, 'Demonology and Witchcraft'; Mackay, 'Memoirs of Extraordinary Popular Delusions'; Regnault, 'La Sorcellerie, ses Rapports avec les Sciences biologiques' (1897); Lehmann, 'Aberglaube und Zauberei' (1898).

Magic Lantern, an optical instrument for the enlarged representation of small figures. The instrument consists of a lantern, generally of tin, and cubical in form, having in the interior a powerful Argand lamp, the pencils of light issuing from which pass through a convex lens. It is most commonly used as a toy, but it is also valuable for the purposes of science in enlarging astronomical and other diagrams to illustrate lectures, so that they may be seen by an audience. The principle of its construction is very simple. A lamp is placed within the closed lantern with its burner in the focus of a concave mirror, the reflected light from which passes through a horizontal tube on a level with the flame. This tube contains two lenses, the one a hemispherical illuminating lens, of short focus, to condense a strong light on the picture, and the other a double convex lens, which receives the rays after they have passed through the picture, and throws them on the screen. The picture is inserted through a transverse slit into the tube between the lenses. That the representation may appear erect the picture must be inserted into the tube in an inverted position. The screen must not be too far removed from the lantern, otherwise the image will become indistinct and distorted. The tube is made to pull out, so that the distance of the lens from the slider being capable of being increased or diminished, an image of any moderate size, larger or smaller, may be formed, by increasing or diminishing the distance between the lantern and the screen.

Magic Square, in mathematics, a term applied to a series of numbers in arithmetical progression, arranged in the equal cells of a square, in such a manner that the vertical, horizontal, and diagonal columns shall give the same sums. The methods given for constructing them are divided into different rules, but no general method has yet been found that shall apply to all cases. The first sixteen numbers are arranged as a magic square in the annexed table:

1	16	11	6
13	4	7	10
8	9	14	3
12	5	2	15

There are said to be 880 methods of making these magical squares, and only those squares are included which are essentially different.

LAKE MAGGIORE.

"Magic circles," "cubes," "cylinders," etc., are also constructed.

Maginn, ma-gin', William, Irish author: b. Cork, Ireland, 11 Nov. 1793; d. Walton-on-Thames, 20 Aug. 1842. He was graduated from Trinity College, Dublin, in 1811, and was for some years a school-master. In 1819 he became a contributor to 'Blackwood's Magazine' and was in turn Paris correspondent of the 'Representative,' junior editor of the 'Standard,' and one of the founders of 'Fraser's Magazine,' his contributions to which made it famous. He was a man of superb classical education, excelled as a critic, and his literary work abounded in rich fancy and the genuine Irish wit. Unfortunately he had no financial ability and he died in extreme poverty notwithstanding the large sums his pen had earned. His collected works were published in 5 vols. in 1855-7.

Magistrate. See COURT.

Magliabecchi, Antonio, än-tō'nē-ō mäl-yä-bëk'é, Italian bibliographer: b. Florence 28 Oct. 1633; d. there 4 July 1714. In the early part of his life he was engaged in the employment of a goldsmith, which he relinquished to devote himself to literary pursuits. Through unremitting application he acquired a multifarious stock of erudition, which made him the wonder of his age. Duke Cosmo III. made Magliabecchi keeper of the library which he had collected, and gave him free access to the Laurentian Library and the oriental MSS., and of the latter collection he published a catalogue. He left no literary work, but freely afforded information to authors who sought his assistance in their own undertakings, his prodigious memory enabling him to furnish the exact reference to any page or paragraph of the numberless volumes he had read. He left his valuable private library of 30,000 volumes to his native city where it now forms part of the National Library.

Magna Charta, mäg'nä kär'tä, or **Great Charter of Liberties**, a famous document extorted from King John of England by the confederated barons in 1215. The barons who with their followers composed "the Army of God and the Holy Church" were the whole nobility of England; their followers comprehended all the yeomanry and free peasantry, and the accession of the capital was a pledge of the adherence of the citizens and burgesses. John had been obliged to yield to this general union, and in June both parties encamped on the plain called Runnymede, between Windsor and Staines, on the banks of the Thames, and conferences were opened between the king and his barons. The preliminaries being agreed on, the barons presented heads of their grievances and means of redress, in the nature of the bills now offered by both houses for the royal assent. The king, according to the custom which then and long after prevailed, directed that the articles should be reduced to the form of a charter, in which state it issued as a royal grant. The charter was signed on 15 June. Copies were immediately sent to every county or diocese, and ordered to be read publicly twice a year. To secure the execution of the charter John was compelled to surrender the city and Tower of London, to be held by the barons till 15 August, or until he had completely executed the charter. Many parts of the charter were pointed against

the abuses of the power of the king as lord paramount; the tyrannical exercise of the provisions of the forest laws was checked, and many grievances incident to feudal tenures were mitigated or abolished. But beside these provisions it contains many for the benefit of the people at large, and a few maxims of just government, applicable to all places and times, of which it is hardly possible to overrate the importance of the first promulgation by the supreme authority. The 39th article contains the celebrated clause which forbids arbitrary imprisonment and punishment without lawful trial. This article contains the writ of *habeas corpus* and the trial by jury, the most effectual securities against oppression which the wisdom of man has devised, and the principle that justice is the debt of every government, which cannot be paid without rendering law cheap, prompt, and equal. The provision which directs that the supreme civil court shall be stationary, instead of following the king's person, was an important safeguard of the regularity, accessibility, independence, and dignity of public justice in Great Britain. The Great Charter was frequently confirmed: four times by Henry III., and no fewer than 13 times by Edward III. Consult Stubbs, 'Constitutional History of England' (1897).

Magna Græcia, grë'shî-a, "Great Greece," the name commonly given in ancient times to that part of southern Italy which was inhabited by Greek colonists. Apparently the name was in use as early as the time of Pythagoras (586-506 B.C.). Strabo includes the Greek cities of Sicily under the appellation, but the name refers generally only to the Greek cities in the south of Italy, including those on the shores of the Tarentine Gulf and the Bruttian Peninsula, with Velia, Posidonia, and Laüs, on the west coast of Lucania. The name was not at first territorial, or co-extensive with any region, but applied merely to the Greek cities on the coasts. Cumæ was the most ancient of all the Greek settlements in Italy, but from its remote position it was in a great measure isolated from the later Greek settlements. The Achæans were the real colonizers of southern Italy, their first settlement being Sybaris (720 B.C.). A few years later (708 B.C.) Spartan colonists founded Tarentum, and to counteract their encroachments the Achæans founded Metapontum, on the frontier of the territory of the Tarentines, between 700 and 680 B.C. The Locrians founded further south the city known as Locri Epizephyrii, nearly contemporary with Crotona (710 B.C.). The Chalcidic colony of Rhegium, on the Sicilian Straits, claims to have been more ancient even than Sybaris. The Greek cities on the shores of Bruttium and Lucania were, Velia excepted (540 B.C.), offshoots from the earlier settlements, and not founded by colonists direct from Greece. The arrival of Pythagoras at Crotona (530 B.C.) produced a marked change in the cities of Magna Græcia, and led to the introduction of great political changes. He and his followers were ultimately expelled from Crotona. Magna Græcia comprised the provinces of Campania, Apulia, Iapygia, Lucania, and Bruttium.

Magnalia Christi Americana, mäg-nä'li-a krîs'ti ä-mer-i-kä'na, an 'Ecclesiastical History of New England, from 1620 to 1628,' pub-

MAGNENTIUS—MAGNESIUM

lished by Cotton Mather in 1702. It treats more extensively of the early history of the country than its title seems to indicate, and is divided into seven books: the first treating of the early discoveries of America and the voyage to New England; the second is 'Lives of the Governors'; the third, 'Lives of many Reverend, Learned, and Holy Divines'; the fourth, 'Of Harvard University'; the fifth, 'The Faith and the Order in the Church of New England'; the sixth, 'Discoveries and Demonstrations of the Divine Providence in Remarkable Mercies and Judgments on Many Particular Persons'; the seventh, 'Disturbances Given to the Churches of New England.' In the sixth book, the author gives accounts of the wonders of the invisible world, of worthy people succored when in dire distress, of the sad ending of many wicked ones, and of the cases of witchcraft at Salem and other places.

Magnentius, mǎg-nĕn'shĭ-ŭs, **Flavius Popilius**, Roman imperial usurper of the West: d. August 353. Having been entrusted by Constantians with a high military command he availed himself of his office to plot the emperor's overthrow. On 18 Jan. 350, presenting himself in imperial purple at a great banquet given by one of the conspirators at Autun, he was saluted with the title of Augustus; and assassins sent for the purpose having despatched Constantians, Magnentius was acknowledged as emperor by all the western provinces except Illyria. Constantius, on hearing of his brother's murder, hastened from the confines of Persia and defeated Magnentius (351). These disasters led to the defection of all the countries that had recognized the usurper, who thereupon committed suicide.

Magne'sia, the oxid of magnesium, MgO . See **MAGNESIUM**.

Magne'sian Limestone, a rock consisting of the mixed carbonates of lime and magnesia. Mineralogically it is known as **Dolomite** (q.v.).

Magnesite, a white, porcelain-like mineral (magnesium carbonate, $MgCO_3$; carbon dioxide 52.4 per cent, magnesium oxide 47.6 per cent), usually found associated with serpentine, talcose slates, and dolomite. The magnesite of commerce comes from several localities; notably, Veitsch in Styria, Austria, where it occurs in conformable beds in a Silurian formation; at Frankenstein in Silesia, where a very pure variety is found; at Bolton, Canada, there is a ledge 60 feet wide which is tinged with green by chromium. The quality, however, is not good. In the Red Mountain mining district, Santa Clara and Stanislaus counties, Cal., is found the largest known deposit in the world. Here there are several ledges from 20 to 60 feet wide and of very pure quality. It is also found in Napa, Sonoma, Fresno, Placer, Mariposa, Monterey, and San Luis Obispo counties, Cal. Magnesite is used as a bleaching agent in paper-making, and for making an excellent artificial stone for interior decoration. Its chief use, however, is in the manufacture of firebrick. In brick-making it is calcined, the gas CO_2 being collected and sold for charging mineral water and for use in cold-storage plants, instead of ammonia, and the resulting magnesium oxide mixed with a binding material and pressed into brick. From the pure mineral metallic mag-

nesium and salts, as Epsom salts and magnesium chloride, are manufactured.

O. H. PACKER.

Magne'sium, a metallic element whose compounds are abundant and widely distributed, but which does not occur, in nature, in the metallic form. Magnesium resembles calcium in its chemical department, and the oxides of the two metals were long confused with each other. Metallic magnesium was first prepared by Davy, in 1808, both by electrolysis, and by the reduction of white-hot magnesia in an atmosphere of potassium vapor. In 1830 Bussy obtained a larger and purer yield of the metal, by heating a mixture of potassium and anhydrous magnesium chloride to redness. It is best prepared by the electrolysis of the fused anhydrous chloride, or of a mixture of magnesium chloride with the chlorides of sodium, potassium, and ammonium. Pure magnesium is silvery-white in color, lustrous, and moderately hard. It may be hammered, rolled, filed, and polished. Its specific gravity is about 1.70, and its specific heat about 0.245. Its melting point is variously given, the estimates ranging from $850^\circ F.$ to nearly $1,500^\circ F.$ When raised to a bright-red heat (out of contact with the air) it volatilizes, depositing upon cool surfaces again in the form of lustrous silvery crystals which belong to the hexagonal system, and are isomorphous with those of zinc. It expands by 0.000015 of its own length, per Fahrenheit degree of rise of temperature; and at $32^\circ F.$ its electrical resistance is 0.0438 of that of mercury.

Chemically, magnesium is a dyad. It has the symbol Mg , and an atomic weight of 24.36 if $O=16$, or 24.18 if $H=1$. Its most important compounds are the oxid, MgO , the chloride, $MgCl_2$, the sulphate, $MgSO_4$, and the carbonate, $MgCO_3$. Metallic magnesium is not altered upon exposure to dry air, but ordinary air oxidizes it superficially. It dissolves readily in dilute acids, with the formation of the corresponding salts. Chlorine, bromine, iodine, fluorine, sulphur, phosphorus and arsenic combine with it directly. Red-hot metallic magnesium also slowly combines with free nitrogen to form a solid nitride. In the isolation of argon, helium, and the other rare gases of the atmosphere, advantage is taken of this fact for separating these gases from the nitrogen of the air. (See **ARGON**.) When strongly heated in the air, metallic magnesium takes fire and burns with an exceedingly brilliant white light that is rich in chemical rays; the product of the combustion being magnesia, MgO . Advantage is taken of this property in photography, most of the "flash-light" powders that are used consisting essentially of pulverized magnesium, either alone, or mixed with a small quantity of some explosive or oxidizing agent. Magnesium will also burn when sufficiently heated in steam, carbon dioxide, or sulphur dioxide.

Magnesium oxid, or "magnesia," MgO , is usually prepared by heating the nitrate or carbonate of the metal; and on account of this method of preparation it is commonly known as "calcined magnesia." Magnesia is a white substance, without taste or odor. It does not have a strongly alkaline reaction, but it acts as a powerful base, reacting with acids to form the magnesium salts. It is scarcely soluble in water, but it slowly absorbs moisture and carbon

MAGNETIC DIP—MAGNETISM

dioxid from the air, becoming converted into a mixture of the hydrate and carbonate. When made into a paste with water, magnesia sets to a hard, white mass, consisting partly or wholly of the hydrate, $\text{Mg}(\text{OH})_2$; but this action does not occur if the magnesia has been previously heated to whiteness. One of the most distinctive characteristics of magnesia is its infusibility. Even when heated in the flame of the oxyhydrogen blowpipe it does not melt, but gives out a bright white light, somewhat similar to that emitted by lime. (See CALCIUM LIGHT.) In the fiercer heat of the electric furnace, magnesia has been melted. On account of its infusibility, magnesia is used in the manufacture of crucibles and of firebrick. It occurs native as the mineral periclase, which crystallizes in the isometric system.

Magnesium chloride, MgCl_2 , is prepared by dissolving magnesia in hydrochloric acid, and evaporating the solution after the addition of a certain quantity of sal ammoniac. Upon subsequent fusion the sal ammoniac volatilizes, and the magnesium chloride is left behind. This substance is largely used as a preventive of mildew, in the sizing of cotton cloth. The mineral carnallite contains magnesium chloride, having the composition $\text{MgCl}_2 + \text{KCl} + 6\text{H}_2\text{O}$. Magnesium sulphate occurs native (in combination with one molecule of water) as kieserite, and it may also be prepared artificially by dissolving magnesium oxid or carbonate in dilute sulphuric acid. When combined with seven molecules of water, magnesium sulphate constitutes the familiar substance known as Epsom salts (q.v.), which is largely used in medicine. Magnesium carbonate, MgCO_3 , is a white substance, insoluble in water, but soluble in a solution of ammonium chloride, and also in water that contains carbon dioxid in solution. It occurs in nature as the mineral magnesite, which crystallizes in rhombohedral forms, isomorphous with calcite. Dolomite, which occurs in nature in enormous quantities, is a carbonate of magnesium and calcium.

Magnesium salts are used to a considerable extent in medicine. The name "magnesium" is derived from "magnesia," which substance is said to have been obtained from the province of Magnesia, in Thessaly.

Magnetic Dip. See DIPPING NEEDLE.

Magnetic Moment. See MAGNETISM.

Magnetic Pole. See MAGNETISM.

Magnetism, the name applied to a peculiar force action first observed in connection with certain iron ores. This ore, often called lodestone, is supposed to have been discovered in Magnesia, a part of Asia Minor. It is not possible to state just when this discovery was made, but certain passages in Lucretius show that something was known concerning it before the beginning of the Christian era. About the year 1200 we have the statement by Neckham that a lodestone free to turn takes up a definite position in space. Some further details were noted by Peregrinus (1269) and Ferrara (1629), but the greatest of the early works is that of Dr. Gilbert, a physician, who published his 'De Magnete' in 1600. Those interested in the history of the subject may consult the 'Intellectual Rise of Electricity' by Park Benjamin, in which an excellent historical sketch may be found.

The only direct evidence that a body is magnetic is its ability to exert a force on certain substances, which, by reason of their susceptibility to this action are called magnetic substances. A lodestone brought in contact with several small bodies will select those of iron or steel, if such be present, but show no appreciable force on copper, lead, wood, or in fact on any except iron, nickel, cobalt, and a few others to a lesser degree. Of even greater interest and importance is the fact that the lodestone is able to endow steel or iron with the ability to exert this force. Soft iron loses its external magnetic qualities when removed from the immediate neighborhood of the exciting source, but hard steel or iron will retain this property for a long time. If a bar or rod of hard steel is drawn across a piece of lodestone or other permanent magnet, and is then suspended so as to be free to turn about a vertical axis it will take up a definite position, usually its line of greatest length will be approximately north and south. If it be plunged into a box of iron filings, little magnetic action will be manifest near the middle of the bar, but near the ends considerable quantities of filings will be attracted and may be lifted against the action of gravity. These facts led to the naming of the regions of greatest external action the poles of the magnet and since the lines joining these regions would, in the case of a freely suspended magnet, lie in many places nearly north and south, the pole which seeks the north is often called the north-seeking or positive pole, the other which turns toward the south, is correspondingly named the south-seeking or negative pole. The entire subject was formerly studied with reference to the behavior of like and unlike poles, and it was even supposed that these poles consisted of opposite sorts of magnetic matter. Later investigations have developed methods less directly dependent upon the idea of poles, which are preferable for many purposes.

FIG. 1.

If we suppose two long magnets placed as shown in Fig. 1 a study of their mutual force action would indicate that each is exerting a push tending to increase the distance between them, and that the amount of this repulsion will vary with the distance between the magnets. If one of the bars be replaced by another whose magnetic quality is different, the force action will be modified. If one of the magnets be reversed in position a corresponding force tending to reduce the distance between the bars would be observed. It is convenient to use as a preliminary definition the statement that a unit pole is one which would exert unit force upon a precisely equal pole at a distance of one centimetre. The law of pole action can then be stated by saying that the force is equal to the product of the two poles strengths divided by the square of the distance between the poles.

If a freely suspended magnet is brought into the neighborhood of a large bar magnet as indi-

MAGNETISM

eated in Fig. 2 it will be observed to take up a position somewhat as indicated in the lower part of this diagram, as its point of suspension is moved along the line. The region where this directive force is noticeable is called the *field* of the magnet. (Gilbert's "orb of virtue.") If continuous lines are drawn, which at each point have the direction taken by the free magnet,

FIG. 2.

these lines are called lines of magnetic force, and they offer a very convenient method for a general study of magnetic action. While these lines have no objective existence, it is, nevertheless, desirable to imagine that they are real and that they possess certain definite qualities. They should always be considered as being directed away from the north-seeking or positive pole. In the early conception of magnetic action these lines would have been regarded as the lines of flow of the magnetic material, and the word *flux*, still in use, bears evidence of this conception. It is convenient also to regard the lines of force as being under tension and capable of repelling each other. The number of actual lines of force which could be drawn about a magnet is infinite. For purposes of comparison, however, it is customary to represent the force action at a point upon the unit pole placed at that point by the number of lines drawn per square centimetre on a surface perpendicular to the field. A unit field is one in which a force action upon a unit pole is one dyne, about the weight of 1-1000 of a gramme.

In order to compare magnets and to facilitate magnetic computations, certain methods of measurement have been devised. Only a brief sketch can be given here, as full details of these operations may be found in books devoted to this subject, some of which will be mentioned at the end of this article. When a bar magnet is placed at right angles to the lines of a uniform magnetic field it will experience a twist tending to place it along these lines. The amount of this twist will depend upon three things. First: The pole strength of the magnet in question. Second: The distance between the poles. Third: The strength of the field where it is placed. The product of the pole strength by distance between poles is called the magnetic moment of the magnet. When a magnet is suspended freely and slightly displaced from a position parallel to the lines of force it will vibrate about this position. The time required for a complete swing is found to depend upon the magnetic moment, the moment of inertia, and the strength of the field where the magnet is placed. The vibration period may be directly observed and the moment of inertia computed from the dimensions and weight of the magnet. In this way the product of the magnetic moment by the field strength may be found. If the same magnet is held with the line joining its poles East and West it will cause a small freely sus-

pended magnet some distance to the east or west to turn slightly from its equilibrium position. The amount of this deflection depends on the distance between the magnets and the ratio of *magnetic moment to field strength*. If we denote the magnetic moment by ml and the field strength by H , the product of ml times H is found, from time of vibration, and by means of the deflection of the small auxiliary magnet $ml \cdot H$ may be determined. When ml times H or ml divided by H is known either ml or H is readily computed. When the field at any point is known, a comparison of the time of vibration of a magnet at the known point with its period when vibrating at any other point enables us to compare the two fields without further measurement. The law of change being that if periodic time is doubled the field strength would be four times as great; or the period varies inversely as the square root of the field in which the magnet vibrates.

The facts mentioned above regarding the ability of a magnet to cause pieces of neutral iron or steel to show magnetic properties is frequently spoken of as magnetic induction. The general phenomena can be readily remembered if we imagine that it is easier for lines of magnetic force to pass through iron than through air. Small pieces, as shown at P, Fig. 2, would have lines entering at "S" and leaving at "N" and would behave as small magnets placed in corresponding positions. Owing to the tension of the lines of force these small pieces would tend to set themselves nearly parallel to the undisturbed direction of the lines. If a sheet of glass or other non-magnetic material is placed over a magnet and iron filings are sprinkled on its surface, a slight tapping, sufficient to overcome friction, will enable the lines of force to arrange the small temporary magnets parallel to the field. In this way maps of magnetic fields may be readily found, and their study throws considerable light upon many de-

FIG. 3.

FIG. 4.

tails of these peculiar phenomena. Such fields are shown in Figs. 3 and 4. If a sphere of iron or cobalt is free to move in a magnetic field which is not uniform, a tendency is always ob-

MAGNETISM

served for the iron to place itself in the strongest part of the field, or so that as many of the magnetic lines pass through it as possible. Such a substance is called paramagnetic. Some substances, as for example a sphere of bismuth, will tend to move to the weaker portions of the field, indicating that it is more difficult for magnetic lines to pass through the material than through air. These are called diamagnetic bodies.

The importance of magnetic action in both theoretical and practical affairs is due largely to its intimate connection with the phenomena of the electric current. In fact it is absolutely impossible under any conditions to have an electric current flow in a conductor without producing a magnetic field. In the case of a long straight wire carrying current the magnetic lines are circular in form, concentric with the wire, and their planes are perpendicular to its axis. If a wire is wound in a long, straight, cylindrical coil, frequently called a solenoid, and a current be passed through it, the field produced will be nearly identical with that of a bar magnet, the difference being that the lines of force are entirely in air and are not modified by the peculiar properties of iron. By increasing the strength of the current and the number of turns of wire, a comparatively strong magnetic field may be produced at the centre. A piece of soft iron or steel inserted in the coil becomes a powerful temporary magnet, while strips or bars of hardened iron or steel would in the same way become permanent magnets. The requirements of modern electrical processes have led to very careful investigations of the magnetic behavior of iron in connection with the production and the measurement of electric energy. Only a brief sketch of the fundamental features can be given here. If we suppose an electric current flowing in a long solenoid, which does not contain an iron core, the strength of the magnetic field through the inside of the solenoid may be readily computed from a knowledge of the number of turns of wire and the strength of the current. The symbol H is generally used to indicate the field strength when iron is absent. If now a bar of iron be inserted it will be found that the magnetic field is greatly increased. The new field will depend partly on the original value of H and partly on the quality and previous magnetic history of the iron inserted. The symbol B is generally used to denote the intensity of the field when iron is present. It may then be stated that B equals μH , where μ is a variable factor depending on the nature of the iron and the field strength; this factor is called the *permeability*. The original field H is frequently spoken of as the magnetizing field and the new one as the induction. Or H stands for the number of lines per square centimetre where iron is absent and B stands for the number of lines per square centimetre in the iron. If iron, in a neutral magnetic condition, is placed in a solenoid and the electric current is gradually increased from zero the iron will be subjected to a steadily increasing magnetizing field. A comparison of corresponding values of B and H in such a case leads to very important results. The relation between these values is best explained by reference to a curve drawn by using these quantities as co-ordinates. Such curves, usually called the curves of magnetization, are shown in Fig. 5. It should be observed

that when H is almost zero, the induction is very small, then B increases more and more rapidly with a rising field until at point 2 the rate of increase of B with H begins to fall off

Fig. 5.

rapidly, and shortly a value of B is reached which cannot be materially increased no matter how strong a magnetizing field is used. For example in the specimens shown it is useless to extend the value of H much above 70, and in actual practice this limit would be taken much lower. When as many lines as possible are carried through the iron it is said to be saturated. The exact shape of the magnetization curve will depend upon the nature and previous magnetic history of the specimen, but the ratio B/H at any point gives the ability of the iron to multiply magnetic field strength for that particular field. If, however, any definite state of magnetization is attained as at the point M, Fig. 6, it will be found that upon reducing the field, H , the values of the induction, B , will not agree with those found for the same value of H when the field was increasing. In fact if H be changed to zero and then to negative values and back again to the former condition the value of B will form a loop as indicated. This peculiar lag of the induction when the field is reduced, is called hysteresis, and the hysteresis loop as shown is of practical importance because its area enables one to find the work converted into heat when the magnetization is carried through one complete cycle. The line ON measured the residual magnetism, which is semi-permanent, and will be greater in hard than in soft iron or steel. No matter where the process of magnetization is stopped a series of cyclic changes of the magnetic field always gives corresponding loops.

A theory which is useful in the correlation of the various phenomena observed in the magnetic behavior of iron is at once suggested by a simple experiment. Take a magnetic steel needle and which shows distinct polarity. Upon being broken into two parts it will be found that instead of securing two isolated poles, that

MAGNETISM

each piece possesses a plus and a minus pole practically identical with the poles of the original needle. Carry this process to any length and each little piece, however small, will be found to possess two poles, one positive and the other negative. If we assume that this process could be carried on to the smallest conceivable particle of the iron we should say that each molecule of the iron is by itself a magnet. We may further suppose that the molecular mag-

observed that there is a tendency for free positive poles to appear at one end, namely where the field lines leave the iron and for uncompensated negative poles to appear at the other end.

Fig. 8.

Fig. 6.

nets in a neutral piece of iron are entirely devoid of regular arrangement as regards position of the poles; such a chaotic condition may be indicated roughly by Fig. 7. It may be supposed that these molecular magnets are partly held in position by the action of forces analogous to friction, which also tend to hold them in any new position to a greater or less extent in case the original arrangement is disturbed. Under the action of a weak magnetic field these friction forces would prevent the turning of the molecular magnets into parallelism with the

Fig. 7.

field lines. As soon as the field is strong enough to overcome this sort of friction we might expect the same tendency to arrangement of these minute magnets that is observed in the case of iron filings in the mapping of magnetic fields. As long as a considerable number of the axes of these molecular magnets make fairly large angles with the field lines the leverage by which turning is produced would be considerable; if however they approach parallelism with each other and the field lines, the effective twisting would be very materially reduced. This would correspond to the approximate saturation of the iron and no considerable change in position could be produced by increasing the field strength. The general arrangement may be indicated approximately in Fig. 8, where it will be

The facts in favor of this sort of explanation may perhaps be briefly summarized as follows: (1) The general shape of the magnetic curve is explained. (2) As friction or other molecular forces tend to prevent a return to the original chaotic condition after magnetization this arrangement would in part persist after removal from the field, or permanent magnetism would be explained. (3) Soft iron should be easier to magnetize and less permanent than hardened iron or steel. (4) Jarring as by blows tends to reduce friction and to assist in the process of magnetization and also to reduce permanent magnetism. (5) High molecular activity consequent on rise of temperature decreases magnetic action, in fact, at a dull red heat iron is non-magnetic. (6) Rapid reversals of magnetism involves work against molecular forces and the production of heat, this heat is proportional to the area of the loop. (7) A tube of iron filings or a set of pivoted magnets shows the same behavior in a rising or falling magnetic field as a solid bar. The precise agreement between experimental facts and the indications from theory shown above makes this conception extremely useful. Just why molecules of iron should be permanently endowed with magnetic properties is a subject for speculation which has been indulged in by numerous prominent scientists. It has been supposed for example that electrical currents flow around these molecules, that they consist of vortex rings or that small electrically charged parts are in vibration in such a way as to produce the phenomena of permanent molecular magnetism. The general usefulness of the hypothesis is in no way connected with the truth or falsity of such speculations any more than the facts regarding free fall are dependent on our view of gravitation.

The general statements noted above regarding magnetism of iron are of importance in the manufacture and utilization of magnets for various purposes. Where a considerable amount of permanent magnetism is undesirable, soft iron or steel is always used. For the manufacture of permanent magnets special steel is selected and hardened and is then magnetized by its insertion into a solenoid carrying a powerful electric current. Severe shocks or blows are frequently given in order to assist in the molecular rearrangement. The interaction of all the elementary magnets together with temperature changes and mechanical shocks will tend to weaken a magnet. This loss is very considerable at first but finally an almost permanent state is reached. When used in electrical measuring instruments magnets are artificially aged by subjecting them to considerable changes of temperature and a series of mechanical shocks. It should be noted in this connection that the permanence of the magnet will be somewhat increased by joining its poles, when not in use.

MAGNETISM

by a piece of soft iron. The induced magnetism at the ends of the iron helps to hold the poles of the small molecular magnets in position, and counteracts the tendency of these poles to demagnetize the bar.

Aside from the extended use of permanent magnets in electrical instruments their practicable application is comparatively limited. The electro-magnet is widely used where it is desired to cause a temporary force action at a distance from the operator, as for example in the telegraph, etc. Powerful electro-magnets are now frequently used to lift large masses of iron during manufacturing processes. It may be noted in this connection that the lifting force of a magnetic piece of iron depends on the square of the number of lines per unit area at the contact face. Only so large an area should be used in contact as can be very highly magnetized by the current available. In the construction of dynamos, motors and transformers, the magnetic quality of the iron used is of great importance. The total number of lines set up (flux) must be sufficient for the operations involved and saturation should not be approached in any part. Where the cross section may be made large, cast iron can be used, but where the flux must be concentrated, special soft iron or steel is required. All air gaps are made as small as mechanical and electrical considerations of construction will permit, in order that the required flux may be more easily set up by the electro-magnets. Or as electrical engi-

neers say, the magnetic "reluctance" is made small by use of properly proportioned iron parts and small air gaps in order that the *magneto-motive force* required may not be excessive.

Terrestrial Magnetism.—The statement usually made that a freely suspended magnet needle, remote from magnetic masses, tends to point north and south is not correct except for a few localities at certain times. The actual nature of the earth's magnetic field must be found by extended experiments which are being carried on by numerous observers largely under the direction of various governments. (See methods of magnetic measurements above.) If a steel needle be suspended by a silk fibre and carefully balanced so as to hang horizontal and is then magnetized it will be observed to finally come to rest in a certain vertical plane and to be inclined to the horizontal. The angle between a horizontal line and the direction of the needle is called the dip, and the angle between the true north and south plane and that in which the needle lies is called the declination. The values of the dip, declination and intensity of the earth's field at a point are called the magnetic elements at that point. The use of the compass both by the surveyor and mariner over nearly the entire surface of the earth makes an accurate knowledge of these elements indispensable. In order to convey this information, in a practical way, recourse is had to maps on which places having the same declination, for example, are joined by lines. Such maps bring into view many interesting features as regards the earth's magnetism. For example Fig. 9, published by the United States Coast and Geodetic Survey for 1900 shows that in northern Oregon, Idaho and Montana the compass pointed approximately 20 degrees east, while in the extreme northeastern part of Maine it pointed about 20 degrees west. Along an irregular line crossing Michigan, Ohio, North and South Carolina and passing east of Cuba the declination was 0, or the needle pointed due north. It is evident from an inspection of these maps that the poles of the earth considered as a magnet do not coincide with the geographic poles. The line of no dip follows the equator only approximately. North of this line the north end dips down, while at the south it is reversed. Some of the minor variations are no doubt caused by local causes, such as masses of magnetic material, but it is a general belief among observers that the earth's magnetism is largely due to outside agencies. Another very important point for the mariner, who depends on the compass to find his way in safety across trackless seas or the surveyor anxious to locate landmarks, is that these magnetic elements are continually changing even during the day, as well as month by month and year by year. In London during 232 years the declination changed 35 degrees. "A street one mile long laid out in London parallel to the compass direction in 1580 would have its terminus seven tenths of a mile too far east according to the compass in 1812." Since 1812 the declination at London has changed from about 24 degrees west to 16 degrees west. In 1580 it was 11 degrees east. In fact it would seem that the magnetic poles of the earth are slowly vibrating. The variation during the day must be taken into account in accurate work as a mile run in the morning and repeated in the afternoon, may vary by 5 to 20 feet at its terminus. Sudden changes called magnetic storms also frequently occur, which seem to be associated with atmospheric electrical conditions, sun spots, etc. In order to secure data for the study of these complex phenomena, magnetic observatories are maintained where delicate instruments record, day and night, the countless fluctuations of the magnetic forces.

The problem of the navigator is still further complicated by the use of iron ships which are always sources of disturbance, both because of their permanent as well as their variable magnetism. The continual jarring and changes of temperature during a voyage enables the earth's field to continually change the distribution of magnetism in the vessel. The means to be used for the correction of this deviation have received the attention of many skilful investigators. The limits of this article will hardly allow a discussion of the matter which may be found in special books noted at the end.

Fig. 9.

MAGNETISM — MAGNOLIA

The contrast between the state of knowledge regarding magnetism before 1600 and its present development is one of the most striking indications of the growth of scientific investigation. Instead of vague speculations, partial truths veiled in mysticism, more or less direct references to dogma and the supernatural, we have organized knowledge based on experience and constantly checked by experiment and application. The number of those who believe in "magnetic" healing or, that, because an iron pipe driven in the earth shows polarity, the water flowing through it is magnetic and has special medicinal virtues, is constantly on the decrease. The relations between magnetism and other fields of physical research can not be treated in this article, yet it may be well to mention that such relations are constantly being investigated and no one in touch with present developments believes that the end is at hand. And it may well be that the delicately poised magnetic needle in some future interpretation of its countless movements will give us a knowledge of the invisible yet all-pervading agency which governs its fluctuations and lead us to a broader generalization of physical phenomena than we can formulate at present.

Asst. Professor of Physics, Cornell University.

Magnetism, Animal. See ANIMAL MAGNETISM.

Magnetite, or Magnetic Iron Ore, native magnetic oxid of iron, Fe_3O_4 . It sometimes has part of its iron replaced by titanium or magnesium, and occasionally by nickel. It is very abundant (the production of the United States in 1901 being 1,813,076 tons), and when pure it constitutes a valuable ore of iron, 72 per cent of its weight consisting of that metal. Magnetite crystallizes in the isometric system, commonly in octahedra, but also in dodecahedra, with striated faces. It also occurs, and very generally, in massive and granular forms. It is black in color, with a metallic or submetallic lustre. It is brittle, and has a hardness of from 5.5 to 6.5; the crystals having a specific gravity of about 5.17. It may be readily distinguished by the fact that it is strongly magnetic. Specimens are found which manifest quite a strong, permanent magnetic polarity, this variety of the mineral being known as "lodestone." Magnetite occurs in vast beds in Canada, and in the northern and eastern parts of the United States. Abundant deposits of it are also known in California and Washington.

Mag'neto-elec'tric Machines. See ELECTRO-MAGNETIC MACHINE; ELECTROTHERAPEUTICS.

Mag'neto-elec'tricity. See ELECTRO-MAGNETISM; ELECTRO-MAGNETS.

Magnetometer, an instrument employed in observatories to measure the intensity of terrestrial magnetism. A magnet may be allowed to move freely in a horizontal plane by being supported on a fine vertical pivot, or by suspension on a fine untwisted silk thread. Bifilar suspension is more to be depended upon; the magnet is supported by two parallel threads; screws enable the tensions in the threads to be equalized and their distance asunder to be adjusted. See MAGNETISM (Terrestrial).

Magnificat. The words which Mary pronounced when she visited Elizabeth (Luke i. 46-55) begin, *Magnificat anima mea dominum* ("My soul doth magnify the Lord"). Hence the whole of her thanksgiving on this occasion has been called the Magnificat. The present usage of the Roman Catholic Church is to chant or pronounce the Magnificat every day at vespers.

Magnolia, Ark., town, county-seat of Columbia County; on the Louisiana & N. and the St. Louis S. R.R.'s; about 138 miles southwest of Little Rock. It is in an agricultural and lumbering region. Considerable cotton and fruit are raised in the vicinity. It has a large trade in lumber, fruit, and cotton. Its chief buildings are the county buildings, the schools, and churches. Pop. (1900) 1,614.

Magnolia, a genus of ornamental, deciduous or evergreen trees and shrubs of the order *Magnoliaceæ*. The 20 species are natives mostly of the United States, India, China, and Japan. They are characterized by large, alternate entire leaves, large white, purple or pink, sometimes yellowish, solitary, terminal flowers, which are often highly fragrant; and cone-shaped, often red, decorative fruits. They are widely planted for ornament in parks and gardens; most of the deciduous species being tolerably hardy as far north as Massachusetts, some even farther north, but the evergreen kinds tender even at Washington, where, however, one species (*M. grandiflora*), can withstand the winters if in protected situations. The wood is close-grained, generally soft, spongy, light and satiny. It is little used because it is not durable, but in Japan one species (*M. hypoleuca*), is used for lacquering. The bark and the fruits of a few species were formerly employed as stimulants and tonics, but have fallen into disuse.

As a rule, magnolias thrive best in rather rich, fairly open, moist, peaty or sandy loams, but generally prove satisfactory upon any garden soil. A few, especially the beaver tree (*M. glauca*), which is also popularly known as sweet, swamp, or white bay, are natives of very wet grounds and must be naturally well supplied with water, when planted for ornament. They may be propagated by means of layers, by grafts, or by seeds planted as soon as ripe or stratified in sand and kept out of doors where they can not become dry. The plants should be transplanted when the new growth is commencing, otherwise the operation is frequently unsuccessful.

The following species are among the most generally planted in the United States. The bull bay or big laurel (*M. grandiflora*) is found naturally from North Carolina to the Gulf States. It is a pyramidal, evergreen tree which, often attains heights of 75 feet or more, and is

especially conspicuous when in blossom, its fragrant white flowers often attaining a diameter of a foot. The swamp sassafras or sweet bay (*M. glauca*) ranges from the coast region of Massachusetts to Florida and irregularly southwestward to Texas. It reaches a height of 20 feet and bears fragrant cream-colored flowers. The cucumber trees (q.v.) are natives of the southeastern United States and are particularly attractive because of their pink fruits. The flowers of the first are often eight inches in diameter, and conspicuously colored; those of the latter are much smaller and greenish yellow, or green. Of the exotic species the yulan (*M. yulan*), a native of China, where it has been cultivated for more than a thousand years, and *M. pumila*, *M. obovata*, and *M. hypoleuca* are popular, the first and last particularly. By crossing, hybridizing and selection a large number of choice horticultural varieties have been produced.

Magoffin, ma-gōf'in, Beriah, American statesman: b. Harrodsburg, Ky., 18 April 1815; d. there 28 Feb. 1885. He was graduated from Centre College (Danville, Ky.) in 1835, from the law school of Transylvania University (Lexington, Ky.) in 1838, entered the practice of law at Jackson, Miss., in 1839, but in the same year returned to Harrodsburg. In 1840 he became police judge, in 1848, 1856, and 1860 was a delegate to the Democratic national conventions, in 1850 was elected to the State senate of Kentucky, and in 1859-62 was governor of Kentucky. He refused, 15 April 1861, to comply with Lincoln's call for 75,000 troops; in May 1861 by proclamation warned both the Confederate and Federal governments against occupying Kentucky soil, and the citizens of the State against entering hostilities; and in August requested Lincoln to withdraw United States troops. He vetoed a resolution of the legislature directing him to proclaim the evacuation of Kentucky by the Confederates; but the resolution was passed over his veto. In August 1862 he resigned his office, and in 1867 was elected to the lower house of the State legislature.

Magog, mā-gōg, Canada, town in Stanstead County in the province of Quebec; on Lake Memphremagog at its outlet, and on the Canadian Pacific; about 19 miles southwest of Sherbrooke. It has regular daily communications with Newport and other places in Vermont. Magog is a favorite resort for anglers. Pop. (1891) 2,100; (1901) 3,516.

Magog. See GOG AND MAGOG.

Mag'ot. See BARBARY APE; MACAQUE.

Mag'pie (originally *pie*, the pied or variegated bird), a bird of the genus *Pica*, closely related to the jays. The genus is distinguished by the extremely long wedge-shaped tail, the middle feathers of which equal the entire length of the head and body, while the outer feathers are less than half as long. The notorious magpie of Europe (*P. rustica*) is represented in North America by the variety *hudsonica*, which is rather larger but otherwise similar. The color is a lustrous black with a varied and changing iridescence and sharply contrasting white under parts and patches on the shoulders and wings, the latter being conspicuous as the bird flies. The yellow-billed magpie (*P. nuttalli*) of California, is precisely similar except that the bill

and a naked area at its base are yellow instead of black. Other species inhabit Asia and Africa. In America the common magpie is confined to the west, its range reaching from Alaska to Arizona and from the plains to the Cascade Mountains, being especially common in the Rocky Mountains. The magpie is a handsome bird of saucy, vivacious habits and is chiefly noted for its thieving habits and general rascality. It is always engaged in mischief, either in stealing brightly colored or glittering objects from the habitations of man or in robbing the nests of other birds, but because of its pert, merry manner is usually forgiven for the former class of offenses. The caged birds seen in the east give but a faint idea of the beauty and activity of these birds in the wild state. Like the jays the magpies are omnivorous, but are less strictly arboreal than they. The nest, which is built in a tree or bush, is very ingeniously and substantially constructed. It is a large domed structure protected outwardly by a thick, bristling layer of thorns and twigs, through which a narrow passage opening on one side leads to a deep cup plastered with mud and lined with fibres. Six to nine greenish drab eggs, much spotted and dashed with various shades of brown, are laid. The American magpie is occasionally taken young and made a pet, but it has not the reputation for talking and amusing, albeit thievish, manners which has made the European bird a favorite from ancient times. Descriptions of its many interesting habits will be found in the books of Coues, Ridgway, Merriam, Cooper, Keyser, and other writers upon the ornithology of the western United States.

Magrath', William, American painter: b. Cork, Ireland, 20 March 1838. He emigrated to the United States in 1855, and was elected National Academician in 1876. He has produced many excellent landscapes and his genre pictures are full of character. Among them may be mentioned 'The Road to Kenmare' (1871); 'The Reveillé' (1873); 'Rustic Courtship' (1877); 'On the Old Sod' (1879), which last is in the New York Metropolitan Museum.

Magruder, mā-groo'd'r, John Bankhead, American soldier: b. Winchester, Va., 15 Aug. 1810; d. Houston, Texas, 19 Feb. 1871. He was graduated at West Point in 1830, served for a short time in the 7th infantry, then in the artillery. In 1836 he was made first lieutenant, saw service in the Seminole war 1837-8, and became captain in 1846. He took an active part in the Mexican War, rising to the rank of lieutenant-colonel. In 1861, while in garrison at Washington, D. C., he resigned from the United States army, accepted a Confederate colonelcy, and commanded the artillery at Richmond. In the same year he won the battle of Big Bethel (q.v.), and was made brigadier-general and major-general. Assigned to the Yorktown district, he fortified the Peninsula, and with a force of 12,000 held it against the Army of the Potomac in April 1862. In the Seven Days' Battles (q.v.) he commanded the Confederate left. In October 1862 he was appointed commander of the Department of Texas. He recaptured Galveston 1 Jan. 1863, and broke the blockade of that port. After the War he served as major-general in the army of Maximilian in Mexico until the end of the empire, then settled at Houston for the rest of his life.

Magruder, Julia, American novelist: b. Charlottesville, Va., 14 Sept. 1854; d. Richmond, Va., 9 June 1907. Her literary career began in 1885 with 'Across the Chasm,' published anonymously. She wrote: 'A Magnificent Plebeian'; 'The Violet'; 'Miss Ayr of Virginia'; 'A Manifest Destiny'; 'Princess Sonia' (1895); etc.

Maguey, ma-gwá'. See **FIBRE**.

Maguindanao, mā-gēn-dā'now, a tribe of Moros who inhabit the valley of the Rio Palangui, island of Mindanao; the Moros of the Sarangani Islands, and some of those of Davao Bay belong also to this group. See **PHILIPPINE ISLANDS**.

Magyars, mō'gyōrz, the original name of the Hungarians, which they still use in preference to any other. See **HUNGARY**.

Mahā-bhārata, mā-hā-bhā'ra-ta, **The**, the greatest epic of the literature of ancient India. The name signifies 'The Great (Poem) of the Bhāratas.' The work is perhaps less truly an epic poem in a strict sense than a collection of epic material; there being a central narrative, but the constituent parts being assembled about it in rather a heterogeneous fashion; and many portions admitting of detachment without the slightest effect upon the poem. The composite authorship of the 'Mahā-bhārata' is indicated by the native ascription of it to Vyāsa, a generic title meaning an 'arranger' or 'distributor.' In its present state the epos consists of upward of 100,000 couplets of 32 syllables each; and is therefore about eight times more extensive than the combined 'Iliad' and 'Odyssey.' It is subdivided into 18 parvans, or books, with an appendix or supplementary portion called the 'Haravança.' Evidence exists to its currency under its present title as early as 350 B.C., but whether it was then in its present condition has not certainly been determined. Its origin is extremely remote. The main story of the poem concerns the feud between the Kauravas and Pāndavas; rival branches of the royal line of Hastināpura (Delhi), among whose ancestors was the King Bhārata from whom India is sometimes called 'The country of the Bhāratas' (Bhārata-varsha). The Pāndavas are represented as goodness and heroism personified; the Kauravas generally as inconceivable villains. A final war results in the complete victory of the Pāndavas. The episodic material which thickly overlays the central theme assumed an encyclopædic character; and the study of the 'Mahā-bhārata' became as much an education for the Hindu as that of the 'Iliad' and 'Odyssey' once was for the Greek. Much of the 'Mahā-bhārata' must to the general reader appear grotesque or even absurd. But, even so, it will continue remarkable for its vast scope, its lofty teachings, and the literary merit of many parts. The so-called *editio princeps* of the text is that of 1834-9 (Calcutta). There is also an edition of 1890. A rendering into English was begun by Protap Chunder Roy in 1883 and has been contributed to by other Hindus. Translations from it have also been made by H. H. Milman ('Nala' 1860) and Sir Edwin Arnold ('Indian Idylls' 1883). Consult: Monier-Williams, 'Indian Epic Poetry' (1863); Wheeler, 'The Vedic Period of the Mahā-bhārata' (1867); Goldstücker, 'Literary Remains,' Vol.

II. (1879); Wheeler, 'Short History of India' (1884). See **SANSKRIT LITERATURE**.

Mahadeva, mā-hā-dā'va, in Hindu mythology, a deity who shares the attributes of Siva in the Indian Trinity, Mahadeva being regarded as a generator as well as a destroyer.

Mahaffy, mā-hā'fī, **John Pentland**, Irish Greek scholar: b. Chapponaire, near Vevay, Lake Geneva, Switzerland, 26 Feb. 1839. He was educated in Germany and at Trinity College, Dublin, from which he was graduated in 1859; was appointed to a competitive fellowship in 1864; and became professor of ancient history in the college in 1871. In 1873 he was Donnellan lecturer. His first publication was a translation of Kuno Fischer's 'Commentary on Kant' (1866); and on philosophical subjects he has since issued 'Kant's Critical Philosophy for English Readers' (with J. H. Bernard 1872; new ed. 1889), containing a translation of the 'Prolegomena' and a defense of the critical philosophy; and a volume on 'Descartes' (1880) in Blackwood's 'Philosophical Classics.' The greater number of his works, however, treat of the history, literature, and everyday life of ancient Greece, among these being the following: 'Prolegomena to Ancient History' (1871); 'Greek Social Life from Homer to Menander' (1874); 'Greek Antiquities' (1876), a work much used in Continental schools; 'Rambles and Studies in Greece,' a record of antiquarian research (1876); 'Old Greek Education' (1879); 'History of Classical Greek Literature' (1880; 3d ed. 1891); 'Greek Life and Thought from Alexander to the Roman Conquest' (1887), a continuation of the work of 1874; 'The Greek World under Roman Sway' (1890), a continuation of the preceding; 'The Story of Alexander's Empire' (1890); 'Greek Pictures' (1890); and 'Problems in Greek History' (1892); 'The Progress of Hellenism in Alexander's Empire' (1905). He edited the English translation of Victor Duruy's 'Roman History' (1883-6); and has given some attention to Egyptian history, especially in the Greek period, the fruits of his studies in this field being his edition of the 'Flinders-Petrie Papyri' for the Royal Irish Academy (1891-3), and a work on the Empire of the Ptolemies (1896). He writes with particular interest and authority of the post-Alexandrian period of Greek life; and is continually discovering interesting parallels between that and modern civilization. What he may have sacrificed in pure scholarship he has gained in the vividness of his historical presentation. Among his other writings are: 'Twelve Lectures on Primitive Civilization' (1868); 'Report on the Irish Grammar Schools' (1880-1); 'The Decay of Modern Preaching' (1882); and 'The Art of Conversation' (1889).

Ma'aleb, a species of European cherry-tree (*Cerasus Mahaleb*), whose fruit affords a violet dye and a fermented liquor. Its flowers and leaves are used by perfumers, and its wood by cabinet-makers. See **CHERRY**.

Mahan, mā-hān', **Alfred Thayer**, American naval officer: b. West Point, N. Y., 27 Sept. 1840. He was graduated from the United States Naval Academy in 1859, and served during the Civil War, rising to the rank of lieutenant-commander in 1865. In 1885 he was promoted captain, and in 1886 was appointed president of

the Naval War College at Newport, a position which he held till 1888, and again from 1892-3. In 1893-5 he was commander of the Chicago, and in 1896 was retired from active service at his own request. In 1898 during the war with Spain he was a member of the Naval Board of Strategy; and in 1899 one of the United States delegates to The Hague Peace Conference. In 1890 he published his chief work, 'Influence of Sea Power upon History'; the continuation, 'Influence of Sea Power upon the French Revolution and Empire' appeared in 1892; his other writings include: 'The Gulf and Inland Waters' (1883); 'Life of Admiral Farragut' (1892); 'Life of Nelson' (1897), highly commended by English critics; 'The Interest of the United States in Sea Power' (1897), a compilation of his magazine articles; 'Lessons of the Spanish War' (1899); 'The Problem of Asia' (1900); 'The South African War' (1900); 'Types of Naval Officers' (1901); 'Retrospect and Prospect' (1902). His 'War of 1812' appeared in 'Scribner's' in 1904.

As a historian he has made a distinct contribution to historical science as the first writer to demonstrate the determining force which maritime strength has exercised upon the fortunes of individual nations, and consequently upon the course of general history. Technically, his representative work, the 'Influence of Sea Power upon History,' is but a naval history of Europe from the restoration of the Stuarts to the end of the American Revolution. But the freedom with which it digresses on general questions of naval policy and strategy, the attention it pays to the relation of cause and effect between maritime events and international politics, and the author's literary method of treatment, place this work outside the class of strictly professional writings and make it a recognized leading authority. His prime object, in establishing the thesis that maritime strength is a determining factor in the prosperity of nations, was to reinforce his argument that the future interests of the United States require a departure from the traditional American policy of neglect of naval-military affairs. Captain Mahan was president of the American Historical Association in 1902-3; and has received honorary degrees from several universities, including Oxford and Cambridge, England.

Mahan, Asa, American Congregational clergyman and educator: b. Vernon, N. Y., 9 Nov. 1800; d. Eastbourne, Sussex, England, 4 April 1889. He was educated at Hamilton College, Clinton, N. Y., and Andover Theological Seminary, and after holding pastorates at Pittsford, N. Y., and Cincinnati, Ohio, was president of Oberlin College 1838-50; and also professor of philosophy there. He was president of Cleveland University 1850-6; and of Adrian College, Mich., 1860-71. After the last named date he lived mainly in England. Among his works were: 'Doctrine of Christian Perfection' (1839); 'System of Intellectual Philosophy' (1845); 'The Will' (1846); 'Science of Logic' (1857); 'Mental Philosophy' (1882); 'History of Philosophy' (1883).

Mahan, Dennis Hart, American military engineer: b. New York city 2 April 1802; d. near Stony Point, N. Y., 16 Sept. 1871. He was graduated at West Point in 1824, where in 1825 he was appointed assistant professor of mathe-

matics and of engineering. He was stationed in Europe four years on professional duty and in 1832 returned to West Point as professor of military engineering, where he remained until his suicide, which was caused by temporary insanity. His text-books are generally recognized authorities and include: 'Treatise on Field Fortifications' (1836); 'Descriptive Geometry' (1864); 'Military Engineering' (1865); 'Permanent Fortifications' (1867); 'Military Course of Civil Engineering' (1837, rewritten 1868); etc.

Mahanadi, mā-hā-nūd'ī, or Mahanuddy, a river in British India. In the upper part of its course it drains the fertile plain of Chhattisgarh in the Central Provinces; flows southeast and then east through the province of Orissa, past Sambalpur and Cuttack, into the Bay of Bengal by two mouths, after a course of about 530 miles. During the rains it is navigable 300 miles from its estuary, but a large portion of its channel is dry during five or six months of the year. An extensive system of irrigation canals is connected with it. Diamonds are found in this river and in several of its tributaries.

Mahanoy (mā-ha-noi') City, Pa., borough, in Schuylkill County; on Mahanoy Creek, and on the Lehigh Valley and the Philadelphia & Reading R.R.'s; about 55 miles northeast of Harrisburg. The first settlement was made in 1859, and it was incorporated in 1863. It is in the anthracite region, and in the vicinity is fire-clay and an excellent building-stone. Its chief manufactures are pottery, foundry products, flour, hosiery, and lumber. In the vicinity are about 20 collieries, all of which are operated by residents of Mahanoy City. The trade is principally in coal, pottery, and lumber. The city has excellent public and parish schools and a number of fine churches. Pop. (1900) 13,504.

Maharajah, mā-hā-rā'ja, a title used in India; applied in courtesy to every rajah, or to any person of high rank or deemed holy.

Mahaseer, mā'ha-sēr, a large and ravenous barbel (*Barbus*) of India, which reaches six feet in length and in the early part of the rainy season afford the best sport known to the anglers of India and Ceylon, as they take a fly readily, and struggle with the gameness and energy of a salmon to get free, pleasantly taxing the skill of the angler to bring them to land without breaking rod and line. They spawn at the heads of the hill-rivers, and then descend before the young are hatched. The fry then have an opportunity to grow in comparative safety to a size which enables them, the following season, to descend the rivers and take care of themselves; otherwise they would be devoured in infancy by their elders.

Mahat'ma, a Hindu word meaning "the great-souled one" and applied among the Brahmans to one who has attained the highest possible point of spiritual enlightenment. It is also the name of a high priest or "wise leader" of the theosophists (q.v.).

Mahāyāna, a term applied to the "Northern School" of Buddhism which some centuries after the death of Buddha (q.v.) had spread and become the dominant system in northern India, including Kashmir and Nepal. Mahāyāna is a Sanskrit term meaning "Large Vehicle," so called because it is averred to be a system which

affords salvation to a larger number of persons than are reached by the "Southern School"—Hīnayāna, the "Little Vehicle." Mahāyāna corresponds with the Lamaism (q.v.) of Tibet and Mongolia. The Hinduistic and Shamanistic notions of the northern barbarians have been absorbed by it and the gods and rites that belong to Shīvaism (q.v.) have become adopted so as to alterate the purity of original Buddhism. A thousand new Buddhas appear in its doctrines, among whom is Adī-Buddha, who at Nepal assumed the prerogatives and demanded the worship belonging only to the Supreme Being. In certain Japanese sects so far as "The Great Vehicle" diverged from true Buddhism that priests are allowed to marry.

Mahdi, mā'dē. See MAD MULLAH.

Mahé, mā-hā', Indian Ocean, the largest island of the Seychelles Archipelago, belonging to Great Britain. It is 17 miles long by 4 miles broad, has an area of 55½ square miles, and attains an elevation of 2,000 feet above sea-level, from which it rises in most places nearly perpendicularly. It contains Victoria, the administrative seat, and a coaling station with a good harbor. See SEYCHELLES.

Mahhol. See MACHOL.

Mahi Kantha (mā'hē kân'tha) Agency, India, a group of 39 native Gujerat states, administered since 1820 by a British political agent of the province of Bombay. The chief state Idar, occupies about one half of the combined area of 9,300 square miles. Pop. (1900) 361,508, consisting largely of wild Bhil and Khoil tribesmen.

Mahican, mā-hik'an (meaning "wolf"), an Algonquin tribe of American Indians formerly occupying the Hudson River Valley. They were closely related to the Delawares and the Mohegans, the collective tribes being known as the *Loup* or Wolf Indians. At one time there was a settlement of 40 villages near the site of the present city of Albany. The assaults of the Iroquois and the white settlers diminished the tribe until the remnants of the race became merged with the Delawares. About 550 of the tribe still remain, located upon a reservation near Green Bay, Wis.

Mahmud (mā-mood') I., or Mohammed, Turkish sultan: b. Constantinople 1606; d. 1754. He was the son of Mustapha II. and succeeded his uncle Achmet III. He was a well-disposed but incapable monarch and his reign is of little importance.

Mahmud II., Turkish sultan: b. 20 July 1785; d. 1 July 1839. He was the second son of Abd-ul Hamid II., and under the reign of his uncle Selim III. he received an education exceptionally broad for a prince of his station. He succeeded his brother Mustapha in 1808 and organized his government on a reform basis. He conducted a war against Russia and Servia until 1812, subjected the Wahabees and quelled the insurrection of Ali Pasha in 1822. In his war with the Greeks he incurred the intervention of the powers with disastrous results to his forces. Mahmud was a progressive monarch, he introduced modern ideas of warfare, a regular police system, and founded schools. Against serious obstacles he crushed the janissaries, but a second rebellion of Mehemet Ali

in 1839 was followed by a defeat which shortly preceded the broad-minded monarch's death.

Mahmud, sultan of Ghazni, the founder of the Mohammedan empire in India: b. Ghazni about 970; d. 29 April 1030. His father Sabaktagin, governor of Ghazni, owed a nominal allegiance to Persia, but was really independent. On his death Mahmud put aside his brother Ishmael, whom his father had appointed to succeed him, took the title of sultan, then overthrew the Persian monarchy, and laid the foundation of an extensive empire in Central Asia. He then turned his attention to India, which he invaded repeatedly. His earlier expeditions into the country were directed against successive rajahs of Lahore, on whom he inflicted repeated defeats. In 1008 the rajah of Lahore, Anangpal, with the assistance of a powerful coalition of rajahs, had assembled one of the largest armies yet seen in the Panjab, but Mahmud was again victorious, and carried away enormous spoils from the Temple of Nagarcot (1008). On his return he celebrated a triumph at Ghazni. In 1010, after subduing Ghor in the Hindu-Kush, he resumed his conquests in India, captured Multan, plundered the Temple of Tanesar, and continued for a series of years to extend his conquests in successive expeditions. These for a time were interrupted by his conquest of Transoxiana, effected in 1016. In 1017 he set out at the head of an army of 100,000 foot and 20,000 horse, passed the Jamma Jummd, and turning to the south appeared before Canoj, the largest and most magnificent Indian city of the day, the rajah of which took precedence of all the Indian rajahs. As the rajah of Canoj at once submitted it was spared from pillage, a fate to which Mattra, a famous religious city, was subjected without restraint for twenty days. In 1023 he annexed the territories of Jeipal II., who had revolted, and established for the first time a permanent Mohammedan garrison in Lahore. His last, which is usually called his 12th, expedition into India (1024-6) was directed against Gujerat. He took the capital and changed the government, but the chief attraction was Somnāth. The magnificence of its temple filled him with wonder, and the descriptions of it suggest images of the palace of Aladdin. Its lofty roof was supported by 56 pillars carved and glittering with precious stones. It was lighted by a lamp suspended from the centre by a gold chain. A huge idol, which Mahmud broke, was found hollow, and disclosed immense treasures in diamonds and precious stones. The pieces of the idol were sent to Mecca, Medina, and Ghazni. The remainder of his enterprises were confined to western Asia. Mahmud was avaricious, and loved to accumulate treasures from his warlike expeditions.

Mahogany. A popular name for the timber of several unrelated trees, among which are various species of eucalyptus (q.v.), natives of Australia and members of the natural order *Myrtaceae*; two species of *Cercocarpus*, of the order *Rosaceae*, *C. parvifolius* being known as valley mahogany and *C. leidiifolius* as mountain mahogany in the Rocky Mountain region where they are native and are mainly used for fuel. African mahogany (*Kaya senegalensis*), East Indian mahogany (*Soyimida febrifuga*) and *Cedrela toona*, an East Indian tree equally well known also as the toona, all belong to the

natural order *Neliacea*, but are less important timber trees than the true mahogany (*Swietenia mahagoni*) of the same natural order. This species is a native of tropical America, occasional small specimens being found in extreme southern Florida. It was formerly abundant in the West Indies, reaching altitudes of 1,500 feet or more in Jamaica, but on account of the demand it is now scarce. Cuba and San Domingo formerly supplied the choicest; Honduras the low grades; now, practically all comes from Central America. The wood is generally some shade of brown, fine grained, easily polished and durable except under lateral strain. It is highly valued for furniture, musical instruments, interior house-finishings, etc., and is one of the most popular woods of the world: Formerly it was used for ship-building but now very little. The tree, which sometimes attains heights exceeding 100 feet, and diameters of six feet, has abruptly pinnate leaves with usually four pairs of leaflets, and small white or yellowish flowers in axillary or nearly terminal panicles. As an ornamental tree it is planted in southern Florida and southern California in rich soil. A few other related species of this genus are occasionally found in commerce.

Mahom'et. See MOHAMMED.

Mahon, mā-hōn', or **Port Mahon** (ancient *Portus Magonis*), Spain, city and port; on the island of Minorca, of which it is the capital, at the head of a bay which forms one of the best harbors on the Mediterranean. Fishing, fish-curing, agriculture, and stock raising are the chief occupations. In the bay are several rocky islets, on one of which stands an arsenal, on a second a lazaretto, and on a third a naval hospital. The harbor is strongly fortified. The exports are brandy, wine, dried fruits, agricultural produce, etc.; and the imports, grain, wearing apparel, tobacco, sugar, coffee, cacao, leather, hats, and other manufactured goods. Its trade amounts to about \$1,000,000 annually. Mahon was occupied by the English in 1708. It was taken from them, after a memorable siege, by the French under Marshal Richelieu on 28 June 1756. Admiral Byng was shot for failing to relieve it. It was restored to the English in 1763; and taken by the Spaniards in 1782. It was retaken in 1798, and finally given up to the French by the Treaty of Amiens in 1802. Pop. (1901) 18,123.

Mahone, mā-hōn', William, American soldier and politician: b. in Southampton County, Va., 1 Dec. 1826; d. Washington, D. C., 8 Oct. 1895. He was graduated at the Virginia Military Institute in 1847, and became a civil engineer and railroad constructor. At the opening of the Civil War he entered the Confederate army; took part in the Peninsular and Rappahannock campaigns, and by bravery at Petersburg acquired the sobriquet "The Hero of the Crater." (See PETERSBURG, OPERATIONS AROUND.) In 1864 he was made brigadier-general and major-general. The war over, he accepted the presidency of the Norfolk & Tennessee Railroad, and also became active in politics. He was the principal organizer (about 1878) and leader of the Readjusters (q.v.), chiefly a faction of the Democratic party in Virginia who favored the forcible readjustment of the State debt on terms involving conditional or partial repudiation. Mainly by the supporters

of this movement, he was elected in 1880 to the United States Senate, where, however, he acted with the Republicans, making the vote of the Senate a tie and disappointing the Democrats of their expected majority. By this and other acts of his senatorial career he lost favor with his constituents and was not re-elected.

Mahony, mäh'ō-ni, Francis Sylvester, "Father Prout," Irish author: b. Cork 1804; d. Paris 1866. Educated at a Jesuit seminary at Amiens, he studied theology at Paris, was admitted into the Order of the Jesuits and taught for some time in a Jesuit college in Ireland, but for some irregularities was deprived of the position of a member of the order. He received clerical ordination and officiated for a short time at Cork and in London, but soon adopted the profession of literature. In 1834-6 he contributed the 'Prout Papers' to 'Fraser's Magazine,' published as the 'Reliques of Father Prout' in 1836. In 1846 he became Roman correspondent to the *Daily News*, his letters being afterward republished as 'Facts and Figures from Italy' (1847). In his later years he was Paris correspondent for the *Globe*. The 'Reliques of Father Prout' in a revised and enlarged form were published in 1860, and 'Final Reliques' in 1876. In 1881 Charles Kent published a collective edition with a memoir. He will be longest remembered by his poem 'The Bells of Shandon.'

Mahrattas, mā-rāt'az, a native Hindu race, supposed to be descendants of the Persians, and occupying a large tract of central and western India. They came into prominence about the middle of the 17th century, when the chief Sevaji extended his conquests in various directions, had himself crowned king in 1674, and established the Mahratta empire. After his death long minorities and the incompetency of the sovereigns caused the powers of the state to fall into the hands of the *Peishwa* or prime minister, who became the acknowledged head of a Mahratta confederacy. This confederacy held together till 1795, but subsequent wars and disturbances reduced the *Peishwa* to the position of a British dependent, and Scindia, Holkar, and the rajah of Berar were able to take the position of independent sovereigns. The confederacy came to a final end in 1818, and Scindia, Holkar, the Guicowar of Baroda, and the rajah of Kolapore became dependent princes under British protection. Though devout worshippers of Brahma, no distinction of caste exists among them.

Mai, Angelo, ān'jā-lō mā'ē or **mī,** CARDINAL, Italian classical scholar: b. Schilpario, near Bergamo, Italy, 7 March 1782; d. Albano, 8 Sept. 1854. His abilities attracted the notice of Father Mozzi, a Jesuit, who instructed him in Latin, Greek and mathematics. On the establishment of a Jesuit college at Colorno, in the duchy of Parma, he accompanied Father Mozzi thither in 1799, and a few years afterward was made professor of Latin and Greek in the Jesuit college at Naples. He was transferred to Milan (1808), where he became an associate of the Ambrosian College, and one of the Curators of the Ambrosian Library. One special department to which he devoted himself was the examination of the palimpsests (q.v.) and through his industry in deciphering these, two volumes of fragments of Cicero's orations, of Lysimachus

and of *Isæus*, a fragment of the 'Vidularia' (a lost comedy of Plautus), and a collection of the letters and other writings of Cornelius Fronto, the preceptor of Marcus Aurelius, were recovered and given to the world. In 1819 he was appointed chief keeper of the Vatican Library at Rome, and discovered beneath a manuscript of St. Augustine's 'Enarrationes in Psalmos' obliterated fragments of Cicero's treatise 'De Republica,' amounting to about a fourth of the original, which he published in 1822 with a critical commentary. A colossal work was then undertaken by Mai, the editing of the various unpublished manuscripts in the Vatican, sacred and profane. It comprises ten quarto volumes, under the title of 'Scriptorum Veterum Nova Collectio e Vaticanis Codicibus edita' (1828-38), and consists of numerous fragments, previously believed to be lost, of the ancient historians, such as Polybius, Diodorus Siculus, Dionysius of Halicarnassus, Dion Cassius, Appian, and others, besides the various writings of the fathers. In 1838 he was created a cardinal. A new collection, 'Spicilegium Romanum,' was published in ten volumes between 1839 and 1844, and a patristic series, called 'Nova Patrum Bibliotheca,' issued between 1845 and 1853, closed his list of publications.

Maia, mā'ya, in Greek mythology, the eldest daughter of Atlas and Pleione. She was placed with her six sisters among the stars, where they have the common name of *Pleiades*. The Romans also worshipped a Maia, who was also called *Majesta*, and was afterward identified with the daughter of Atlas. The Tuscans called their principal deity *Majus*. The month of May is said to have received its name from them.

Maid of Athens, immortalized by Lord Byron, was Theresa Macri, who 25 years after Byron's poem was written had lost her beauty, lived in a hovel in dire poverty and had reared a large family.

Maid Marian, a name given Matilda, daughter of Fitz-Walter, baron of Bayard and Dunmow. She eloped with Robert Fitz-Ooth, an outlaw, and lived with him in Sherwood Forest. It is supposed that she was married by Friar Tuck to Fitz-Ooth, who was more commonly called Robin Hood.

Maid of the Mist, (1) the name of a small steamboat formerly used on the Niagara River below the Falls, to carry passengers close to the cataract. (2) A name given to the heroine of Sir Walter Scott's 'Anne of Geierstein.'

Maid of Orleans, a name given Jeanne d'Arc (1412-31) (q.v.).

Maiden, or **The Widow**, an instrument of capital punishment used in Scotland during the 16th century, the prototype of the French guillotine (q.v.): It consisted of an upright frame and a broad piece of iron a foot or more wide, sharp on the lower part, and loaded above with lead. At the time of execution this was pulled up to the top of the frame, in which was a groove on each side for it to slide in. The prisoner's neck being fastened to a bar underneath, on a sign given the cutting iron was let loose, and the head instantly severed from the body.

Maiden Queen, in England, a popular title bestowed upon Queen Elizabeth.

Maidenhair Fern. See **FERNS** AND **FERN** ALLIES.

Maid'stone (Saxon MEDWEGESTUN) England, municipal and parliamentary borough and the county town of Kent; 32 miles south-south-east from London; on the banks of the Medway. The town consists chiefly of four principal streets, which cross each other at the market-place, with smaller ones branching off at right angles. It has a fine old church and one of the largest parish buildings in the kingdom, supposed to be of the 14th century. It has excellent educational institutions; schools, libraries, science and art institutions, museums, play grounds, and parks. The chief industries are paper-making (for which there are several large mills) and brewing. An extensive trade is carried on in fruit and hops. The Medway is navigable for 15 miles above the town. Pop. (1901), 33,516. Consult: Cave-Browne, 'Maidstone'; Russell, 'History of Maidstone.'

Maidu People, an aboriginal Pujunan group of Indians of northern California, of which the chief tribe, the Concow, inhabited the region of the Upper Sacramento River. Their descendants are to be found in the Round Valley Reservation. Their communities comprised rough dwelling-places or hogáns built of boards, large circular halls or town-houses for assemblies and ceremonials, and wicker store-houses for the winter supply of acorns which with pignons formed their staple food supplies. Their clothing was of the scantiest description; the chief of their numerous dances was the acorn dance; and they had a secret male society in which the initiatory age was twelve.

Maignan, Albert, ál-bâr nây-ân, French painter: b. Beaumont, Sarthe, 15 Dec. 1844. He studied at Paris under Noël and developed a strong and original manner in historical and landscape painting. At the Salon of 1879 he was awarded a first class medal. Amongst the most striking of his pictures are 'Dante's Meeting with the Countess Matilda' (1881) now in the Luxembourg; and 'Assault on Pope Boniface VIII. at Anagni' in the New York Metropolitan Museum of Art.

Maigre, mǎ'gér, or **Meagre**, a large European drum-fish (*Sciæna aquila*), common in the Mediterranean, where it forms one of the most important local food-fishes. It may attain a length of six feet, and its flesh has always been a favorite with epicures. Yarrell says that anciently on account of its large size it was always sold in pieces, and that the fishermen of Rome were accustomed to present the head, considered the finest part, as a sort of tribute to the three local magistrates who acted for the time as the conservators of the city.

Mail-shell. See **CHITON**.

Maldun, mǎl'doon, hero of Irish romance. He was the son of Allil Ocar Aga, of the tribe of Owenaught of Ninus, in County Clare, and before his birth his father was killed by pirates. He grew up handsome and accomplished, but had scarce reached manhood before he set sail with a crew of 60 men to find his father's murderer. For three years and seven months he voyaged on the Western Ocean seeing marvels such as no eyes had seen before. At length he found the murderer of his father, but pardoned him his wrong in gratitude to the great mercy

of God who had delivered him from so many perils. See Tennyson, 'The Voyage of Mael-dune.'

Maimon, mī'mōn, **Solomon**, German philosopher: b. near Mir in Minsk, 1754; d. Siegersdorf, Lower Silesia, 22 Nov. 1800. He was trained for a rabbi, but having become acquainted with the philosophy of Maimonides, he made his way to Berlin, and studied modern philosophy, languages, and some science. Besides cultivating his own mind, and teaching a little, he wrote some philosophical treatises and literary hack-work. Yet he had Mendelssohn, the philosopher, among his friends, was admired by Kant, and attracted the attention of Goethe. This he owed to his 'Attempt at a Philosophy of Transcendentalism' (1790), in which he set out to supplement Kant's system with truths gleaned for the most part from Spinoza, Leibnitz, Hume, Locke, and others.

Maimonides, mī-mōn'ī-dēz, properly MOSES BEN MAIMON BEN JOSEPH (Arabic, Abu Amram Musa ibn Maimun Obeid Allah al-Korlobi), Jewish scholar: b. Cordova, Spain, 30 March 1135; d. 13 Dec. 1204. At an early period he developed a taste for the exact sciences and for philosophy. He read with zeal not only the works of the Mohammedan scholastics, but also those of the Greek philosophers in such dress as they had been made accessible by their Arabian translators. In this way his mind, which by nature ran in logical and systematic grooves, was strengthened in its bent; and he acquired that distaste for mysticism and vagueness so characteristic of his literary labors. He went so far as to abhor poetry, the best of which he declared to be false, since it was founded upon pure invention—and this too in a land which had produced such noble expressions of the Hebrew and Arab muse. It is strange that this man, whose character was that of a sage, and who was revered for his person as well as for his books, should have led such an unquiet life, and have written his works so full of erudition with the staff of the wanderer in his land. For his peaceful studies were rudely disturbed in his 13th year by the invasion of the Almohades, or Mohammedan Unitarians, from Africa. They not only captured Cordova, but set up a form of religious persecution which happily is not always characteristic of Islamic piety. Maimonides' father wandered to Almeria on the coast; and then (1159) straight into the lion's jaws at Fez in Africa,—a line of conduct hardly intelligible in one who had fled for the better exercise of the dictates of conscience. So pressing did the importunities of the Almohad fanatics become, that together with his family Maimonides was compelled to don the turban, and to live for several years the life of an Arabic Marrano. This blot upon his fair fame—if blot it be—he tried to excuse in two treatises, which may be looked upon as his 'Apologia pro vita sua': one on the subject of conversion in general (1160), and another addressed to his coreligionists in southern Arabia on the coming of the Messiah. But the position was untenable and in 1165 we find Maimonides again on the road, reaching Accho, Jerusalem, Hebron, and finally Egypt. Under the milder rule of the Ayyubite caliphs, no suppression of his belief was necessary. Maimonides settled with his brother in old Cairo or Fostat; gaining his daily

pittance, first as a jeweler, and then in the practice of medicine; the while he continued in the study of philosophy and the elaboration of the great works upon which his fame reposes. In 1177 he was recognized as the head of the Jewish community of Egypt, and soon afterward was placed upon the list of court physicians to Saladin. When he died, his body was taken to Tiberias for burial.

Perhaps no fairer presentation of the principles and practices of rabbinical Judaism can be cited than that contained in the three chief works of Maimonides. His clear-cut mind gathered the various threads which Jewish theology and life had spun since the closing of the Biblical canon, and wove them into such a fabric that a new period may fitly be said to have been ushered in. The Mishnah had become the law-book of the Diaspora; in it was to be found the system of ordinances and practices which had been developed up to the 2d century A.D. In the scholastic discussions in which the Jewish schoolmen had indulged their wit and their ingenuity, much of its plain meaning had become obscured. At 23 Maimonides commenced to work upon a commentary to this Mishnah, which took him seven years to complete. It was written in Arabic, and very fitly called 'The Illumination'; for here the philosophic training of its author was brought to bear upon the dry legal mass, and to give it life as well as light. The induction of philosophy into law is seen to even more peculiar advantage in his 'Mishnah Tōrah' (Repeated Law). The scholastic discussions upon the Mishnah had in the 6th century been put into writing, and had become that vast medley of thought, that kaleidoscope of schoolroom life, known by the name of Talmud. Based upon the slender framework of the Mishnah, the vast edifice had been built up with so little plan and symmetry that its various ramifications could only be followed with the greatest difficulty and with infinite exertion. In turn, the Talmud had supplanted the Mishnah as the rule of life and the directive of religious observance. Even before the time of Maimonides, scholars had tried their hand at putting order into this great chaos; but none of their efforts had proved satisfactory. For ten years Maimonides worked and produced this digest, in which he arranged in scientific order all the material which a Jewish jurist and theologian might be called upon to use. Though this digest was received with delight by the Jews of Spain, many were found who looked upon Maimonides' work as an attempt to crystallize into unchangeable law the fluctuating streams of tradition. The same objection was made to his attempt to formulate into a creed the purely theological ideas of the Judaism of his day. His 'Thirteen Articles' brought on a war of strong opposition; and though in the end, the fame of their author conquered a place for them even in the Synagogue Ritual, they were never accepted by the entire Jewry. They remained the presentation of an individual scholar.

But his chief philosophical work, his 'Guide of the Perplexed' (Dalālat al-Hāirin), carried him still further; and for centuries fairly divided the Jewish camp into two parties. The battle between the Maimonists and anti-Maimonists waged fiercely in Spain and Provence.

In the 'Guide of the Perplexed' Maimonides

has also produced a work which was "epoch-making" in Jewish philosophy. It is the best attempt ever made by a Jew to combine philosophy with theology. Aristotle was known to Maimonides through Al-Farabi and Ibn Sinā (Avicenna); and he is convinced that the Stagyrite is to be followed in certain things, as he is that the Bible must be followed in others. In fact, there can be no divergence between the two; for both have the same end in view,—to prove the existence of God. The aim of metaphysics is to perfect man intellectually; the same aim is at the core of Talmudic Judaism. Reason and revelation must speak the same language; and by a peculiar kind of subtle exegesis—which provoked much opposition, as it seemed to do violence to the plain wording—he is able to find his philosophical ideas in the text of the Bible. But he is careful to limit his acquiescence in Aristotle's teaching to things which occur below the sphere of the moon. He was afraid of coming into contact with the foundations of religious belief, and of having to deny the existence of wonders. The Bible teaches that matter was created, and the arguments advanced in favor of both the Platonic and Aristotelian views he looks upon as insufficient. The Jewish belief that God brought into existence not only the form but also the matter of the world, Maimonides looks upon much as an article of faith. The same is true of the belief in a resurrection. He adduces so little proof for this dogma that the people of his day were ready to charge him with heresy.

Maimonides is able to present 25 ontological arguments for his belief in the existence, unity, and incorporeality of God. What strikes one most is the almost colorless conception of the Deity at which he arrives. In his endeavor to remove the slightest shadow of corporeality in this conception, he is finally led to deny that any positive attributes can be posited of God. Such attributes would only be "accidentia"; and any such "accidentia" would limit the idea of oneness. Even attributes which would merely show the relation of the Divine Being to other beings are excluded; because he is so far removed from things non-Divine, as to make all comparison impossible. Even existence, when spoken of in regard to him, is not an attribute. In his school language, the "essentia" of God involves his "existentia." We have therefore to rely entirely upon negative attributes in trying to get a clear concept of the Deity.

If the Deity is so far removed, how then is he to act upon the world? Maimonides supposes that this medium is to be found in the world of the spheres. Of these spheres there are nine: "the all-encompassing sphere, that of the fixed stars, and those of the seven planets." Each sphere is presided over by an intelligence which is its motive power. These intelligences are called angels in the Bible. The highest intelligence is immaterial. It is the *noûs poiētikós*, the ever-active intellect. It is the power which gives form to all things, and makes that which was potential really existent. "Prophecy is an emanation sent forth by the Divine Being through the medium of the active intellect, in the first instance to man's rational faculty and then to his imaginative faculty. The lower grade of prophecy comes by means of dreams, the higher through visions accorded the prophet

in a waking condition. The symbolical actions of the prophets are nothing more than states of the soul." High above all the prophets Maimonides places Moses, to whom he attributes a special power, by means of which the active intellect worked upon him without the mediation of the imagination. The psychological parts of the 'Guide' present in a Jewish garb the Peripatetic philosophy as expounded by Alexander of Aphrodisia. Reason exists in the powers of the soul, but only potentially as latent reason (*noûs hálikos*). It has the power to assimilate immaterial forms which come from the active reason. It thus becomes acquired or developed reason (*noûs epiktētos*); and by still further assimilation it becomes gradually an entity separable from the body, so that at death it can live on unattached to the body. In ethics Maimonides is a strong partisan of the doctrine of the freedom of the will. No one moves him, no one drives him to certain actions. He can choose, according to his own inner vision, the way on which he wishes to walk. Nor does this doctrine involve any limitation of the Divine power, as this freedom is fully predetermined by the Deity. But Maimonides must have felt the difficulty of squaring the doctrine of the freedom of the will with that of the omniscience of God; for he intrenches himself behind the statement that the knowledge of God is so far removed from human knowledge as to make all comparison impossible. Again, in true Aristotelian style, Maimonides holds that those actions are to be considered virtuous which follow the golden mean between the extremes of too much and too little. The really wise man will always choose this road; and such wisdom can be learned; by continued practice it can become part of man's nature. He is most truly virtuous who has reached this eminence, and who has eliminated from his own being even the desire to do wrong.

The daring with which Maimonides treated many portions of Jewish theology did not fail to show its effect immediately after the publication of the 'Guide.' His rationalistic notions about revelation, his allegorizing interpretation of Scripture, his apparent want of complete faith in the doctrine of resurrection, produced among the Jews a violent reaction against all philosophical inquiry, which lasted down to the times of the French Revolution. Even non-Jews looked askance at his system. In Montpellier and in Paris, his own Jewish opponents, not content with having gotten an edict against the use of the master's writings, obtained the aid of the Church (for the 'Guide' had been translated into Latin in the 13th century), and had it publicly consigned to the flames. But all this was only further evidence of the power which Maimonides wielded. The Karaites copied it; the Kabbalah even tried to claim it as its own. Many who were not of the House of Israel, as Thomas Aquinas and Albertus Magnus, acknowledged the debt they owed the Spanish rabbi; and Spinoza, though in many places an opponent, shows clearly how carefully he had studied the 'Guide of the Perplexed.' Consult Yellin and Abrahams, 'Maimonides,' and the authorities there mentioned.

GUSTAV GOTTHEIL.

Main, mān, Hubert Platt, American composer and editor: b. Ridgefield, Conn., 17 Aug. 1839. He was educated in the public schools

and for 45 years has been editor of song collections and other publications for church use, besides composing many hymns. He has also published 'A Dictionary of American Musicians and Poets.'

Main, *mān* (Ger. *min*), or **Mayn**, a river of Germany, which has its source in the north-eastern part of Bavaria, about 13 miles north-west of Baireuth. It flows northwest to the border of Bavaria, and then makes a succession of remarkable zigzags, continuing, however, in a westerly direction, till it reaches the border of the grand-duchy of Hesse, which it enters. It then flows circuitously west, partly forming the boundary between Hesse and the Prussian province of Hesse-Nassau, and joins the Rhine a little above the town of Mainz, after a course of over 300 miles. The principal cities which it passes are Würzburg, Aschaffenburg, and Frankfort. It is navigable for about 200 miles, and by improvements the largest Rhine steamers can ascend to Frankfort. By means of King Ludwig's Canal it affords through navigation to the Danube.

Maine, *mān*, **Sir Henry James Sumner**, English jurist: b. Caverham Grove, Oxfordshire, England, 15 Aug. 1822; d. Cannes, France, 3 Feb. 1888. He was educated at Cambridge, where he was professor of Civil Law 1847-52. In 1852 he became reader on Roman law at the Inns of Court, London, and ten years later went to India where he was legal member of the council 1862-9. On his return, in 1869, he was appointed professor of jurisprudence at Oxford, 1869-78, and held this post till 1878. He was master of Trinity Hall, Cambridge, 1877, and professor of international law at Cambridge, 1887-88. Among his more noted works were: 'Roman Law and Legal Education' (1856); 'Ancient Law' (1861), an epoch-making book; 'Village Communities' (1871); 'Popular Government' (1855). Consult: Duff, 'Sir Henry Maine: a Brief Memoir of his Life' (1892).

Maine de Biran, **François Pierre Gonthier**, *frān-swā pē-ār gōn-tē-ā mān dē bē-rōn*, French philosopher: b. Bergerac (Dordogne) 29 Nov. 1766; d. Paris 16 July 1824. He entered the Life Guards of Louis XVI. in 1784, was present at Versailles on 5-6 Oct. 1789, but was not concerned in the Revolution. He opposed Napoleon in the latter part of his reign, and became a legitimist at the restoration. His chief philosophical essays are: 'Influence de l'Habitude' (1803); 'Sur la Décomposition de la Pensée' (1805); 'Sur l'Apperception Immédiate' (1807); and 'Rapports du Physique et du Moral' (1811). Maine de Biran's importance as a philosopher is chiefly due to his giving the direction to philosophic speculation afterward developed in the school founded by Victor Cousin.

Maine (name given as early as 1622 to distinguish the *mainland* from the islands. It was called in the Mason and Gorges Patent, "the Mayn Land of New England," and in the great charter, "Province of Maine"), one of the New England group of North Atlantic States and the most easterly State of the Union. It is between lat. 43° 6' and 47° 27' 33" N. and lon. 66° 56' 48" and 71° 6' 41" W. The 45th parallel crosses the State within 30 miles of its

geographical centre. This position, almost precisely equidistant between the equator and the pole influences the water-power of the State in an important degree, and chiefly through its meteorological conditions. It is bounded on the north by Quebec and New Brunswick, provinces of Canada, on the east by New Brunswick and the Atlantic Ocean, on the south by the Atlantic, and on the west by the State of New Hampshire and the Province of Quebec. Its greatest extent is from north to south; its greatest length about 303 miles and its greatest width about 212 miles; area 31,500 square miles, of which 3,000 square miles are water surface. Maine is within 385 square miles of being as large as all the rest of the New England group, and is the 35th in size among the States of the Union.

Topography.—The northeastern and southwestern boundaries are straight lines except a portion of the extreme southwestern boundary. The northern, northwestern, and southeastern boundaries are irregular. The coast line is fringed by islands and indented by numerous bays, and in length, measured from Eastport to the southernmost extremity in a direct line, is about 226 miles; but Maine has really about 2,500 miles of sea coast. The coast from the eastern extremity to Penobscot Bay is high and rugged. The greater part of the coast of York County, in the southwest, is low.

There are two general mountain slopes in Maine, the highest part extending across the State from north of the source of the Megalloway River in the west, northeast to Mars Hill. South of the main divide is Mount Katahdin, 5,385 feet in height; Mount Abraham in the west, in Franklin County, is 3,387 feet high; Saddleback Mountain, 4,000 feet, and Mount Blue, 3,900 feet, are in the same county. Green Mountain on Mount Desert Island is 1,800 feet high, and is one of numerous peaks more or less conical in form, isolated or in clusters, comparatively bare of soil, and densely wooded about their bases. There is no long range of mountains in the State.

Hydrography.—That portion of the State north of the main divide is drained almost wholly by the Saint John River and its tributaries, and the part south of the main divide is drained chiefly by the Androscoggin, Kennebec, Penobscot, and Saint Croix rivers. The basin of Saint John River has an area of about 7,425 square miles. The head-waters of this river are in the northwestern part of Maine and the eastern part of Quebec, and it flows north by east for some distance past Saint Francis on the north to the extreme northeastern boundary, where it makes a turn and flows generally southeast through New Brunswick to the Bay of Fundy. The largest Maine tributaries of the Saint John are the Aroostook and the Allegash. The waters of a large number of the lakes of Maine find their outlet through the Saint John. The rivers south of the main divide flow generally south to the ocean. The source of the Kennebec is about 2,000 feet above the sea, of the Penobscot over 2,300 feet, of the Androscoggin about 3,000 feet, of the Saco in the southwest nearly 2,000 feet. They, together with their tributaries, are swiftly flowing streams, in many places passing over rocky beds which form rapids and falls and furnish extensive water-powers. The available water-power of the State has been

estimated at nearly 3,000,00 horse-power. The flow of the tide is so great on the coast that it has been estimated "That with suitable wheels it can be operated sixteen hours out of the twenty-four." There are about 1,580 lakes in Maine, a large number of which are near the sources of the rivers. The surface of the lakes and rivers constitutes nearly one tenth of the whole area of the State. Moosehead Lake is the largest in the State. (For description of rivers, see separate articles.)

Geology.—The nature of the geological formation of Maine shows that it belongs to one of the oldest parts of the United States. The marks of the Glacial period may be plainly traced in several parts of the State; the changes in extent and form of the river beds and lakes are shown by the rock formation of the vicinity and the nature of the deposits which were brought from the mountains to the valleys. The northern portion of the State belongs to the Devonian period and the region about Penobscot Bay to the Silurian. In the southern part of the State are fossiliferous clays. There are a number of low ridges which evidently were once portions of mountain ranges, but which usually formed angles with the two great ranges that at one time extended across the State. Granite, slate, and marble exist in large quantities.

Soil.—The soil of the State shows the effects of the Glacial period as much as the rocks; the greater part of the surface is till and various forms of glacial debris. The old lake bottoms, now dry land, are largely alluvial and in these places the soil is very fertile. In such localities there are extensive agricultural lands.

Minerals and Mining.—Granite is one of the most important wealth producing minerals of the State. Along the coast and inland for some distance there are large areas of granite outcrop. It is found in such quantities near tide water that quarrying and shipping are comparatively easy and inexpensive. The feldspar and quartz are easily separated. Hallowell, Dix Island, Vinal Haven, and Freeport furnish the largest quantity. The Capitol at Albany, N. Y., and the Metropolitan Museum of Art, New York city, are built of granite from Hallowell. Crystalline limestone and marble are found in several places; in the southwestern part of the State the deposits are quite extensive. Slate of good quality is found in the central part of the State. It is quarried for table tops, blackboards, roofing and for mantels. The slate from Piscataquis County is remarkably pure, capable of being split into thin plates, and in color a deep blue-black. Silica and feldspar of an excellent quality are found in several places. Some of the products made in whole or in part from silica and feldspar are glass, porcelain, scouring soap, sandpaper, earthenware, and woodfiller. The silica is found in vein-quartz in some of the crystalline rocks. Tourmalin is found in Oxford County in large and beautiful crystals. Some of the other minerals are iron, copper, zinc, arsenic, manganese, tin, silver, gold, antimony, pyrites, and beryl. The value of the mineral output for 1899 was: granite, \$1,321,182; limestone and marble, \$1,028,375; slate, \$181,766; silica, \$50,336; other mineral products, \$60,126, making the total amount for quarry purposes for 1899, \$2,641,785. Maine ranks sec-

ond among the States in the output of granite; fourth in the output of slate and sixth in the output of limestone and marble.

There are in the State nearly 30 mineral springs which are known and used; 10 of them are in Androscoggin County. In 1899 the State reported of 26 springs an output of 1,850,132 gallons for \$179,450.

Climate.—The climate is cold a considerable part of the year; snow covers the ground from three to five months. The summers are short; in the southern part of the State there is not more, usually less, than five months for the maturing of crops. The extensive forests have been a protection, and with the good river drainage and the sea breezes have tended to make the climate most healthful. The mean temperature in January is 15° F.; in May 52°; in July 68°; in October 51°; in December 22°. The average temperature in the whole State is in summer 62.5° F. and in winter 20° F.

Flora.—The trees and plants common to the northeastern part of the United States flourish here. In the southern part are fine grasses, hardy fruits, and a varied shrubbery. The strawberry, blackberry, raspberry, blueberry, thorn-apple, and gooseberry grow in all parts of the State. (See *Forests and Agriculture*.)

Fauna.—Maine has a large number and variety of animals, among which are deer, moose, fox, beaver, sable, marten, mink, weasel, squirrel, rabbit, porcupine, and wildcat. Wild geese, ducks and teal are found in the vicinity of the lakes; fish-hawks and gulls on the coast; plovers, orioles, bobolinks and all the birds of other parts of New England are common. The lakes and rivers are filled with fish, and the coast fisheries are most valuable. (See *Fisheries*.)

Forests.—Maine is known as the "Pine Tree State" because of the large extent of pine forests which once existed within its limits. The majestic "mast pine," which the State once furnished for many ships, has almost become a thing of the past, yielding to the demands of commerce. The greater part of the State is covered with forests; about 66 per cent of the land area in 1902 was woodland. The northern and central parts are forest; in the southern part along the coast and along the navigable streams the land is cleared and cultivated. Trees grow rapidly. Denuded tracts, unless cultivated, will soon send up an undergrowth which become trees of fair size in the course of a few years. Actual deforestation, except from forest fires, can never take place to any considerable extent in Maine, as the agricultural lands are very largely occupied. Nearly all the lumber of Maine used in the manufacture of pulp and paper has been taken from the drainage of the Androscoggin, Kennebec and Penobscot rivers, in the following proportions: 42 per cent from the Androscoggin; 33 per cent from the Kennebec; and 35 per cent from the Penobscot. Practically there has been none taken from the Saint John's River or from the southeastern portion of the State in Washington and Hancock counties, both being large wild land regions. The total average of these three systems from which the whole pulp lumber consumed in the State has been taken is about 4,741,000 acres, leaving more than one half the entire wild land region from which no pulp wood of any consequence has ever been removed. There

MAINE

was estimated standing in 1892, 21,239,000,000 feet of spruce alone, besides an almost equal quantity of pine, cedar, hemlock, poplar and various species of hard wood. The annual growth is considered sufficient to warrant the cutting of 637,000,000 feet of spruce timber each year, without depleting the supply, and as the pulp mills now established consume only about 275,000,000 feet of spruce per year, this leaves for saw-mill purposes about 362,000,000, if the annual increase alone is cut. The Forest Commissioner states that it is safe to reckon that there will be from 11,000,000 to 12,000,000 acres of land in the State that will be lumber producing for all time. Upwards of 35,000,000 feet of white birch timber are taken annually from Maine forests. The white birch area is a wide belt extending entirely across the State. Though used for many purposes its greatest utilization is by spool factories which produce about 800,000,000 spools, valued at more than \$1,000,000. Besides being used in the production of spools a large quantity is shipped to Europe in spool bars. A variety of small articles are also manufactured from it, as baskets, furniture, office equipments, etc. The science of forestry is being employed extensively in the preservation of timber by private corporations.

Fisheries.—The rivers and lakes are well stocked with fish; the State is considered the sportsman's paradise. Some of the varieties are the speckled trout, sturgeon, pickerel, salmon, bass and bream. Lobsters, clams and mussels are in large quantities on the coast waters, and in the bays and inlets are bluefish, rock-cod, sculpins, cunners, flounders, and some others. In the off-shore waters there are cod, herring, mackerel, haddock, hake, porgy, menhaden, and pollock, which are caught in large quantities. One species of herring, the *Culpea harengus*, furnishes a large portion of the fish used in the sardine-canning establishments of Lubec, Eastport, and other places. The fisheries of Maine rank second in value among the fisheries of New England, but more men are engaged in this industry in Maine than in any other of the northeastern Atlantic States. The report of Commissioner of Sea and Shore Fisheries for 1902 gives the following statistics: persons employed, 16,784; fishermen, 10,126; shoresmen, 6,658; value of product, \$3,319,424.

In 1892 the lobster fisheries product was \$992,855, this amount being greater than for all lobsters in all the other New England States. The law passed in 1895, for the protection of the lobster fisheries greatly curtailed this branch of the fishing industry, as it prohibited the taking of lobsters less than 10½ inches in extreme length. This has caused the removal of canning establishments to Nova Scotia, N. B., and the Magdalen Islands. The government is at present planting large quantities of lobster fry along the coast. In 1901 15,000,000 and in 1902 37,100,000 were planted. Clam fishing ranks next in importance; canning clams is a prominent industry, also the preparation of smoked herring. Salmon fishing is largely in the Penobscot and Kennebec rivers. The fishery trade is centred chiefly at Portland, Rockland and Vinal Haven. The sardine fisheries are located in Washington, Hancock, Lincoln and Cumberland counties, and produced in 1902, \$1,009,205. The following tables show the number of

cases packed: 829,274 cases ¼ size, 353 cases ½ size in oil; 20,138 cases ¼ size, 337 cases ½ size, and 327,663 cases ¾ size in mustard; 1,156 cases ¾ size spiced and 247 cases ¼ size with tomatoes.

Agriculture and Stock Raising.—The soil of a considerable portion of the State is not adapted to agriculture, owing to the large acreage of forest land. But a little over 33 per cent is farm land and of that nearly one third is not improved. The most fertile lands are in the river valleys, the largest acreage being in the northeastern part of the State in the Aroostook basin. The farms average in size about 105 acres, and less than 5 per cent of the farms are occupied by tenants (Government Census Bulletin No. 139, 13 Feb. 1902). The owner living on the farm means more intensive methods of cultivation, a systematic enrichment of the soil, and a careful rotation of crops. The cereal crops, especially wheat, have decreased in extent owing to western competition, but in Aroostook County they are increasing. The Federal census of 1900 shows that in this county the cereals occupied one half the total of the cereal acreage of the State. The crop of oats, once large, has also decreased; yellow corn, formerly cultivated on all the farms, never occupied much area and is now raised principally for fodder. The finest sweet corn in the world is raised in Maine for canning, and goes to all parts of the country. There are about 50 canning establishments in the State.

Buckwheat, which produces excellent flour in a soil and climate like Maine, is still cultivated. The returns from the potato crop are greater than from all the cereals. Hay of an excellent quality is marketed at good prices. Farmers living near markets are giving considerable attention to market gardening and dairying. Fine grained vegetables, sweet corn, small fruits, and apples flourish and bring excellent returns. Apple orchards are increasing in number and increased attention is being given to their care and cultivation. The raising of horses is increasing, but the number of neat cattle, and sheep is decreasing. The number of milch cows is increasing. The statistics of 1900 show that nearly 30 per cent of the farms derived more income from dairy products than from all other sources. However such statistics are sometimes unreliable as a large part of the living of the farmer's family comes from the farm, but that only is reckoned as income which is sold from the farm. The amount received in 1900 for dairy products was about \$5,605,000. The Federal Census Reports of 1900 give the following statistics: 59,299 farms, covering 6,298,591 acres, of which 2,386,428 acres were unimproved. The total value of the farm property of the State was \$122,383,844. The value of the products for 1899 was \$37,104,375. For the year ending 1 June 1900 some of the farm products were as follows:

		Value.
Hay,	343,997 tons	\$10,929,761
Potatoes,	6,200,208 bushels	3,038,102
Oats,	5,257,612 bushels	1,997,398
Buckwheat,	719,760 bushels	352,682
Corn,	440,244 bushels	242,134
Barley,	315,319 bushels	195,498
Wheat,	40,755 bushels	36,680
Rye,	17,080 bushels	14,006

MAINE

In 1899 the farm animals were:

	Number.	Value.
Horses	109,747	\$6,432,826
Sheep	254,027	787,484
Milch cows	203,814	5,890,225
Other cattle	112,723	2,973,863

Manufactures.—The extensive water-power has been a great aid in developing manufacturing industries. Ship-building was among the first manufacturing industries of the State. The first vessel built in Maine was the Virginia. She was built by the Popham Colony 1607-8,

tered throughout the State. The oil cloth industry was first started in Maine in 1845 by C. M. Bailey of Winthrop (q.v.). Nearly all the factories are located near the coast, or in localities where abundant water-power and good transportation lessen the cost of production and shipping. Lime and cement are important manufacturing products; large quantities of lime are made in Knox County. The following comparative table from the Federal census for 1900 will give some idea of the value of the manufacturing industries.

INDUSTRIES.	Year	Number of establishments	Capital	Value of products including custom work and repairing
Total for selected industries for State..	1900 1890	1,689 1,580	\$86,564,100 56,706,127	\$73,368,312 54,631,124

and under command of Captain James Davis sailed from Plymouth with the Somers and Gates Colony for Jamestown, 1 June 1609. Bath was the chief ship-building centre of the United States for over 100 years, and is yet a ship-building centre of importance. Prior to the construction of steel vessels, the Maine forests supplied a large amount of the timber used in ocean vessels built in the United States and fully half the ocean vessels of the nation, up to 1900, were made in Maine. Bath builds now many steel vessels. The manufacture of leather is another of the leading industries. The bark of the hemlock is used in large quantities for tanning. The manufacturing of cotton and woolen goods began the latter part of the 18th century and has been continued. Lewiston is the chief centre of cotton manufacturing. There is a tendency now to remove the cotton manufacturing industry to the Southern States or nearer the supply of raw material. Biddeford and Saco are extensively engaged in manufacturing cotton goods. Woolen mills are scat-

Political Divisions.—Maine is divided into 16 counties, as follows: Androscoggin, Aroostook, Cumberland, Franklin, Hancock, Kennebec, Knox, Lincoln, Oxford, Penobscot, Piscataquis, Sagadahoc, Somerset, Waldo, Washington, York. Pop. (1890) 661,086; (1900) 694,466.

The principal cities of Maine are Portland, the metropolis, founded in 1632; Lewiston, Bangor, Bath, Augusta, Saco and Biddeford, each of which is treated in a separate article.

Banking Institutions.—There were in 1903 84 national banks doing business in this State, having capital stock \$10,141,000, surplus and profits \$5,391,696, circulation \$5,785,955, deposits \$27,975,672, United States bonds \$6,313,350, loans and discounts \$29,285,840, total resources \$50,224,268. Also 51 mutual savings banks with deposits of \$75,107,203, and total assets of \$80,538,169, belonging to 209,011 depositors; also, 23 trust and banking companies having capital stock \$2,022,000, surplus and profits \$1,460,826, deposits \$15,266,085, and total assets \$19,914,000; also, 35 loan and building associations holding

MAINE.

STATE CAPITOL AT AUGUSTA.

total assets of \$2,932,206, owned by 8,444 shareholders.

Total assets of above named institutions \$153,608,654.

The aggregate amount of exchanges at the local clearing-house in Portland for the year ending 31 Dec. 1903 was \$77,474,995, an increase of \$4,397,901 over those of the previous year.

Finances.—The property value in 1903 as determined by the Board of State Assessors was as follows: real estate, \$247,014,840; personal estate, \$69,962,904; total, \$316,977,834, an increase of \$8,481,339 over the previous year; tax rate, \$2.75 on \$1,000. State debt 1 Jan. 1904: bonded debt, \$1,913,000. Resources of the State were: cash on hand, \$637,678.

Government.—The State Constitution, under which the laws of the State are administered was adopted by the people in town meetings, held throughout the State, December 1819. To amend or change the Constitution it is necessary to have in favor a two-thirds vote of both Houses of the Legislature and a majority of the votes cast at the next biennial election or meeting of the people. A voter must be a citizen of the State; that is, no one has the right of suffrage but males, 21 years or over, citizens of the United States, who have resided in the State, county, town, and voting district three months. Men of 21 years and over who are excluded from voting are, paupers, Indians who are not taxed, and persons under guardianship. Voters who are soldiers in the State militia or regular United States army may vote when serving outside the State. An amendment was made to the Constitution in 1884 to prohibit the manufacture and sale of intoxicating liquors. Severe penalties were attached to the violation of the law. State, city and town officials supervise the sale of liquors, and permit such sales only for medicinal, manufacturing, and mechanical purposes.

Executive.—A plurality of the votes cast is necessary for the election of the Governor, who holds office for a term of two years. His council consists of seven members elected biennially on joint ballot of the Legislature, but any district prescribed for the election of senators can furnish only one councillor. The Governor and council have power to grant pardons, commutations, and reprieves, and to remit penalties. They also have the appointment of the judges of the Supreme Court. In case of vacancy in the office of governor, the President of the Senate and Speaker of the House are respectively in line of succession. The Secretary of State and the Treasurer are elected on joint ballot of the Legislature and for two years.

Legislature.—The Legislature is composed of a Senate and House of Representatives. There are (1903) 31 members of the Senate and 151 members of the House elected biennially on the second Monday in September. They meet in session on the first Wednesday in January next following their election. The Senators are elected from Senatorial districts into which the counties of the State are divided. The Representatives are elected from towns. All bills relating to revenues must originate in the House of Representatives. The House has power of impeachment; but the Senate conducts the trials of impeachments. The Legislature may overcome the Governor's veto by a two-thirds vote

each of House and Senate. The State has four Congressmen.

Judiciary.—The eight judges who compose the Supreme Judicial Court are appointed for a term of seven years by the Governor and Council. The judge of the Superior Court of Cumberland County, which includes the city of Portland, the judges of the inferior courts, of municipal and police courts, are also appointed by the State executive and his council. The term of appointment of the judges of the inferior courts is seven years, and of the judges of municipal and police courts, four years. Probate judges are chosen by the people by election and for a term of four years. The attorney-general is elected on joint ballot of the Legislature and for a term of two years.

Local Government.—There is a general law providing for the election and duties of State, county, town, and city officers, and penalties for non-fulfilment of their duties. The county officers are, trial justices, county attorney, county commissioners, bail commissioners, judges of probate, sheriff, deputy sheriffs, registers of deeds, treasurer, clerk, commissioners of disclosure, stenographic commissioners, and coroners. The town officers are, selectmen, clerk, treasurer, collector of taxes, constables, road commissioners, school committees, health officer. Justices of the peace have jurisdiction throughout the State.

Militia.—In 1903 the National Guard of the State numbered 1,156 infantry, with 122 commissioned officers. The number of the National Guard of the State may be 2,940, which if needed for active service may be increased to 100,000. The State appropriation for 1903 was \$50,000.

Religion.—The denominations rank in numbers as follows: Baptist, 20,016; Protestant Episcopal, 4,800; Free Baptist, 12,963; Congregational, 21,483; Methodist Episcopal, 10,585; Universalist, 3,003; Unitarian, 4,500; Roman Catholic (population), 106,000; Lutheran, 1,445; Presbyterian, 423; Advent Christian, 5,000; Friends, 1,800; Swedenborgian, 173; Christian, 3,600; Disciples, 500; Church of God, 250. In 1900 there were 2,020 evangelical Sunday schools, with 13,600 teachers and officers and 111,290 pupils. Sunday schools are maintained in connection with all the Roman Catholic churches.

Education.—In 1900 the school population was 161,600; enrolment in public schools was 131,588; and average daily attendance 97,706; enrolment in parish schools 11,000. There were 4,218 buildings used for public school purposes, 6,447 teachers; school property valued at \$4,699,475; receipts for the previous year \$1,507,345, and expenditures \$1,513,125. For the higher education there were 200 public high schools; 40 private secondary schools; 5 public and 2 private normal schools; Bowdoin College at Brunswick; Bates College at Lewiston; University of Maine at Orono; Colby College at Waterville; Westbrook Seminary at Deering; and Maine Wesleyan Seminary and Female College at Kent's Hill. There are academies at Hebron, Hampden, Lee, Bridgton, and other towns. The illiterate of 10 years and over were 5.1 per cent, but this per cent would have been lower if the test had been made from the standpoint of those who

could read or write in any language. A law of 1821 required that not less than 40 cents per capita of all inhabitants should be raised annually for school purposes. A public school fund was created in 1828 by setting apart 20 townships of lands belonging to the State. Moneys received from the United States for claims for services rendered in the War of 1812 were set apart for educational purposes. The compulsory law which covers the ages from 7 to 15 is strictly enforced. The district system has been abandoned and, instead the town system is in use. Since 1873 the State has aided towns where free academic instruction is given to the pupils. This instruction may be given in a high school within the town, or, since 1889, the town authorities may arrange for the education of its pupils with a high school outside the town. The number of free high schools receiving State aid in 1901 was 211. State institutes or summer schools for teachers are maintained by the State under the supervision of the State superintendent. The Indians are well provided with schools. The teachers' examinations and certificates are uniform and are in charge of the State. Strong efforts are made to have all the teachers normal school graduates. In 1903 about 25 per cent of those teaching in the schools were normal graduates.

Charitable Institutions.—There is a National Soldiers' Home at Togus, a United States Marine Hospital at Portland, State Insane Asylums at Augusta and Bangor, Military and Naval Orphan Asylum at Bath. There is also a Law School at Bangor, a College of Pharmacy at Orono, and Agricultural Experiment Station, all connected with the University. There are State Normal Schools at Farmington, Castine, Gorham and Presque Isle. The State General Hospital, State Reform School, School for Deaf Mutes, Maine Medical School, and Eye and Ear Infirmary, Home for Aged and Indigent Women, Old Men's Home, two Orphan Asylums (Protestant and Catholic), Young Men's Christian Association and Young Women's Christian Association, all located at Portland. City Hospital at Augusta, Central Maine at Lewiston, Eastern Maine General Hospital at Bangor, also at Bar Harbor, Old Town, and Rockland. There are two hospitals, five orphanages, and one Home for the Aged, under the auspices of the Roman Catholic Church.

Penal Institutions.—The State prison is at Thomaston, the State Industrial School for Girls at Hallowell, and the State Reform School about two miles from Portland. Prisoners in the county jails and convicts in the State prison are obliged to work, and the products of their labor are sold in the markets. Contracts are sometimes made for the labor of prisoners in the jails of some of the counties. The work of the inmates of the reform school is usually on the farm and in workshops. The girls at the industrial school are taught domestic work and some trades.

History.—Maine is supposed to have been visited by the earliest explorers: Corte-Real in 1501, and Verrazano in 1524, reported a coast the description of which corresponds with that of Maine. Gomez in 1525 sailed along the coast and named the Penobscot River, Rio de las Gamas, or Stag River. Sir John Hawkins, the famous Elizabethan seaman, explored the

coast in 1565, and Sir Humphrey Gilbert in the voyage which cost his life was on his way to the Penobscot region, then known as Norumbega, to settle a colony under a patent from Elizabeth. Bartholomew Gosnold, an Englishman (one of the founders of Jamestown, Va.), explored the coast in 1602, and Maine was visited by Martin Pring, in 1603, by De Monts in 1604, and by Weymouth in 1605. The first attempt to settle on the territory was made by the French under De Monts, who, having received a patent from the French king, planted a small colony on Neutral Island in the Saint Croix River in 1604. The first colony settlement attempted by the English was at the mouth of the Sagadahoc by George Popham and Raleigh Gilbert in 1607. A fort was erected and a number of buildings, and here the Virginia, the first vessel built in the country, was launched and subsequently formed one of the fleet of the Somers and Gates Colony in 1609. The colony at Sagadahoc was broken up by the death of Popham and great hardships endured by the colonists. They returned to England in the autumn of 1608. In 1613, French Jesuits established a mission on Mount Desert Island, but they were expelled by the English the next year. In 1614, the coast was visited by John Smith, who found a few scattered settlers around Pemaquid Bay and on the island of Monhegan, off the coast of that part of the State now included in Lincoln County. In 1616 Sir Ferdinando Gorges, "The father of American Colonization," who had sent Pring and Popham to Maine, sent his agent, Richard Vines, to Saco to remain during the winter to explore the country and test the climate. In 1620, the King of Great Britain made a division of the grand charter of 1606, and granted to the Plymouth Company in England the whole country lying between 40° and 48° N., and to the Virginia Company the southern portion of the original patent. On 10 Aug. 1622, Gorges received a patent of territory between the Merrimac and Kennebec rivers, and the next year sent his son Robert as Governor and Lieutenant-General of the country, accompanied by several councillors and a minister of the Church of England to establish worship. In 1629, another division of lands was made giving to Sir Ferdinando Gorges the country between the Piscataqua and Kennebec rivers, to which he gave the name of New Somersetshire, and the remainder to John Mason. The first court in the Province was convened by William Gorges, nephew of Sir Ferdinando, at Saco, 21 March 1636. Charles I. granted to Gorges in 1639 a charter under which in 1641 Gorges established the first chartered city in the United States, under the name of Gorgeana, and constituted it the capital of the province. What was then Gorgeana is now York. Its original name was Agamenticus. A fort was built here and efforts made to protect the people against the Indians. From 1630 to 1632, settlements were commenced in Saco, Biddeford, Scarborough, Cape Elizabeth, and Portland, all of which continued to prosper till the Indian War of 1675, when they were overthrown. Massachusetts claimed a portion at least of the territory of Maine on the ground that its charter included the lands as far north as three miles above the source of the Merrimac; but those to whom other charters had

MAINE

been given resented her interference. In 1677, Massachusetts purchased from the heirs of Gorges all their interest in the Province of Maine. A new charter, issued by William and Mary, in 1691, combined the provinces of Massachusetts, Plymouth, Acadia, Maine, and Sagadahoc into one province, called "The Royal Province of Massachusetts Bay." Maine was now a part of Massachusetts. Remote from the centre of white settlements of any great size, Maine suffered from attacks by Indians, especially during the French and Indian wars. When King Philip's War was ended there were within its boundaries only five settlements.

Among the first soldiers in active service in the Revolutionary War were men from Maine, who fought as Massachusetts troops. A regiment from Maine was present at Bunker Hill. The British fleet, in 1775, attacked and destroyed Portland and Falmouth. Off Machias was fought the battle in which the *Margaretta*, a British ship, was captured. At the close of the War Massachusetts still retained possession of the country and called it the "District of Maine." The people of Maine were divided in their allegiance to Massachusetts, one party desired to remain a part of the "Bay State" and another party wanted independent statehood. The separatist movement gained ground during the War of 1812. Maine was admitted into the Union as a State 15 March 1820.

The northeastern boundary continued a source of dissension with Great Britain, or between the people of Maine and New Brunswick until after the ratification of the Ashburton Treaty (q.v.), which practically settled the eastern boundary between the United States and Canada.

The lumbering industry has always been most important, and since 1888-90 there has been a considerable development of manufacturing industries. The legislation of the State has been marked by conservatism and sound judgment. In 1851 Maine adopted a prohibitory liquor law which has since been embodied in the constitution of the State. During the Civil War Maine furnished 70,107 soldiers, of whom 9,398 died during the War and a large number returned to their homes disabled invalids.

The State went Democratic at State elections (except 1840) till 1855, when Anson P. Morrill was elected governor as the candidate of the "Know-Nothing" party and also of those who favored a prohibitory law. Since 1856 its elections have gone Republican except in 1878 and 1880, when the Democrats and Greenbacks on a fusion ticket elected their candidates. In 1879 a dispute arose as to the legality of the election of some of the members of the legislature and of the governor. For a time a disturbance was feared, but the militia preserved peace until the Supreme Judicial Court rendered a decision making the Republican candidates legal members of the legislature. The State has had no serious internal troubles except the "Know-Nothing" agitation in 1854-6, and the dispute about the legislature in 1879. The Australian ballot law was passed in 1891.

Since Maine became a State there have been 39 different governors, some of whom have held the office for more than one term.

JAMES PHINNEY BAXTER (A.M., Litt.D.).

Maine, France, an old province having Normandy on the north, Brittany on the west, and Anjou and Touraine on the south, and Orléannais on the east. In corresponded to the modern departments of Sarthe and Mayenne.

Maine, University of, The, is a coeducational institution, located at Orono, Maine, on the Penobscot River, eight miles above Bangor. It is one of the institutions that owes its existence to the Act of Congress of 1862, commonly known as the Morrill Act. The 210,000 acres of land which were, by this act, conveyed to the State for the purpose of establishing a college of agriculture and mechanic arts, were sold at a low price, and there resulted an endowment for the college of \$118,300. The income of the institution is derived from interest on this endowment fund and on other bequests of private nature, an annual appropriation by the State, student fees, and the income of the second Morrill Act of 1890. The total income from all sources for the year 1904, exclusive of special appropriations for buildings, was about \$90,000.

The legislature of Maine accepted the grant of land in 1863, but the college was not opened to students until the autumn of 1868. During the years intervening between the acceptance of the government grant of land and the formal opening of the institution there was much excited discussion in the State as to the manner in which the grant of land should be utilized. Each of the three classical colleges already existing in the State was willing to establish an agricultural and mechanical department if it could secure the income from the fund. The matter was settled in 1865 by the legislature constituting a corporate body to be known as "Trustees of the State College of Agriculture and the Mechanic Arts." Each county in the State had a representative on the board of trustees, and the president of the board was Hon. Hannibal Hamlin, Vice-President of the United States at the time of the passage of the land-grant act. Thus was begun the organization of a new institution, unhampered by tradition. Over the location there arose so bitter a controversy that after Orono was determined upon as the seat of the new college, the board, at its own request, was legislated out of office and an entirely new board

MAINE—MAINTENON

of seven members was created. From the day of opening, in 1868, when twelve students enrolled themselves, the institution has prospered. Until 1897 the institution was known by the name "State College of Agriculture and Mechanic Arts." The legislature of 1897 changed the name to "The University of Maine." The most rapid progress has been noticed since the change of name. The University of Maine includes all that there was in the Technical College and appeals also to a broader constituency. The number of students (1904) is 551.

Although the institution is by law co-educational, the number of female students has never exceeded 30 at any one time. This is accounted for by the fact that the technical courses attract large numbers of young men, and that there are two other colleges in the State which admit women. The faculty numbers 65. There are 23 departments in which instruction is given. These departments are divided into colleges of Arts and Sciences, Agriculture, Technology, Pharmacy, and Law. The degree of B.A. is given for the completion of such courses in the College of Arts and Sciences as contain a minimum of one year of Latin. The degree of B.S. is given for all other courses in the Colleges of Arts and Sciences, of Agriculture, Technology, and Pharmacy. The degree of LL.B. is given those who graduate from the College of Law.

In the College of Arts and Sciences instruction is given in the departments of Greek, Latin, Romance Languages, Germanic Languages, English, Philosophy, Civics, History, Mathematics and Astronomy, Physics, Chemistry and Biology. In the College of Agriculture instruction is given in Agriculture, Animal Industry, and Horticulture. In the College of Technology instruction is given in Chemistry, Civil Engineering, Mechanical Engineering, Electrical Engineering, Mining Engineering, and Forestry. The colleges of Pharmacy and of Law are not subdivided.

Fully one half of the students are pursuing the various engineering or other technical courses. The governing body of the institution is the board of trustees, consisting of eight members, appointed by the governor and council. One of these trustees is appointed from the alumni upon recommendation of the alumni association. There are upon the grounds 14 buildings which are used for purposes of instruction, and 17 other buildings which are used as dormitories, residences, dining halls, etc. The engineering, chemical, and biological laboratories are thoroughly equipped. The museum contains specimens of all the animals and birds of Maine and many of other parts of the United States. The library contains about 27,000 volumes. An astronomical observatory is equipped with an eight-inch refracting telescope, together with other instruments of the best quality and of sufficient number for thorough instruction in both descriptive and practical astronomy.

Entrance to the university is obtained by passing the entrance examinations, or by presenting a certificate from one of the schools approved by the New England College Entrance Certificate Board. This is an organization composed of the larger number of the New England colleges. All of the colleges in the organization will accept certificates from schools which have

been approved by the executive committee of the board.

The University Council, composed of four members of the faculty, and five students, elected by the two upper classes, is a body with advisory powers which exerts the chief influence in the determination of all student and faculty relations.

Great interest is taken by the student body in all branches of athletics, and this interest is heartily approved by the faculty. Strong teams compete each year with those of other New England colleges, in baseball, football, basketball, tennis and track games. The students also maintain an excellent band, an orchestra, a glee club, banjo, guitar and mandolin clubs, and debating club. A noteworthy feature of student life at the University of Maine is found in the chapter houses of the various fraternities. Eight fraternities maintain elegant houses of their own, in which they live as families and frequently entertain their friends. Although a friendly rivalry exists, there is never ill feeling among the fraternities, and all co-operate in furthering all college interests.

The Law School, located in Bangor, was established in 1898. It has an excellent library, maintains a three-year course, and has (1904) 76 students, more than one third of whom are college graduates.

GEORGE EMORY FELLOWS,
President of the University of Maine.

Maine, The, a battleship of the United States navy, mysteriously destroyed by explosion 15 Feb. 1898, just prior to the commencement of the Spanish-American war. The disaster, which occurred in the harbor of Havana, Cuba, caused the death of 257 American sailors. (See CUBA: SPANISH-AMERICAN WAR.) Another warship of the same name was launched in 1903.

Maine de Biran, măn de bê-răn', **Marie François Pierre Gonthier**, French philosopher: b. near Bergerac, in the department of Dordogne, 29 Nov. 1766; d. Paris 20 July 1824. He received his early education at Périgueux, and in 1785 joined the army under Louis XVI. He was elected to the Five Hundred in 1797, became *sous-préfet* of Bergerac in 1806, was made a count of the empire in 1809, and in 1816, after changing his residence to Paris, became a member of the loyal chamber. Only a few of his minor essays were published during his lifetime, but upon his death Cousin obtained access to his papers and published a portion of his works in 1841. Neville printed his 'Life' in 1851, and in 1859 edited a complete edition of his works, the most important of which are: 'Nouvelles considérations sur les rapports du physique et du moral de l'homme'; 'Œuvres philosophiques'; 'Nouveaux essais d'anthropologie'; and 'Essai sur les fondements de psychologie.' Maine de Biran was considered the founder of modern French Spiritualism and was much inclined toward mysticism when he died.

Maintenon, **Françoise d'Aubigné**, frăn-swăz dô-bên-yă măn-tiê-nôn, MARCHIONESS DE, French queen: b. Niort, Poitou, 1635; d. Saint-Cyr, 1719. Her birthplace was the prison in

which her profligate father and unfortunate mother were confined. From her father's death in her 10th year she was the poverty-stricken ward of her grudging guardian and aunt, Madame de Neuillant, who dressed her like a peasant and set her to guard the poultry. Yet her humiliation did not embitter her bright and cheerful disposition. The famous wit and man of letters, Scarron, deformed, old, and infirm as he was, became her husband, and she was soon the centre of the clever literary people who frequented his house. When Scarron died, her good sense and delightful disposition recommended her to many friends, who pointed her out to Louis XIV. as a fitting person to take charge of the education of the children born to him by Madame de Montespan. She undertook the office of governess to the royal children, won their affection and respect as well as that of the king, who married her in 1685, when she was 50 and he 47. There can be no doubt that she exercised a beneficent influence over the king's private life. She was undoubtedly disinterested and charitable, her character above stain in a profligate age, and her mind clear and resolute in pursuing the course she knew to be right. She survived the king four years and died at the nursery which she had changed into a place of education for the poor daughters of decayed families, having enjoyed to the end all the honor and position of a royal widow. Consult: Noailles, 'Histoire de Mme. de Maintenon' (1848-58); Geffroy, 'Mme. de Maintenon d'après sa Correspondance authentique' (1887).

Mainz, mînts, Germany, a town in the grand-duchy of Hesse-Darmstadt, on the left bank of the Rhine, opposite the mouth of the Main, 20 miles by rail southwest of Frankfurt. It is a fortress of the first rank, an episcopal see, and a river port. The town rises gradually from the Rhine in the form of an amphitheatre. A railway bridge spans the Rhine a little above its junction with the Main, and a stone bridge connects with the opposite suburb of Kastel. A handsome quay, 330 feet wide, extends along the Rhine for a considerable distance, and large modern harbors have been constructed. The principal edifices are the cathedral, recently restored, a vast building of the 11th century; the former electoral palace, now containing the city library (180,000 vols.), picture-gallery, museum of Roman and Roman-German antiquities, etc.; the old collegiate church of St. Stephen, occupying the highest site in the town, the Church of St. Peter, the German House, or grand-ducal palace with the arsenal adjoining; the courts of justice, the government buildings, public hall, two new concert halls, central railway station, etc. One of the most interesting objects in the town is the house of Gutenberg which contained his first printing-office. A bronze statue of Gutenberg, by Thorwaldsen, stands in an open space near the theatre. The great open-air resort is the *Neue Anlage*, outside the gates, consisting of extensive public gardens, and commanding fine views of the town and surrounding district. The manufactures consist chiefly of leather, furniture, hardware, carriages, carpets, tobacco, beer, chemicals, musical instruments, gold and silver wares, machinery, soap, hats, etc. The trade, particularly transit, is extensive. The principal articles are Rhenish wine, corn,

flour, oil, coal, and wood. Mainz owes its foundation to a Roman camp which Drusus pitched here. On the decline of the Roman power it was almost entirely destroyed, but was afterward rebuilt chiefly by Charlemagne, and became the first ecclesiastical city of the German empire, of which its archbishop-electoral ranked as the premier prince. Pop. (1900) 84,335.

Maipo, m'poo, or **Maipu**, a river in Chile, having its rise in the Andes Mountains and flowing almost due west into the Pacific Ocean. It is 120 miles in length. The falls and rapids furnish valuable water-power, which has not been utilized to any great extent. The city of Santiago is a few miles north of the river. On 5 April 1818 was fought on the banks of the Maipo the battle which decided the independence of Chile.

Mair, mār, **Charles**, Canadian writer: b. Lanark, Ont., 21 Sept. 1840. He was educated at Queen's University, Kingston, and entered journalism. He aided in quelling the Riel insurrections and was one of the organizers of the "Canada First" party. Among his works are: 'Dreamland and Other Poems' (1868); 'Tecumseh,' a drama (1886).

Maisonneuve, mā-zō-nèv, **Paul de Chomedey**, SIEUR DE, French colonizer: b. Champagne, France; d. Paris 9 Sept. 1676. He enlisted in the French army at 13 and later organized a band of colonists with whom he landed at Quebec in 1641. In 1642 he founded Montreal and was for 22 years its governor but was absent for a time in 1652 when he returned to France to conduct to America a new party of settlers. He displayed great administrative ability, but through the jealousy of De Mézy, governor-general of Canada, was in 1664 recalled to France by De Tracy. Though no charges were made against him he found no possibility of reinstatement in office and resigned in 1669.

Maistre, Joseph Marie, zhō-zéf mā-rē mǎstr, COMTE DE, French philosopher and savant: b. Chambéry 1 April 1754; d. Turin 26 Feb. 1821. He was of French extraction and was a senator of Piedmont at the time of the French invasion (1792). He left his country in consequence of that event, and afterward followed his king to Sardinia. In 1804 he was sent ambassador to Saint Petersburg, and returned finally to Turin in 1817. De Maistre was familiar both with Greek and Latin literature, and his writings in French have obtained the highest praise of critics. He was a conservative in politics, religion, and philosophy, a supporter of absolute monarchy, and of the infallibility of the pope. His 'Mémoires politiques et Correspondance diplomatique' (1858), however, shows him in the light of a much more discerning and less uncompromising politician than his formal treatises, and indicates a large and liberal appreciation of the revolution which he opposed. As a diplomatist he exerted himself to effect the restoration of all his former possessions to his master, and to obtain the transfer of Genoa. Among his political writings are his 'Eloge de Victor Amadée III.'; 'Considérations sur la France' (1796); 'Essai sur le Principe Géné-

rateur des Constitutions politiques' (1810), in which he maintains the divine origin of sovereignty; 'Soirées de St. Petersburg'; 'Du Pape' (1819); 'De l'Eglise gallicane'; and 'Du Congrès de Rastadt' (the last with the Abbé de Pradt).

Maisur, mi-soor'. See **MYSORE**.

Maitin, José Antonio, hō-sā' ān-tō-nē'ō mī'tān, Venezuelan poet: b. Porto Cabello 1798; d. Choroni, Venezuela, 1874. In 1824 he returned from Havana to his own country whence he had fled on account of persecution, and made his home in the valley of Choroni. In 1844 his best poems were collected and published with the title 'Echos from Choroni,' and in 1851 a collected edition of all his works appeared.

Maitland, māt'land, Frederick William, English historian: b. England 28 May 1850; d. 21 Dec. 1906. He was graduated from Trinity College, Cambridge, and studied law; in 1884 was made reader of English Law at Cambridge and from 1888 was professor of the same branch there. He read widely on legal history and was a generally recognized authority. Among his works are: 'Gloucester Pleas' (1884); 'History of English Law,' with F. Pollock (1895); 'Canon Law in England' (1898); 'English Law and the Renaissance' (1901); etc.

Maitland, J. A. Fuller. See **FULLER-MAITLAND, J. A.**

Maitland, Sir Peregrine, British soldier: b. Hampshire, England, 1777; d. London 30 May 1854. He enlisted in the army in 1792 and was promoted rapidly, serving in Spain and at the battle of Waterloo, where he was a major-general. In 1818 he was appointed lieutenant-governor of Upper Canada and in 1828-34 was governor of Nova Scotia. He was made lieutenant-general in 1830 and commanded the Madras army 1836-8. From 1843-6 he was governor-general at the Cape of Good Hope.

Maitland, Sir Richard, Lord LETHINGTON, Scottish poet and antiquary: b. Scotland 1496; d. Edinburgh 20 March 1586. He was educated at St. Andrews and was one of the great lawyers of his day, and although he became blind in 1560 was nevertheless made a member of the privy council, and in 1562 keeper of the great seal. His manuscript collection of early Scottish poetry is preserved at Magdalen College, Oxford, and his own poems were published by the Maitland Club of Glasgow in 1830.

Maitland, William, Scottish statesman: b. Scotland about 1528; d. Leith 9 June 1573. He was a son of Richard Maitland, Lord Lethington, and was educated at St. Andrews and on the Continent. He early entered political life and was interested in the Knox reform movement; in 1558 he was appointed secretary of state by Mary of Guise, and is commonly called "Secretary Lethington." He was one of the commissioners who concluded the treaty of Berwick and in 1560 was speaker of the Scottish Parliament. He was one of Mary's ministers on her return from France, but was suspected of having betrayed her to Queen Elizabeth. In 1563 Maitland conducted a prosecution for treason against Knox whom he had earlier supported, and in 1565 he became lord of the sessions but was removed from office for implication

in Rizzio's murder; he was also connected with the murder of Darnley. He contrived Mary's escape from Lochleven but fought against her at Langside. After the assassination of Moray he became the leader of the queen's party and was active in her support. In 1571 he was attainted for treason by Parliament as a result of joining Kirkcaldy at Edinburgh, whom he encouraged to hold the castle until the last. He was taken prisoner at its surrender and died in prison. Consult: Skelton, 'Maitland of Lethington and the Scotland of Mary Stuart' (1887-8).

Maitland, Australia, town, in Northumberland County, in New South Wales; on the Hunter River; about 100 miles north of Sydney. It is connected by railroad with Newcastle, about 15 miles distant. The Hunter River divides the town into East and West Maitland, two distinct municipalities, West Maitland being the larger. The Hunter River frequently overflows its banks and floods the town and surrounding country. Although serious devastation results, the soil has been enriched by this flooding, and so fertile is this section that Maitland is called the "granary of New South Wales." Grapes, grains, tobacco, and vegetables grow in abundance. Large coal fields are near the town. Considerable manufacturing is carried on, especially in West Maitland. Pop. (1901) 10,085.

Maize. See **CORN, Indian.**

Majen'die, Sir Vivian Dering: b. Pipe Grange 18 July 1836; d. Oxford, England, 24 April 1898. He was educated at Leamington College, commissioned in the Royal Artillery in 1854 and first saw active service in the Crimean war, in which he won the medal with clasps, and the Turkish medal, and he achieved further distinction in the Indian Mutiny. He became captain of artillery in 1861, major in 1872, lieutenant-colonel in 1880 and colonel (retired) in 1882. He was created Commander of Bath in 1880 and Knight Commander in 1895. Was 10 years on duty at the Woolwich Arsenal and in 1871 attached to the Home Office as Inspector of Gunpowder Works under the Gunpowder and Nitroglycerin Acts. He was largely instrumental in passing the Explosives Act of 1875.

It was fitting then that after having had so wide an experience and displayed such thorough acquaintance with the subject, Maj. Majendie should, on the passage of the Act, have been appointed chief inspector. While in this office his investigations of dynamite outrages brought him most conspicuously before the public, his most important service to his country was in so drawing and enforcing the regulations in explosive works as to render employment in these factories among the less hazardous of occupations for British workmen while all mankind benefited from the exhaustive examinations which he made into accidents arising in the manufacture and use of explosive substances and his admirable reports in which he traced out the causes and offered practical suggestions by which to prevent the recurrence of these disasters. His influence has extended far beyond the confines of his country. For his successful efforts to ameliorate the condition of man he takes rank with Davy, Jenner, Francis, Lister and Florence Nightingale. His monument is the 22 Annual and 50 Special Reports which bear his signature

MAJESTY — MAKART

as Her Majesty's Chief Inspector of Explosives.

CHARLES E. MUNROE,
Professor of Chemistry, *Columbian University*.

Majesty (Latin, *majestas*). *Majestas*, in a collective sense, was used in republican Rome to signify the highest power and dignity, the attribute of the whole community of citizens, the *populus*. The *majestas* was also ascribed to the dictator, consul, and even senate, though in the case of the last the word *auctoritas* was used in preference. At a later period, under the Roman emperors, *majestas* was the name of the imperial dignity, whilst that of a magistrate was called *dignitas*. To kings the attribute of majesty was given much later. The courtiers introduced the title into France under Henry II. In the Treaty of Crespy (1544) Charles V. is styled *imperial*, Francis I. *royal majesty*; and in the Peace of Câteau-Cambrésis (1559) the titles of *most Christian* and *Catholic majesty* are found for the first time. In England Henry VIII. first adopted the title *majesty*. At present this title is given to all European emperors and kings.

Majolica (Ital. *mā-yō'li-kā*), or **Maiolica** (from the Italian name of the island of Majorca, q.v.), a decorated, enameled pottery made in Italy from the 15th to the 18th century. Majolica is an earthenware manufactured from coarse clay paste and covered with a stanniferous glaze or enamel. It has sometimes been called "Raphael ware" from the fact that a number of the paintings on it were copied from the designs of that famous painter.

Major, Charles, American novelist: b. Indianapolis, Ind., 25 July 1856. He was educated in the public schools and studied law, establishing a practice at Shelbyville. He has contributed to various magazines and has published: 'When Knighthood was in Flower' (1898); 'The Bears of Blue River' (1900); and 'Dorothy Vernon of Haddon Hall' (1902).

Major, (1) in music, a term applied to imperfect concords, but chiefly to the interval of the third. It also denotes that one of the two modern modes in which the third is 4 semitones above the tonic or key note. (2) In military science, the major is a field officer ranking next below a lieutenant-colonel and above a captain. He has generally the command of a battalion, the exercises of which he superintends, and in action or on parade carries into effect the orders of his superior officer. The term in the French service has been superseded by that of *chef de bataillon*. A brigade major is an officer who performs for a brigade, or in garrison, the duties ordinarily discharged by a major in a regiment or battalion. A major-general ranks next below a lieutenant-general. In other cases, the term major, when applied as an epithet to the several denominations of men in an army, signifies the superior of the department; as sergeant major, the chief non-commissioned officer in a regiment, who assists the adjutant; drum major, the chief of the drum corps, etc.

Majorca, *ma-jōr'ka* (Spanish *Mallorca*; Latin, *Balearis Major*), Spain, an island in the Mediterranean, the largest of the Balearic group; area, 1,420 square miles. It is about 120 miles distant from Spain. It is very irregular in shape, and deeply indented, particularly in the northeast. Pop. (1901) 252,000.

Majuba (*mā-joo'bā*) Hill, an eminence in the extreme north of Natal, the scene of the defeat of 648 British troops, with the loss of their

leader, Sir George Colley, by a superior force of Transvaal Boers, 27 Feb. 1881. The attack was unexpected, and the Boers found the British resting after a night march and a climb of eight hours. The loss of the Boers was about 130, of the British more than 200 in killed and prisoners, besides many wounded and some missing. To the British nation the name Majuba Hill became a synonym for disaster. The anniversary of this fight was marked by the success of Lord Roberts, commander of the British forces in the campaign of 1900, when he received the surrender of the Boer commander, Gen. Cronje.

Makaroff, Stepan Osipovich, Russian vice-admiral: b. in 1848; d. 13 April 1904. He entered the navy in 1864 and received rapid promotion for distinguished services. During the Russo-Turkish War 1877-8, he commanded the gunboat Grand Duke Constantine, and for a series of daringly successful attacks upon Turkish ports, which earned him the title of "the Cossack of the Sea," he was promoted captain of the second rank, aid-de-camp to the late Tsar Alexander II., was decorated with the orders of Saint Vladimir and Saint George, and received a golden sword of honor. In 1881 he took part with the legion of Skobelev in the capture of Geok Tepe in which Gen. Kuropatkin also figured prominently. The same year he commanded the cruiser Taman, the station guardship of the Russian embassy at Constantinople, and made a careful and complete study of the defenses of the Bosphorus. In 1882-3 he was chief-of-staff of the offensive squadron in the Baltic under Admiral Chihacheff, Minister of the Navy. From 1891 to 1894 he was engaged in improvements of ordnance; among his inventions were the so-called cap guns possessing 20 per cent greater power of penetration into the newest superimposed armor; and the Ermak ice-breaker, the first of the ice-breaking vessels now used in Baltic and northern Asiatic waters. After the disastrous attack of the Japanese on the Russian fleet at Port Arthur in February 1904 Vice-Admiral Makaroff was sent to the Far East to direct the Russian naval operations, and arrived at Dalny 8 March. He repaired and converted the blockaded squadron into an active aggressive naval force, but on 13 April was lured out of harbor by a decoy squadron. Discovering the Japanese main fleet trying to intercept him he at once returned and was about to enter the harbor, when his flagship, the Petropavlovsk, was destroyed by one of the sunken mines laid by the Japanese across the passageway, and Vice-Admiral Makaroff, his guest Vasili Verestchagin (q.v.), the famous war-artist, 16 staff officers, and over 800 sailors perished.

Makart, māk'ärt, Hans, Austrian painter: b. Salzburg 28 May 1840; d. Vienna 3 Oct. 1884. He began his art studies in the Academy of Vienna. In 1859 he went to Munich, and painted in the studio of Piloty, under whose teaching (1861-5) he developed remarkable talent as a colorist. His earliest success was a Rembrandtesque picture of 'Lavoisier in Jail' (1862). His first work to gain him wide fame was his three-paneled picture, 'The Seven Deadly Sins' or 'The Plague in Florence,' which aroused a storm of adverse criticism, wonder and admiration in Paris and Germany. In 1869 the Emperor Francis Joseph built him a fine studio in

Vienna, and he produced his series of 'Abundantia' pictures, 'Fruits of the Earth'; 'Fruits of the Sea.' In 1873 followed the picture which attracted so much attention in the Exhibition of Philadelphia (1876) his 'Venice Doing Homage to Caterina Cornaro,' now in the National Gallery at Berlin. He traveled in the East during the winter (1875-6), and his Egyptian sketches materialized in his 'Cleopatra,' 'Antique Hunt on the Nile,' etc. His 'Entry of Charles V. into Antwerp' (1875-8) gained a medal at the Paris Exposition of 1878 and his 'Diana's Hunting Party' is one of the most successful of his larger paintings, combining superb coloring and modeling of the nude with grand landscape effect. It is in the Metropolitan Museum of New York and is most characteristic of the gorgeous sensuousness of a painter who woke the intellectualists of German art to a sense of color, and broke free from the traditions of a somewhat stiff and pedantic method, gaining in life and intensity what he sacrificed of academic correctness. Consult: Lütow, 'Hans Makart' (1886); Stiassny, 'Hans Makart und seine bleibende Bedeutung' (1886).

Mak'emie, Francis, pioneer of the Presbyterian Church in the United States: b. Rathmelton, County Donegal, Ireland, 1658; d. Accomac County, Virginia, 1708. He was a born missionary and zealot, and on being licensed by the Presbytery of Laggan sailed for the British West Indies, and began work in Barbados. In 1684 he sought a wider field in Maryland and organized the first Presbyterian congregation at Snow Hill, capital of Worcester County, Md. After 10 years' labor as an itinerant preacher in most of the Southern States he returned to England and induced two other ministers to accompany him back. He was the first moderator of the Presbytery of Philadelphia (1706), which he assisted in forming; and visited New York (1707), where he was imprisoned for preaching, though when brought to trial was acquitted of lawbreaking. Consult Briggs 'American Presbyterianism' (1885).

Malabar, māl-a-bār, British India, in the Presidency of Madras, in the southwest bordering on the Arabian Sea. A great portion is low land along the coast, rising abruptly at the east where it is bounded by the Western Ghats. The western part is intersected by long, narrow ravines, and the whole is covered with vegetation, in many place large forests. There are a number of tea and coffee plantations and a large amount of rice is raised. The principal towns are Cochin, Callicut, Tellicherry, Kananur, and Mangalore. The name Malabar is often applied to the whole extent of coast country from Cape Comorin as far north as Bombay.

Malabar Nightshade, a succulent edible vine. See **BASELLA**.

Malabón, Santa Cruz de, sãn'tã croot'h dã mã-lã-bôn', Philippines, a pueblo of the province of Rizal, Luzon, also known as Tambobong. See **TAMBÓBONG**.

Malabuyoc, mã-lã-boo'yók, Philippines, a pueblo of the province of Cebú, situated at the mouth of the Malutoc River on the strait of Tañon, 60 miles southwest of Cebú, the provincial capital. Pop. 13,120.

Malacca, mã-lák'ã. See **STRAITS SETTLEMENTS**.

Malac'ca Cane, an erect, slender-stemmed palm (*Calamus scipionum*) which, when dressed, is of a brown color, sometimes mottled or clouded. It is used principally for walking-sticks, and is brought from Singapore and Malacca, but is chiefly produced in Sumatra.

Malacca, Strait of, the channel between the Malay Peninsula and the Island of Sumatra, extending from lat. 1° to about 6° N. Entire length, about 520 miles; breadth, varying from 25 miles to 250 miles.

Malachi, last of the Hebrew minor prophets: he was contemporary with Ezra, writing about 450 B.C. Malachi's work was supplementary to that of Nehemiah and Ezra, who were struggling to preserve the integrity of the nation by opposing intermarriage with the heathen and to maintain the purity and persistency of the temple worship by which alone priests and people could be kept together as holy to the Lord. The prophet begins his message by showing that Jehovah still loves and favors his own people in contrast to the visitation he had brought upon Edom. He condemns the neglect and moral perversion of the priests who despise and prove ungrateful to God by the profanity of their niggardly offerings. He only is a true priest who recognizes his covenant obligation to God, and whose life and service are in keeping with it. The shortcomings of the people are next dealt with. Their intermarriages with heathen women and their divorces are an abomination. The coming of God's messenger, then of God himself in judgment, is announced. The day of Jehovah is near; in which the righteous shall triumph and the wicked perish. The law of Moses must be observed, and the coming of Elijah expected as a preparation for that day. The book of Malachi is argumentative and practical. It is plain and convincing. The prophet startles his hearers by stating their own objections, and answering them. Thus contemporary moral and religious life are plainly depicted, in the language of rhetoric rather than of poetry.

Mal'achite, a native basic copper carbonate and hydrate, having the composition $\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$, crystallizing in the monoclinic system, but commonly occurring in massive form, or as an incrustation. It is brittle, and has a specific gravity of about 4, and a hardness of from 3.5 to 4. Malachite is commonly subtranslucent, with an adamantine lustre. It is beautifully green in color, often banded with other colors, and it occurs in many parts of the world, usually in connection with other ores of copper. Specially fine pieces are found in the Ural district, and at the Nizhni Tagilsk copper mines a deposit is known which contains at least half a million pounds of pure malachite. In the United States, the best known deposits are those of Arizona. Malachite has been much prized as a gem stone, and it is extensively used for panels, clock cases, table tops, and other ornamental work.

Malachy, Saint, Irish bishop: b. Armagh 1095; d. Clairvaux, France, 1148. He belonged to the noble family of O'Morgair, was educated by Iombair, an anchorite, and ordained priest in 1119. He afterward studied at Lismore, and returning to Armagh was chosen bishop of Down and Connor (1125). His subsequent election to

MALACOLOGY—MALARIA

Armagh having been disputed (1129) he eventually returned to the less important diocese, and the last moments of his life were spent with St. Bernard, whose monastery he had visited for the purpose of meeting Pope Eugenius. The document known as 'Prophecy of Saint Malachy' containing a Latin motto for each of the popes, is not now considered to be his production. He was canonized in 1189. Consult: O'Hanlon, 'Life of Saint Malachy' (1899).

Malacol'ogy. See CONCHOLOGY.

Malacopterygii, mál-a-köp-tě-rīj-ī-ī, or **Malacop'teri**, a group of fishes, in former systems of classification, including those with jointed and spineless or "soft" fin-rays. Compare **ACANTHOPTERYGII**; and see **ICHTHYOLOGY**.

Malacos traca, one of the two primary divisions of the *Crustacea* to which all of the larger and more highly organized forms belong. The number of pairs of appendages and of segments is definite, the former being always 10 and the latter 19, except in the order *Leptostraca* which have also two abdominal segments limbless. The boundary between head and thorax is not always clearly defined but the two always comprise 13 segments, of which 5 almost always belong to the head; the abdomen has six limb-bearing segments and is terminated by the telson which is probably a seventh segment. The head bears a pair of eyes, usually stalked, two pairs of antennae, a pair of crushing jaws or mandibles and two pairs of maxillae, to which a pair of maxillipeds is sometimes added (*Arthrostraca*). Of the typically 8 thoracic segments from 1 to 3 bear maxillipeds and the remainder walking feet. In most cases the thorax is more or less completely covered by a carapace. The mode of development is varied, sometimes, as in the crayfish, it is direct, sometimes with a nauplius, but usually through the larval form called zœa (see LARVA), which possesses paired eyes as well as a median eye, a swimming tail and usually 7 pairs of appendages. The subdivisions are:

Order *Leptostraca* (*Nebalia*).

Order *Arthrostraca* { *Amphipoda* (beach flea?)
Isopoda (wood lice).
Order *Thoracostraca* { *Cumacea* (*Diatylis*).
Stomatopoda (*Squilla*).
Schizopoda (*Mysis*).
Decapoda { *Macrura* (lobsters
and shrimps).
Brachyura (crabs).

Malade Imaginaire, mā-lād ē-mā-zhē-nār, **Le**, a comedy in five acts by Molière. It was produced in Paris (1673), was the last work of its author, and the last in which, as Argan, he appeared on the stage. See **MOLIERE**.

Malaga, mă'l'a-ga, Sp. mă'lă-gă (ancient MALAGA), Spain, capital of the province of Malaga; on a small arm of the Mediterranean; about 70 miles northeast of Gibraltar. It was a flourishing city under the Romans, and its long occupation by the Moors has left distinct marks in the older parts of the town; the Gibralfaro, or Moorish castle, on a hill overlooking the town, and considerable portions of the ancient fortifications, yet remain. Among the important buildings are the cathedral, a highly decorated structure in the composite style with a spire 300 feet high; the Episcopal palace, custom-house, and several hospitals and charitable institutions, etc. The manufactures consist chiefly

of iron, the ore of which is obtained from rich mines in the vicinity; soap, cottons, linens, machinery, etc. The harbor is excellent and the trade is of importance, the principal exports being olive-oil, lead in bars, wine, and fruit, particularly raisins, oranges, and almonds. The climate is one of the mildest and most equal in Europe. Pop. (1902) 132,015.

Malaga Wine, a sweet Spanish wine produced in the province of Malaga. It is one of the "muscatel" wines, and is rich, luscious, and full of body. See also **WINES**.

Malagasy Subregion, a faunal division of the Ethiopian Region in Zoogeography which embraces Madagascar and some small neighboring islands. See MADAGASCAR; ZOOGEOGRAPHY.

Malakoff, mä'la-köf. See SEBASTOPOL.

Malampaya, mǎ-lām-pǎ'yǎ, a sound on the northwest coast of the province of Paragua, island of Palawan, Philippines; it is an arm of the China Sea, extending 24 miles from northwest to southeast, and from 3 to 6 miles wide. It is entirely landlocked, Tukuran island protecting it from the China Sea, and is entered by Blockade and Endeavor Straits. Its depth varies from 36 to 54 feet, it is free from sunken dangers to navigation, is one of the finest harbors in the Philippine archipelago, and has been suggested as one of the best locations for a naval station between Balabac and Manila.

Malanao, mā-lä-now', the name commonly given the Moros, especially Ilanos, who live on the shores of Lake Malanas, island of Mindanao. See PHILIPPINE ISLANDS.

Mal'aprop, Mrs., a character in the 'Rivals' of Sheridan. Like Shakespeare's Dogberry she is made to employ words of the same length, accent, and more or less similar vowel and consonantal value, interchangeably. Hence her well-known 'Allegory on the Banks of the Nile'; 'Derangement of Epitaphs'; 'A Barbarous Vandyke'; etc.

Malapteru'rus. See ELECTRIC FISHES.

Mälär, mä'lär, Lake of, Sweden, a lake running inland from the Baltic about 81 miles, with an average breadth of 13 miles and an area of 525 square miles. It contains upward of 1,200 islands. Its east end is closed by Stockholm, where its waters are poured into the Baltic by various channels, the difference of level being about six feet. It is surrounded by the populous districts of Stockholm, Nykiöping, Upsal, and Westeras, and the shores are varied with bays and hills, woods, lawns, and cliffs, and are adorned with many castles, country-seats, and villas, including the royal palaces of Drottningholm and Griepsholm.

Malaria, an infectious disease due to animal parasites, and which is characterized by intermittent attacks of chills and fever, so-called intermittent fever, or a continued fever with remissions; or by a chronic malarial cachexia. Malaria is a disease which is very widely distributed. It is found throughout Europe, particularly in the more southerly regions, Italy and Spain, but is absent in the more northerly parts of the Continent, where the temperature prohibits the development of the mosquito, the chief carrier of the disease. In Asiatic countries, particularly in India, malaria is very frequent; and in Africa different types of malarial fever con-

MALARIA

stitute a feature most obnoxious to colonization. In the United States, particularly in the Southern States, malaria prevails. Along the New England coast, where it at one time was very common, it has become much diminished in prevalence and in severity. The Pacific coast region is free from the disease, and the North-west States are comparatively free. In the region of the Saint Lawrence River malaria is unknown.

In order to understand clearly the different forms of malarial fever, it is important to bear in mind that the different types are due to minute animal parasites which enter the blood, usually by the bite of one of a particular genus of mosquitoes (*Anopheles*). (See MOSQUITOES AND THE PROPAGATION OF DISEASE.) The parasite develops after its introduction into the blood and, according to the individual type that is introduced, certain variations in the developmental history of the disease result. The parasites themselves, which are thought to be low forms of animal life, protozoa, develop, for the most part, in the red blood-corpuscles, and have many allies in the red blood-corpuscles of other animals, as frogs, fish, birds, monkeys, cats, etc.

These organisms were first clearly demonstrated by Laveran, a French army surgeon, in 1880, and his early observations were enlarged and amended by Golgi, Marchiafava and Celli, Manson and Ross, and a host of others. At the present time at least three forms of the parasite *Haematozoa malariae* are known, the parasite of tertian fever, the parasite of quartan fever and the parasite of æstivo-autumnal fever. These parasites have two cycles of development, one taking place in the body of man, and the other in the body of the mosquito. Thus a patient with malarial fever infects a mosquito with a parasite which undergoes certain transformations within the body of the mosquito, and is then in turn introduced into the body of another patient, to cause typical attacks of fever according to the type of parasite introduced. Occasionally two different parasites are introduced into the patient's body, and a mixture, of the two forms of the disease results.

The commonest form of malarial fever (the so-called chills and fever, or ague) is due to the tertian and quartan parasites. In these, after an unknown period of incubation, probably from 36 hours to 15 days, the patient has a feeling as though he were going to be sick, sometimes with headache, sometimes a feeling of lassitude and a desire to yawn and to stretch. Occasionally the patient has nausea and vomiting. At the same time the temperature has begun to rise and a chill commences. He begins to shiver, the face becomes drawn, thin, and cold, the body shakes, the teeth chatter, and the skin may be cold and blue, although the internal temperature is known to be gradually rising. After from 10 to 15 minutes, or perhaps a longer time, the chill is followed by a hot stage. The coldness of the surface disappears, and the face becomes congested and flushed, the skin is red, the pulse is full, and the patient may have a throbbing headache, with mental excitement. Thirst is excessive. Then the period of sweating begins, the whole body being covered with perspiration; the temperature drops, the headache disappears, and in an hour or two the paroxysm is over.

A number of variations from this typical form are known. In the tertian type of fever the chill and fever usually occur every other day. This is due to the fact that the cycle of development of the tertian parasite is about 48 hours and that the stage of full development of the parasite, or sporulation, which is more or less coincident with the attack, occurs at these times. Thus every third day the patient has an attack, hence the term "tertian." In the mixed infections, when two sets of parasites develop on alternate days, the paroxysms of chills, fever, and sweating may occur every day. In the quartan type of fever the cycle of development of the parasite is completed every fourth day. Mixed infections also occur in this form of the disease. In the northern United States these are the types of malaria which are more common, but below Mason and Dixon's line a much severer form of the disease is present. This is the æstivo-autumnal type, which gives rise to the so-called bilious remittent fevers and typho-malarial fevers of the South. In these the symptoms are extremely irregular. The paroxysms occur every 24 or 48 hours, and longer remissions are known. The length of the paroxysms is usually longer, lasting 20 hours, instead of 10 or 12 as in the tertian form; the onset of the disease is usually slow and gradual; and there may be no chill. Occasionally there is a continuous fever without much break, the temperature ranging from 102° to 103° F. Jaundice is not infrequent, and this, with the fever and a furred tongue and mental disturbance, often gives rise to the suspicion of typhoid fever. In the simpler types the patient may get well after ten days or two weeks without any special medication. The more severe forms may be fatal unless prompt diagnosis and medication are instituted. The diagnosis of malaria should always include an examination of the blood and the demonstration of the parasite. In the vast majority of untreated cases the parasite can be found. Occasionally, however, repeated examination fails to show it.

Treatment should be prophylactic as well as actual, and attention should be paid to the avoidance of infection no less than to care of the disease itself. Rigid protection of houses by means of screens to keep out the *Anopheles* is one of the most important procedures. Furthermore, it is highly essential that the mosquitoes themselves should be protected from the infection by screening all patients suffering from malarial fever. In order to do this the patient's couch should be surrounded by mosquito-netting, and all mosquitoes in the room of the malarial patient should be killed by means of pyrethrum-powder. Further measures for destroying malaria should be taken by draining off swamps and employing proper engineering methods in order to get rid of the mosquitoes themselves. The planting of swamps with leafy trees often dries them up, and thus prevents the formation of breeding places for mosquitoes. Finally the specific, quinine, should be used in all cases. It is a prompt and sure parasiticide, and in its varied forms can be used by almost every patient, despite individual idiosyncrasies.

In the consideration of some of the chronic forms of the disease a number of perplexing conditions are met. Thus, following constant exposure to malaria and repeated attacks of the disease, symptoms of anæmia, of breathless-

MALARIAL FEVER—MALAYS

ness, swelling of the feet and ankles, bleeding in different parts of the body and enlarged spleen may be found. This is a type of infection known as malarial cachexia. It is found in southern countries, and should be distinguished from the cachexia due to various forms of intestinal parasites. See MOSQUITO; MIASMA; MICROSCOPY, CLINICAL.

SMITH ELY JELLIFFE, M.D.

Malarial Fever. See MALARIA.

Malauac, ma-low'ek, a provincial language, used largely in commerce, in Luzon, Philippine Islands (q.v.).

Malay (mā-lā') **Archipelago**, also called the **INDIAN, ASIATIC or EASTERN ARCHIPELAGO**, and **EAST INDIA ISLANDS**, is the greatest group of islands, numerically and in extent, in the world. They are situated to the southeast of Asia between that continent and Australia, and extend between the meridians of 95° and 135° east, and the parallels of 11° south and 17° north, with the Indian Ocean on the west and the Pacific Ocean on the east. The archipelago is composed of the Sunda or Dutch East India Islands, Sumatra, Java, Flores, Timor, and the numerous adjacent smaller islands; Borneo, Celebes, the Molucca or Spice Islands and their several minor neighbors; and extending to the north includes the Philippine and Sulu Islands belonging to the United States. New Guinea was formerly included in the archipelago, but more properly belongs to Australasia. See separate articles on the various islands. Consult: Wallace, 'The Malay Archipelago' (1880).

Malay Peninsula. See STRAITS SETTLEMENTS.

Malay'an Bear, or **Sun Bear**, a small bear (*Ursus malayanus*), found in the Malayan Archipelago, Borneo, Sumatra, and Java. It is about 4½ feet in length; the fur is black, fading into brown on the nose which is remarkably broad and blunt. The chest bears a crescentic white mark, or, in the Bornean variety, an orange-colored, heart-shaped patch. It usually feeds on grains and fruits, and is very fond of honey, but occasionally indulges in animal food; and is said to attack man, when hard pressed.

Malayan Subregion, a faunal division of the Oriental Region, composed of the southern end of the Malay Peninsula and all the islands of the Malay Archipelago as far as the Philippines and to the Straits of Macassar, where this district is separated from the Australian and Papuan subregions by Wallace's line (q.v.). See ZOOGEOGRAPHY.

Malays', a race of people inhabiting the Malay Peninsula and the Malay Archipelago, and claiming to have their native country in the highlands of Sumatra. The civilization of India appears to have extended itself to the Malays at an early date. In the 13th century the Malays were on the Peninsula of Malacca, where they built a city of the same name, and founded an empire. Their sultans had subdued Sumatra previously to their settling in Malacca. They afterward possessed themselves of the rest of the Sunda Isles, of the Philippines, the Moluccas, and some of the Australian groups, where Malay tribes are found resembling, in their features, religion, and government, the Malays of Malacca. At that time they acted a splendid part in Asia; they carried on commerce, in part

with their own ships, and planted colonies. Great numbers of ships from China, Cochinchina, Hindustan, and Siam filled the harbors of Malacca. They are now divided into distinct tribes, without any general head. This is partly owing to the superiority which the Europeans, particularly the Dutch, have obtained in the Indian seas, and partly to the feudal system of the Malays, by which the national power has been divided and a common spirit prevented by the increasing power of the vassals. The civilized Malays profess the Mohammedan religion. Besides the Koran, the Malays have various local laws. They are fierce and warlike, always bearing arms, and much addicted to the use of force, treacherous in their alliances, and addicted to piracy. The Malay language is widely used as the language of commerce throughout the South Seas and in the islands south of the Philippines. The Malays have long pursued a piratical career, darting from hidden streams in their well-manned proas on any vessel that approached too near the coast, or more boldly lying in wait in fleets in the open sea, for any expected rich prize. Physically considered, the Malays are of low stature, slight in figure, and with very small wrists and ankles. The face is round, the eyes black and somewhat almond-shaped, the nose short and small, cheek bones prominent, features flat, the hair straight and black, the complexion yellowish. In various respects they bear a close resemblance to the Mongolians of Eastern Asia, but differ from them radically in language, all their dialects belonging to a distinct Malayo-Polynesian family which is widely distributed throughout the Indian and Pacific oceans. Of late years the lessons taught them by European and American war vessels have forced the Malays to desist from piracy, their old lawless, roving habits being largely abandoned for the more settled occupations of trade and agriculture. Among the many Malay tribes are the Sakais, or tree-dwellers, who build their houses in forked trees, eight to twelve feet above the ground, reached by bamboo ladders, which are hoisted at will. The tree-dwellers are armed with long blow-guns shooting poisoned arrows. The bamboo furnishes most of their articles of ornament and utility. The blow-gun is a bamboo about an inch and a half in diameter and six and a half feet in length. The bore, drilled most accurately, is a quarter of an inch, and the darts nine inches in length, about the circumference of a heavy darning-needle, sharpened at one end and poisoned. With these they secure all the meat they eat in the jungle,—birds, monkeys, snakes, and lizards. They also have knives made of bamboo.

The Malay intellect is of a low order, and the race has never developed a native culture, their civilization being entirely due to foreign influences, chiefly Hindu and Arab. The Malay language, which is soft and harmonious and of simple structure, is written in the Arabic character, which is ill suited for the purpose. Lately the Roman system has been largely adopted, especially in the Dutch and English dependencies. The literature, which is copious, comprises poetical compositions, such as rhyming-proverbs, love-songs, and dramas displaying some originality, but little imagination. The prose writings are mostly based on Arab or Persian models. Consult Crawford, 'History of the Indian Archipelago'; Logan, 'Journal of

the Indian Archipelago and East Asia, and Ethnology of the Indian Archipelago'; Wallace, 'The Malay Archipelago.'

Malbaie, Canada. See MURRAY BAY.

Malbone, mál-bôn', **Edward Greene**, American painter: b. Newport, R. I., August 1777; d. Savannah, Ga., 7 May 1807. As a boy he was in the habit of frequenting the theatre at Newport to watch the painting of the scenes. At that early age he executed an entire scene, a landscape for the stage, the success of which encouraged him to devote his attention exclusively to painting. At 17 he established himself in Providence as a portrait painter. Meeting with success, he removed in 1796 to Boston, and during the next four years pursued his art in various cities. In 1800 he accompanied Washington Allston (q.v.) to Charleston, and in the succeeding year the two young artists sailed for Europe. Malbone when in London was urged by Benjamin West to take up his permanent residence there with the prospect of ample professional employment; but he returned to Charleston in December 1801. For several years he painted miniatures in the chief cities of the United States with great reputation. His principal imaginative work is 'The Hours,' in which the divisions of the day are personified by female figures.

Malbrouk, mál-brúk', a yellowish, grizzled monkey of West Africa (*Cercopithecus cynosurus*), distinguished from other species of the genus (called guenons) by its wide flesh-colored face with a band across the forehead, the bristly whiskers and ventral parts white.

Malcolm, mál'kóm or má'kóm, the name of four Scottish kings: MALCOLM I., reigned from 943 to 954, and during this period occurred the cession of Cumbria to the Scots by Edmund I., the English sovereign. MALCOLM II. (d. Glams 1034), succeeded Kenneth II. in 1005 and in his reign Lothian and Strathclyde were secured to Scotland. MALCOLM III., surnamed Canmore (Great Head); b. about 1024; d. near Alnwick, Northumberland, 13 Nov. 1093. After the murder of his father, Duncan, by Macbeth, he was assisted by Siward of Northumbria, and Edward, the Confessor. After the death of Macbeth he was crowned at Scone in 1058. In 1068 he granted asylum to Edgar Atheling, his mother, and two sisters (one of whom, Margaret, he married in 1070), with a number of Saxon exiles. His reign, though largely concerned in warring with England, had nevertheless an important bearing on the civilization and consolidation of Scotland. MALCOLM IV. (the Maiden), d. Jedburgh 9 Dec. 1165, succeeded his grandfather, David I., in 1153. He suppressed two rebellions in his realm, and surrendered Northumberland and Cumberland to Henry II. in 1157.

Malcolm, Sir John, British soldier and diplomatist: b. Burnfoot, Dumfriesshire 2 May 1769; d. Windsor, England, 31 May 1833. He entered in 1782 the service of the East India Company, in 1797 was made captain, and till 1799 was engaged in various important services, terminating at the fall of Seringapatam. He was three times ambassador to Persia, and in 1822 was made major-general, and received a grant of £1,000 per year from the East India Company. He was governor of Bombay, 1827-31, when he finally returned to Britain.

He was knighted in 1812. His principal works are: 'A Sketch of the Sikhs'; 'The History of Persia' (1815); 'Sketches of Persia'; 'A Memoir of Central India'; a treatise on the Administration of British India (1823); 'Life of Lord Clive' (1836). Consult Kaye, 'Life and Correspondence of Major-General Sir John Malcolm' (1856-7).

Malczewski, mál-chév'ské, **Antoni**, Polish poet: b. Warsaw, Poland, 3 June 1793; d. there 2 May 1826. He entered the Polish army in 1811, but resigned in 1816 and traveled on the continent, where he met Byron. He settled in Warsaw and there wrote 'Marja' (1825), an epic poem which after his death was recognized as a literary work of great merit, and has since been translated into several languages. None of his work brought him fame or recognition during his life, and he died in wretched poverty. A tomb 'To the author of Marja' was erected in Varsovia.

Malden, mál'dén, Mass., city, in Middlesex County; on the Malden River, and on the Boston & Maine railroad; about four miles north of Boston. It is connected by electrical railway with Boston, Lowell, Haverhill, Lynn, Salem, and a number of other cities and towns. Malden includes several villages.

The first settlement was made in 1641, but the place remained a part of Charlestown until 1649, when it was made a separate, incorporated municipality. It was chartered as a city in 1881. It is a manufacturing city, having over 630 manufacturing establishments, representing nearly 50 different industries. The chief products are rubber boots and shoes, boot and shoe lasts, and boot-trees, wire cord, leather, sand and emery paper, cotton goods, fibre goods, hosiery and hosiery supporters, knit goods, furniture, soap, and picture molding. The manufactories have a combined capital of nearly \$8,000,000, and the annual output is nearly \$17,000,000. The number of employees is about 5,000. The municipal expenditures are annually about \$602,000; the principal items of which are for schools, \$155,000; for waterworks, \$45,000; for charities, \$40,000; for fire department, \$35,000; police, \$30,000; for municipal lighting, \$30,000. The Metropolitan District water system supplies water to the city, also to Melrose and Medford. Malden has excellent public and parish schools, a number of fine church buildings, a Y. M. C. A. building, four libraries, which contain about 33,000 volumes, a Home for the Aged, and a city hospital. The Converse Library building, designed by Richardson, is beautiful and commodious. The government is vested in a mayor and a council. The executive appoints, subject to the approval of the council, the administrative officials. Pop. (1890) 23,031; (1900) 33,664.

Maldivé mal'div' Islands (Thousand Isles), Indian Ocean, a chain of islands at the entrance to the Arabian Sea, 500 miles west of Ceylon, extending from lat. 0° 40' S. to 7° 6' N., nearly on the meridian of 73° 30' E., with a breadth of about 50 miles. The chain is composed of 17 coral atolls (see ATOLL), the larger islands richly clothed with wood, chiefly palm, fertile in fruit, and in various kinds of edible roots. They also produce millet, and abound in coconuts, fowls, and all descriptions of fish. The inhabitants are a civilized race of

people of mixed Singhalese and Arab extraction, Mohammedans and speaking a dialect closely allied to the Ceylonese. They carry on a considerable trade with Bengal, Ceylon, and the Malabar coast, as also to the Red Sea and to Sumatra; exchanging cowries, which are plentiful in the Maldives, coir, mats, oil, fish, tortoise-shell, etc., for rice, sugar, tobacco, and manufactured goods. They are expert navigators and sailors, and have schools for teaching navigation on some of the islands; and they make and repair nautical instruments. They are governed by a sultan, whose title and rank are hereditary; he resides in the island of Mali and pays annual tribute to the British government in Ceylon. Pop. about 30,000.

Malebranche, Nicholas, French philosopher: b. Paris 6 Aug. 1638; d. there 13 Oct. 1715. He studied philosophy in the Collège de la Marche, theology in the Sorbonne and entered the congregation of the Oratorians in 1660. In the history of French metaphysical speculation he ranks second only to Descartes, the greatest of French thinkers, and in 1699 was made member of the Academy of Sciences. He was induced to give many years' study to the Cartesian philosophy by the perusal in 1664 of the treatise 'De Homine' by Descartes, and the fruit of his investigations appeared in his brilliant and original works, 'De la Recherche de la Vérité' (1674), and 'Traité de l'Imagination.' The essence of his philosophy is a sort of mystical idealism. According to him, we have cognizance of things, as well objective realities, as subjective thoughts and feelings, through the idea which resides in our souls; but this idea is in God, so that we perceive everything in God (*vision en Dieu*) as the primal cause of all existences and things. Hence the famous doctrine of 'Occasionalism' or 'Interference,' in accordance with which the objective thing and the subjective impression are made on every occasion to coincide, by the direct interposition of God, in whom alone we think and feel. In the history of philosophy Malebranche may be styled the connecting link between Descartes and Spinoza, the difference between his philosophy and that of the pantheist Spinoza consisting in the fact that to him the Universe was in God, and to Spinoza God was, in fact, in the Universe. Among his other works are to be mentioned 'Conversations Chrétiennes' (1676); 'Traité de la Nature et de la Grace' (1680); 'Traité de la Morale' (1684); 'Entretiens sur la Métaphysique et la Religion' (1688); 'Entretiens d'un Philosophe Chrétien et d'un Philosophe Chinois sur l'Existence et la Nature de Dieu' (1708). Consult: Blampignon, 'Etude sur Malebranche' (1861); Ollé-Laprune, 'La Philosophie de Malebranche' (1870); André, 'La Vie du Révérend Père Malebranche' (1886); Farny, 'Etude sur la Morale de Malebranche' (1886).

Malesherbes, Chrétien Guillaume de La-moignon de, krā-tē-ān gē-yōm dē là-moin-ōn dē māl-sēs-ārb, French statesman: b. Paris 6 Dec. 1721; d. there 22 April 1794. He was educated at the Jesuits' College, entered the legal profession and in 1745 became counsellor of the Parliament of France; in 1750 he was president of the Court of Aids. He was broad-minded

and liberal in his policy, favoring the publication of the 'Encyclopédie' and owing to his protestation against different measures of Louis XV. was removed from office. Under Louis XVI. he was minister of the interior, but resigned in 1776 and until the Revolution spent his time upon his estates and in travel, with the exception of 1787-8, when he was again minister. At the outbreak of the Revolution he came loyally to the assistance of Louis XVI. and was leading counsel in his defense. He remained with the monarch until almost the last and 11 months later was guillotined for treason. He was the author of essays and pamphlets on financial questions, etc.

Malet, Claude François de, klōd frān-swā dē mā-lā, French conspirator: b. Dôle, Franche-Comté, France, 28 June 1754; d. Paris 29 Oct. 1812. He entered the army in 1771 and became a brigadier-general in 1799. Suspected of conspiracy against Napoleon, he was dismissed from the army in 1807 and confined in La Force. While there he laid new plots and was thenceforward confined in a state prison from 1808 till 1812. During Napoleon's campaign in Russia Malet made his escape from prison on the night of 22-3 October, and by circulating the false news of Napoleon's death won over some of the National Guards. While the latter secured the principal public offices in his name, Malet liberated his fellow conspirators, Generals Guidal and Lahorie, from prison. He was, however, himself taken prisoner by La-borde, chief of the military police of Paris, and was shot with his fellow conspirators.

Malet, Lucas. See HARRISON, MARY SAINT LEGER.

Malherbe, François de, frān-swā dē māl-ārb, French poet: b. Caen, France, 1555; d. Paris 16 Oct. 1628. He was educated in Heidelberg and was engaged in the wars of the League. In 1605 he became court poet under Henry IV., but his work as a critic was of greater value than his poetry, which was lacking in poetic feeling and originality, though metrically perfect. He was the founder of the French school of classicism and must be credited with arousing a critical sense among the thinkers of France. His works consist of translations from the Latin and one volume of original verse. Consult: Allais, 'Malherbe et la Poésie française à la fin du XVI. Siècle' (1892); Brunot, 'La Doctrine de Malherbe' (1891).

Malibran, Maria Felicità, mezzo-soprano singer: b. Paris 1808; d. Manchester, England, 1836. She was early trained for the operatic stage by her father Manuel Garcia (q.v.), the Spanish tenor, and made her debut in London (1825). She had lived in that city since 1817 as a teacher of singing, and her success in Rossini's 'Barber of Seville' was such that she was induced to follow her father to New York, where he had an engagement to establish grand opera. Here she married a French merchant named Malibran. She returned to the stage on her husband's failure in business, and in the spring of 1828 appeared on the Parisian boards in Rossini's 'Semiramis.' She subsequently was welcomed with great enthusiasm in London, Naples, Vienna, Milan, and Venice, and traveled with the violinist de Bériot, whom she married shortly before her early death. She was a great actress as well as a marvellous songstress, and

the irresistible charm of her person, added to the generosity of her mind and disposition, made her during her brief career one of the most fascinating operatic singers that had ever won the applause of the European public. In 1838 a statue was erected to her in Brussels, which had been her last place of residence. Consult: Nathan, 'Life of Madame Maria Malibran de Bériot' (1846).

Malic Acid, an organic acid discovered in 1785 by Scheele, and now known to be widely diffused throughout the vegetable kingdom, occurring sometimes in the free state, and sometimes in the form of its potassium, magnesium, or calcium salts. It occurs abundantly, for example, in the gooseberry, cherry, strawberry, and barberry, and also in unripe apples, from which latter fact it derives its name (Latin *malum*, an apple). It may be conveniently prepared by boiling the juice of mountain ashberries with enough milk of lime to almost neutralize it, and pouring the precipitate into boiling dilute nitric acid. Acid malate of calcium crystallizes from the nitric acid upon cooling, and this is dissolved in water, and precipitated by acetate of lead, the lead malate that is thrown down being subsequently decomposed by sulphuretted hydrogen gas. Malic acid has the formula $C_4H_5O_6$, or $C_4H_3(OH)(COOH)_3$, is dibasic, and can be obtained in the form of colorless prisms or needles, which are hygroscopic, and dissolve readily in water and in alcohol. Malic acid kills algæ, and when present in a solution in any considerable amount it prevents the precipitation of cupric and ferric salts by the alkalies. With bases it forms compounds known as "malates," which are mostly soluble.

Malice, in law, a premeditated or formed design to do mischief or injury to another, called also "malice prepense" or "aforethought." Blackstone says that malice prepense is not so properly spite or malevolence to the deceased in particular, as any evil design in general; the dictate of a wicked, depraved, and malignant heart; and it may be either express or implied in law. Express malice is when one, with a sedate deliberate mind and formed design, doth kill another. In many cases where no malice is expressed, the law will imply it; as where a man wilfully poisons another; in such a deliberate act the law presumes malice, though no particular enmity can be proved.

Malicious Mischief, in law any injury done to the person or property of another with deliberate malice. This is an indictable offense both in Great Britain and the United States. The comprehensive English Black Act (so-called from its preamble that "several ill-designing and disorderly persons have of late associated themselves under the name of blacks") with others of a like kind were in 1861 codified (24 and 25 Vic., ch. 97) into an act which extends malicious mischief to buildings, fish ponds and other real estate, as well as to most classes of personal property. To constitute this offense, real not merely legal malice must be proved, such as is defined by Blackstone, "a spirit of wanton cruelty or black and diabolical revenge"; or, as defined by the supreme court of Massachusetts, "a spirit of cruelty, hostility or revenge." This spirit must be cherished by the offender not against a third party, but against the party whose person or property has been injured. Some States of

the Union make secrecy a necessary element in the offense, others generalize the offense as implying merely the infliction of unlawful injury. If the injury was inflicted in the discharge of official duty, or under an honest sense of justification, this is sufficient defense to secure acquittal. The offense may be either a misdemeanor (q.v.) or a felony (q.v.) according to its circumstances. Consult: McClain, 'Treatise on Criminal Law, as Now Administered in the United States' (1897); and Harris, 'Principles of the Criminal Law.'

Malicious Prosecution, prosecution of a person unsuccessfully, maliciously and without cause. To constitute this offense it must be proved (1) That the prosecution averred to be malicious was instituted by the defendant named. (2) That it was decided against prosecutor. (3) That the suit was without probable cause. (4) That the motive was malice. (5) That the plaintiff was injured by such malicious prosecution.

Quod facit per alium facit per se is fully applicable to the defendant in a suit for malicious prosecution; hence a corporation may be liable though they acted through their agent. (See TORT.) Consult: Newell, 'Malicious Prosecution, False Imprisonment, and Abuse of Process' (1892).

Maligi, mā-lē-hē', Philippines, an island lying southeast of Talim Island in the Bay Lagoon (q.v.); it is the seat of the United States military prisons.

Malig'nant Pustule. See ANTHRAX.

Malig'nants, in English history, a name applied in 1643 by members of Parliament to designate those whom they considered to be the evil advisers of Charles I. Afterward the name was extended to all who sided with the king against the Parliament.

Malinao, mā-lē'now, Philippines, (1) a pueblo of the province of Albay, Luzon, situated on the Lagonoy Gulf, 18 miles north by west of Albay, the provincial capital, and three miles north of Tabaco. It is on the main road, and is the shipping point for the large hemp product of the surrounding region. Pop. 11,800. (2) A pueblo and military station of the province of Capiz, Panay, on the Akdón River, 6 miles from its mouth, 30 miles west of Capiz. Pop. 5,800.

Malines, mā-lēn. See MECHLIN.

Malingering, mā-ling'gar-ing, a term denoting feigning disease on the part of a soldier, sailor, prisoner, etc., in order to obtain discharge from service, or escape from duty or labor. It implies some overt act, such as the previous application of a ligature, or the taking of some drug, which produced the appearance of the disease said to exist. A worse form of the same crime, "wilfully maiming," is erroneously called malingering.

Mall, māl or mēl, **The**, (1) a promenade in Central Park, New York, regarded as one of the most successful landscape effects in this country. (2) An avenue in London, on the north of Saint James Park.

Mallalieu, māl-la-lū', Willard Francis, American Methodist bishop: b. Sutton, Mass., 11 Dec. 1828. He was graduated from Wesleyan University in 1857 and became a Methodist Episcopal clergyman in 1858. He has held many important charges and in 1872, 1876, 1880,

and 1884 was a member of the general conferences. He was presiding elder of the district of Boston in 1882-4 and in 1884 was elected bishop.

Mallard. See DUCK.

Mallarmé, Stéphane, stā-fān māl-ār-mā, French poet; b. Paris March 1842; d. there 9 Sept. 1898. Most of his life was passed as an instructor in English at the Lycée Fontanes of Paris. He is known as the founder of the curious poetic school of the "Décadents," in whose organ, 'Le Décadent,' as well as in 'Le Parnasse Contemporain,' he published much. Incomprehensibility appears to have been the object of his study, and he entirely attained it in his preface to an edition (1880) of Beckford's 'Vathek.' Others of his works are 'L'Après-Midi d'un Faune' (1876); 'Petite Mythologie' (1878); 'Les Dieux antiques' (1880); 'Poésies' (1887), a translation of Poe's poems (1888), perhaps his most satisfactory performance; and 'Vers et Prose' (1893).

Mal'leabil'ity, in metallurgy, the property of extending under the blow of a hammer. For every metal there is a temperature of greatest malleability. The following is the order of malleability of the metals: Gold, silver, copper, platinum, iron, aluminum, tin, zinc, lead.

Mal'leable Glass. See GLASS, MALLEABLE.

Malleco, māl-yā'kō, Chile, a province bounded by Argentina, Cautin, Bio-bio, and Arauco. It has an area of 2,857 square miles. The capital city is Angol. The province is mountainous and well wooded in the eastern and western parts. About one half of the population is composed of Indians of the Arauco tribe. Wheat is the staple agricultural product of the country. A portion of the province is traversed by two railway lines running north and south. Pop. (1885) 59,492; (1895) 97,320; (1902) 102,400.

Mal'lee-bird, or **Maleo**, a name for the Australian mound-bird (q.v.), derived from a native language.

Mallery, Garrick, American ethnologist; b. Wilkesbarre, Pa., 23 April 1831; d. Washington, D. C., 24 Oct. 1894. He was graduated from Yale College in 1850 and was admitted to the bar in 1853; he practised law in Philadelphia until 1861, when he enlisted and served through the war in the Federal army, attaining the rank of lieutenant-colonel. He was executive officer of the Signal Service Bureau until 1876, when he was engaged in a geological survey in Dakota, and in 1879 was retired from the army and appointed chief of the bureau of ethnology. Among his books are: 'A Calendar of the Dakota Nation' (1877); 'Israelite and Indian, a Parallel in Planes of Culture' (1889); 'Greeting by Gesture' (1891); 'Picture Writing of the American Indians' (1893); etc.

Malleson, George Bruce, English historical writer; b. London 8 May 1825; d. there 28 Feb. 1898. He was educated at Winchester College, and from 1842 till 1877 served in India, at first in the army, and subsequently in government posts. His chief work, his 'History of the Indian Mutiny' (1878-80), which commenced where the 2d volume of Kaye's 'Sepoy War' left off, and in 1890 there appeared a joint edition of the two histories in six volumes, the 3d volume of Kaye's work being omitted and a

new 6th one added. Other works by him are: 'The Mutiny of the Bengal Army' (1857); 'History of the French in India' (1868); 'Studies from Genoese History' (1875); 'Historical Sketch of the Native States of India' (1875); 'Final French Struggles in India and Indian Seas' (1878); 'History of Afghanistan' (1879); 'The Decisive Battles of India' (1883); 'The Battlefields of Germany' (1884); 'Ambushes and Surprises' (1885); 'The Indian Mutiny of 1857' (1890); and 'Refounding of the German Empire' (1892); lives of 'Clive' (1882), 'Marshal Loudon' (1884), 'Eugene of Savoy' (1888), 'Prince Metternich' (1888), 'Wellesley' (1888), 'Dupleix' (1890), 'Akbar' (1890), 'Warren Hastings' (1894), and 'Lakes and Rivers of Austria, Bavaria, and Hungary' (1897).

Mal'let, John William, American chemist; b. Dublin, Ireland, 10 Oct. 1832. He was educated at Trinity College, Dublin, and at Göttingen, and emigrating to the United States in 1853 became assistant professor in chemistry at Amherst 1854-6 and later chemist to the United States geological survey of Alabama. In 1856-60 he was professor of chemistry at the University of Alabama. He entered the service of the Confederacy and was paroled in 1865 as lieutenant-colonel of artillery. The chair of sciences at the University of Louisiana was occupied by him in 1865-8 and since 1868 he has been professor of chemistry in the University of Virginia. He has contributed valuable scientific articles to the leading chemical periodicals.

Mallet, a wooden hammer used in carpentry and also in the game of croquet (q.v.). The gavel (q.v.) is a variety of mallet. Various small mallets are used by gold beaters, jewelers, dentists and other artisans.

Mallian, mā-yān', Julien de, West Indian dramatist; b. Le Moule, Guadeloupe, 1805; d. Paris, France, 1851. He gained wide reputation as a writer of comedies and dramas, many of which have been presented on the metropolitan stage. The most popular are: 'Two Roses' (1831), a historical drama of the civil wars in England; 'The Carpenter' (1831), a comedy; and 'The Wandering Jew' (1834).

Mallock, William Hurrell, English author; b. Devonshire 1849. He was graduated from Balliol College, Oxford, and won the Newdegate prize in 1872. He has never entered a profession but has devoted himself entirely to literary work. His philosophical and sociological writings include: 'Is Life Worth Living?' (1879); 'Social Equality, a Study in a Missing Science' (1882); 'Atheism and the Value of Life' (1884); 'Property and Progress' (1884); 'Labour and the Popular Welfare' (1893); 'Studies of Contemporary Superstition' (1895); 'Classes and Masses' (1896); 'Aristocracy and Evolution' (1898); 'Doctrine and Doctrinal Disruption' (1900); 'Religion as a Credible Doctrine' (1902). He has also written several works of fiction, most of which deal with the same social and religious problems as the above works, including 'The New Republic' (1877), in which he introduces many well-known contemporaries under thin disguises; 'A Romance of the Nineteenth Century' (1881; new edition 1894); 'The Old Order Changes' (1886); 'A Human Document' (1892); 'The Heart of Life' (1895); and 'The Individualist' (1899);

and has published two volumes of verse and a translation of Lucretius' 'On Life and Death' (1878). His philosophical works deal with the fundamentals of religion arguing for supernaturalism and aiming to show that science alone supplies no basis for religious belief; in his political and economic writings he has attacked the radical and socialist theories and tendencies of the age.

Mallophaga, a name used for an extensive and varied assembly of feather-eating and hair-eating bugs, usually called lice. They are very small, oval, delicate, and of swift motion; of light brown color, some with shovel-shaped heads, others with horn-like appendages on the head. One delicate kind vexes the canary, gluing eggs to its feathers and in the cracks of its perch. *Goniocotes* is a large form, a tenth of an inch long, with bristled head and shield-like head, and is one of the pests of domestic fowls. One species, colored with bands of yellow and brown, infests the turkey and the peacock. Another great family, *Liotheidae*, contains species which resemble white ants, and prey upon the feathers of falcons and of wading birds. *Gyropus* infests guinea-pigs, massing thickly about their neck and ears.

Mal'ory, Stephen Russell, American lawyer: b. Trinidad, W. I., 1813; d. Pensacola, Fla., 9 Nov. 1873. His parents removed with him to the United States in 1820, and he was educated in Mobile and in Nazareth, Pa. He studied law and was admitted to the bar in 1839; he was United States Senator 1851-7 and in 1861 entered the service of the Confederate States as secretary of a navy not in existence. He was arrested at the close of the war and held for 10 months, after which he returned to Pensacola and was until his death engaged in law practice.

Mal'ow, a genus of herbs (*Malva*), of the order *Malvaceae*. The species, of which there are less than a score, are widely scattered, and are characterized by angled, lobed or dissected leaves, and solitary, or clustered axillary flowers. They include four species cultivated in America and one very well known weed, *M. rotundifolia*, popularly known among children as "cheese-plant" because of the shape of the fruits, which also suggested another popular name, "shirt-button plant." The plant is a perennial, very persistent of life, and rather difficult to eradicate except by constant clean cultivation. Musk-mallow (*M. moschata*), is cultivated for its large, showy pink or white flowers; *M. alcea* is also popular. *M. crispa* furnishes a useful fibre, as probably other species could be made to do. Its leaves are often used for garnishing but are not eaten. This species and *M. sylvestris* are frequently seen in old gardens and in their vicinity as escaped plants, but are not offered for sale by seedsmen. The name mallow is loosely applied to many species of the mallow family, but not of the genus *Malva*; for instance, marsh-mallow (*Althaea officinalis*), rose-mallow (*Hibiscus moscheutos*), and Indian mallow (*Abutilon avicennae*); also, more loosely still to unrelated plants, as Jew's mallow (*Corchorus olitorius* or *C. capsularis*). See ABUTILON; CORHORUS; HOLLYHOCK; HIBISCUS.

Malmaison, māl-mā-zōn, a celebrated French château on the Seine, 10 miles west of Paris. It was the favorite residence of Josephine,

wife of Napoleon I., and here she died. The château belonged to Richelieu, and was restored in 1861 by Napoleon III. In 1870 a sortie by Ducrot from Paris was repulsed here by the Germans.

Malmesbury, māmz'bēr-i, **James Harris**, 1ST EARL OF, English diplomatist: b. Salisbury, England, 21 April 1746; d. London 20 Nov. 1820. He was educated at Merton College, Oxford, afterward studied at Leyden, and in 1768 became secretary of legation at Madrid. He was ambassador at Berlin 1772, in 1777 at St. Petersburg, and in 1784 at The Hague. In 1788 he was created Baron, in 1800 Earl of Malmesbury and viscount Fitz-Harris. In 1793, with other Whigs, he deserted Fox for Pitt, and in 1795 had married by proxy and conducted to England the Princess Caroline. Consult: 'Daines and Correspondence' (1845); 'Lord Malmesbury and his Friends' (1870). (Both works edited by J. H. Harris, his grandson.)

Malmesbury, William of. See WILLIAM OF MALMESBURY.

Malmignatte, māl-mī-nyāt', a spider. See LATRODECTUS.

Malmö, māl'mé, Sweden, a seaport and the third largest town of the country, on the Sound, almost opposite Copenhagen, 17 miles distant, with which it has steam-ferry communication, a channel being maintained in winter by an ice-breaker. Malmö is a busy industrial centre with important manufactures, is the terminus of several railroads, and is 384 miles by rail southwest of Stockholm. The town and its harbor have been considerably improved and modernized, and an extensive export and import trade is carried on. Malmö dates from the 12th century. Pop. (1900) 60,857.

Malmsey, mām'zī or māl'm'sī, a sweet wine, made from a grape grown on rocky ground, in Madeira, exposed to the full influence of the sun, and not gathered until partially withered.

Malolos, māl-lō'los, Philippines, a pueblo and the capital of the province of Bulacán, Luzon, situated at the head of one of the inlets of the Pampanga River delta, five miles northwest of Bulacán, the former capital. It is a telegraph and military station, is near a station of the Manila Dagupan railroad, and is the centre of an important trade. It is in a region which was a stronghold of the insurgents, and immediately after the close of the Spanish war was made the capital of the insurgent government. Pop. 14,600.

Malone, ma-lōn', **Edmund**, English Shakespearean scholar: b. Dublin 4 Oct. 1741; d. London 25 April 1812. He was educated at Trinity College, Dublin, and was called to the Irish bar in 1767, but henceforth devoted himself entirely to literary pursuits. His most important and permanent critical works are: 'Attempt to Ascertain the Order in Which the Plays of Shakespeare Were Written' (1778), which still carries authority; his edition of the poet in 10 volumes; and the edition known as the Third Variorum, which was prepared after his death by James Boswell, the younger, out of material left by the critic, and published in 21 volumes. This last is still the best of all complete critical editions. He also published: 'Remarks on the Rowley (Chatterton) Con-

MALONE—MALT AND MALTING

troversy'; 'An Inquiry into the Ireland Shakespearian Forgeries'; and biographical memoirs of Sir Joshua Reynolds, Dryden, W. Gerard Hamilton, etc.

Malone, Walter, American verse writer: b. De Soto County, Miss., 10 Feb. 1866. He was graduated at the University of Mississippi, and subsequently engaged in the practice of law and in literary work. He has contributed to the periodicals of the day and has published: 'Claribel, and Other Poems' (1882); 'The Coming of the King,' short stories (1897); 'Songs of the North and South' (1900); etc.

Malone, N. Y., village, county-seat of Franklin County; on the Salmon River, and on the New York C. & H. R. and the Rutland R.R.'s; about 27½ miles north by west of Albany, and 12 miles from the boundary between the United States and Canada. It is situated at the northern foot-hills of the Adirondack Mountains, in an agricultural region, the chief products of which are hops, hay, and potatoes. The dairy products and poultry are important.

The place was named in honor of Edmund Malone (q.v.), an Irish barrister and writer, by his friend, William Constable, who, together with his wife, named many of the places located within the limits of the large tract of land in the northern part of New York known as "The Macomb Purchase." The first settlement was made in 1802, and its first inhabitants were mostly from Vermont and Ireland. In 1820-30 the people began considering the founding of an academy, and a number of the farmers pledged their farms as security for the payment of the debt incurred for the erection of the building, and Franklin Academy was established in 1831. The Northern railroad, now Rutland railroad, entered the town in 1851, and the New York Central in 1892.

Malone figured prominently in the War of 1812; and furnished a large number of soldiers, privates and officers, in the Civil War. The village was the scene of two Fenian (q.v.) gatherings.

The chief manufactures are paper, pulp, flour, lumber, leather, woolen goods, foundry and machine-shop products, sash doors, and blinds, men's clothing, cigars, and dairy products. The electric-light and gas plants and the waterworks are owned by private companies. Malone is the commercial centre for the greater part of Franklin and parts of the adjacent counties, a section having a population of about 50,000. There are two national banks capitalized for \$300,000. The village has six fine churches, a high school building (formerly Franklin Academy), several grammar and primary schools, the county court-house, jail, a State Armory, and several wholesale establishments. The educational institutions, besides the public schools, are a State School for Deaf Mutes, and Saint Joseph's Academy. There are three public libraries, the Wead Library, 7,000 volumes, free to the people of the school district, is housed in a beautiful building donated by Mrs. S. C. Wead; the Wadhams Library, 2,000 volumes, established and maintained by a literary society, free to all the people of the town of Malone (several school districts), and the Franklin County Historical Society library, established in 1902. There is a well-kept park.

the "Village green," formerly the place of drill for the State militia. Malone was the home of William A. Wheeler, vice-president of the United States; John Larkin Thorndike, who built the Oroya and other railroads in Peru, S. A.; Ashbel P. Fitch, later of New York city, and a number of other noted people.

The government is vested in the president and board of trustees of the village under the general laws of the State of New York. The officers besides the president and six trustees are collector, treasurer, and police justice, all chosen by popular election, and the clerk and policemen who are appointed by the board of trustees. Since the Federal census of 1900 an adjoining manufacturing suburb has been incorporated in the village. Pop. (1890) 4,986; (1900) 5,935; (1903) 7,000.

Maloo Climber. See BAUHINIA.

Mal'ory, Sir Thomas, author of the English prose romance 'Morte d'Arthur.' The work was finished in the ninth year of Edward IV.'s reign, 1470, and published by Caxton in black-letter folio, in 1485. Little is known of the author; he may have been a priest; Caxton calls him "a servant of Jesus both day and night," and priests frequently were accorded the title "Sir." Probably he was a Welshman. See ARTHURIAN LEGENDS; MORTE D'ARTHUR; GRAIL, THE HOLY; LANCELOT; MERLIN; TRISTRAM.

Malot, mǎ-lō, Hector, French novelist: b. La Bouille, near Rouen, France, 20 May 1830; d. 18 July 1907. He studied law, but abandoned it for a literary career, and in 1859 issued the first of a long series of successful novels. He was for a time newspaper correspondent in London, and literary critic of 'L'Opinion nationale.' He wrote 'Victimes d'Amour' (1859); 'Sans famille,' published in English as 'No Relations' (1878); 'Conscience' (1888); 'Complices' (1893); an autobiography, 'Le Roman de mes Romans' (1896).

Malpighi, mǎl-pē-gē, Marcello, Italian anatomist: b. Crevalcuore, Italy, 10 March 1628; d. Rome 29 Nov. 1694. He received a medical education in Bologna and was granted a doctor's degree in 1653. In 1656 he became professor of medicine at Pisa, where he formed a friendship with the mathematician Borelli, who encouraged him to proceed with researches in anatomy. His health failing he returned to Bologna and continued his investigations, which resulted in discoveries which established facts undisputed in the modern world of science and placed the world's knowledge of physiology on a new footing; his researches in botany and entomology were highly important. In 1691 he was summoned to Rome as first physician to Innocent XII., in which office he died. He published numerous scientific works of great value, a complete edition of which was published in Venice 1743.

Malplaquet, mǎl-plā-kā, Battle of, the bloodiest in the war of the Spanish Succession, gained by Marlborough and Eugène, the commanders of the allies, against the French under Villars 11 Sept. 1709. The French lost 10,000; the allies more than 20,000.

MALT REFUSE—MALTE-BRUN

Malt Refuse, Malt Sprouts. See NUTRITION OF FARM ANIMALS.

Malta, mál'ta, an island in the Mediterranean, belonging to Great Britain, with its dependencies, Gozo, Comino, and Cominotto, forming the elevated portions of the plateau that extends northward to Sicily, 62 miles, and southward to Africa, 197 miles, and divides the Mediterranean into two basins. The Maltese group has a total area of 117 square miles, of which 95 square miles belong to Malta. Malta is of irregular oval shape, 17 miles long, with a central breadth of 9 miles; its greatest elevation is over 750 feet. It is of limestone formation, and is deeply indented on all sides except the south, where the coast forms a continuous and almost unbroken line. Of great strategical importance, it is very strongly fortified, especially Valetta, the capital, which is the headquarters of the British Mediterranean fleet, and the principal naval and mercantile coaling station in the Mediterranean, importing and exporting annually between 500,000 and 600,000 tons. Malta is also a valuable sanatorium for troops employed in the Orient. The climate is hot in summer and enervating when under the influence of the humid sirocco blowing from Africa, but generally is mild and healthful. There are only a few small streams, but the springs are so numerous and copious that no deficiency of water is felt, and since 1880 an extensive system of waterworks has greatly enhanced sanitary conditions. Malta has a bare, stony appearance, owing to the absence of trees. The soil is thin, but remarkably fertile; and its fertility is increased by the skilful cultivation and the diligent toil of the inhabitants. Large crops of wheat and potatoes are raised, early varieties of the latter being largely exported to England; maize, barley, cotton, clover, oranges, figs, grapes, carob beans, and peaches and other fruits are also grown. Filigree ornaments and a little cotton are manufactured. Sheep and goats are kept, with smaller numbers of cattle, mules, asses, and horses. The language of the people is a corrupt dialect of Arabic, with a strong admixture of Italian and other words; some authorities, however, connect it with the ancient Phœnician. The native population believe themselves to be of Phœnician descent. From the time of the settlement of the Knights of St. John down to quite recently Italian was the official language; but it has been superseded by English. Most of the educated Maltese speak Italian, and some speak English; the peasantry as a rule know neither the one nor the other. The Maltese are a sober, industrious race of people, though often quick-tempered and ignorant. They are proud of their island home—they love to call it "the flower of the world"—and are devout Roman Catholics. Legislation is carried on by 6 official and 14 elected members, the British governor, with the power of veto, being president. There is also an executive council, consisting of the governor as president, seven official members, and three nominated by the governor from among the elected members of the legislative chamber; the crown retains the right to legislate also through orders in council. There is no direct taxation in Malta. The local militia, including the Royal Malta Fencible Artillery, number about 1,200. The population in 1901 was 188,141, including 2,300

British residents, 1,200 foreigners, and from 6,000 to 7,000 imperial troops. Malta has great historical, archaeological, and architectural interest. It passed successively through the hands of Phœnicians, Greeks, and Carthaginians, and was finally attached to Rome during the Second Punic War. Relics of these various occupations exist throughout the island. After the fall of the Roman empire it was seized at different times by Vandals, Goths, and Saracens. From the last it passed to Sicily, and followed its fortunes till 1522, when Charles V. granted it to the order of St. John of Jerusalem, the Knights of St. John of Malta being distinguished during successive centuries for their bold defense of Christianity against Moslem assaults. In 1798 the grand-master surrendered Valetta without defense to Napoleon. Shortly afterward the inhabitants regained it and asked for a British protectorate, which was confirmed in 1814 by the Congress of Vienna. Consult: Ballou, 'The Story of Malta' (1893).

Malta Fever (also MEDITERRANEAN FEVER, NEAPOLITAN FEVER, ROCK FEVER, etc.), a disease occurring near the Mediterranean shores, in which the fever symptoms are accompanied by intense pain, enlargement of the spleen, swelling of the joints, excessive perspiration, and other conditions tending to bring about extreme weakness and loss of functional activity. Its cause is now assigned to *Micrococcus melitensis*. Treatment thus far is not specifically determined. Hygienic care, such as is normal in fevers, with special attention to diet and bathing, together with ordinary applications for reducing swellings, is all that can be recommended.

Malta, Knights of. See KNIGHTS OF MALTA.

Maltbie, mál't'bī, **Milo Roy**, American sociologist: b. Hinckley, Ill., 3 April 1871. He was graduated from Upper Iowa University in 1892 and took the degree of Ph.D. at Columbia in 1897. He was professor of economics and mathematics at Mount Morris College, Ill., in 1893-5, and from 1897-1902 was secretary of the Reform Club Committee on City Affairs, and has devoted himself to the study of municipal questions, going abroad in 1899 to investigate foreign cities and their problems. He was lecturer on municipal government at Columbia University in 1900, and has been editor of 'Municipal Affairs' since 1897. He has written: 'English Local Government of To-Day' (1897); 'Municipal Functions' (1898); and 'Street Railways of Chicago' (1901).

Malte-Brun, mál'tě-bröon (Fr. mál't-brüñ), **Conrad** (properly MALTHE BRUNN), Danish geographer: b. Thisted, Jutland, 12 Aug. 1775; d. Paris 14 Dec. 1826. He devoted himself to literature and politics in Copenhagen, but having given offense by writing in favor of the liberty of the press and the enfranchisement of the peasants, was banished to Sweden in 1796. He went later to Paris, where he became famous as a geographer. He edited the foreign political department of the 'Journal des Débats,' but is best known for his 'Summary of Universal Geography' (8 vols., 1810-29). The first six volumes only were completed by Malte-Brun. Among his other works are: 'Ancient and Modern Poland'; 'History of Travel'; and 'Mathematical, Physical and Political Geography.'

MALTESE CROSS—MALVERN HILL

Maltese (mâl-tēs' or -tēz') **Cross.** See **Cross.**

Maltese Dog. See **Dog.**

Mal'tha, (1) according to Pliny, a name used for an inflammable mud which flowed from a pool at Samosata, Commagene, North Syria, and resembled naphtha. (2) A mixture of wax and pitch for caulking ships; mineral tar is another name for maltha, which is found oozing from rocks in certain localities, particularly in California.

Mal'thus, **Thomas Robert**, English political economist: b. near Dorking, Surrey, 14 Feb. 1766; d. Bath 29 Dec. 1834. He studied theology at Cambridge and was ordained in the Church of England, continuing to pursue his profession as a teacher while holding a small living in Surrey. In 1805 he was appointed professor of history and political economy at Haileybury College. In his famous 'Essay on the Principles of Population' he propounded (1798) what is known as the Malthusian Doctrine, namely that the increase of population advances at a geometrical, the increase of the means of life at an arithmetical ratio: that this condition of things renders the condition of the poor more and more hopeless, that unless famine or war interfere to diminish population the means of life will eventually prove inadequate; that discouragement of early and improvident marriages and the cultivation of self-restraint must be employed to avert the danger. These positions have been the subject of long and widespread discussion. His other writings include: 'Principles of Political Economy' (1826); 'Definitions in Political Economy' (1853). Consult: Bonar, 'Malthus and His Work' (1885); Soetbeer, 'Die Stellung der Sozialisten zur malthusischen Bevölkerungslehre' (1886); Molinari, 'Malthus, Essai sur le Principe de Population' (1889); Cossa, 'Il principio di popolazione di T. R. Malthus' (1895).

Malus, **Etienne Louis**, â-tē-ën loo-ë mâ-lüs, French physicist and military engineer: b. Paris 23 June 1775; d. there 23 Feb. 1812. He was educated at the Ecole Polytechnique, and upon leaving the school received a captain's commission in the corps of engineers, and served during the campaign of 1797 with the army of the Sambre and Meuse. Subsequently he participated in the campaign in Egypt, and in 1804 superintended the construction of fortifications at Antwerp and Strasburg. Whatever time could be spared from his professional labors was devoted to scientific pursuits. His chief publications consist of a mathematical 'Traité d'Optique,' first published in the 'Mémoires présentés à l'Institut' in 1810, in which he promulgated some valuable discoveries respecting the refraction of light in transparent media; and the 'Theory of Double Refraction' (Mémoires présentés à l'Institut, Vol. II.), containing an account of his discoveries respecting the polarization of light, which consisted in showing that light may acquire properties identical with either of two rays yielded by refraction through Iceland spar by the process of simple reflection at a particular angle from any transparent body. This discovery gained for its author his election to the Institute and the biennial medal of the Royal Society of London. He also published an 'Essay on the Measurement of the Refractive Force of Opaque Bodies.'

Malvaceæ, a family of flowering plants, the mallows and their allies, in the order *Columnifera*, with the calyx gamosepalous; petals contorted in the bud, stamens numerous, monadelphous; anthers extrorse, monothecious; pollen-grains spiny. They are herbaceous or woody plants, mucilaginous in their juices, and usually densely hairy, especially when young. The leaves are palmately nerved and frequently deeply five-lobed. The flowers are large, funnel-shaped, conspicuously and beautifully colored, attracting the aid of insects in fertilization. The fruit is schizocarpous. This family contains many important genera and species of plants elsewhere described, such as the mallows (*Malva*, *Lavatera*, etc.), hollyhocks (*Althæa*), cotton-plants (*Gossypium*), the rose-mallows (*Hibiscus*), etc. About 60 genera and 700 species are accredited to this family by systematic botanists.

Malvern, māl'vĕrn, Ark., town, county-seat of Hot Springs County; on the St. Louis, I. M. & S. railroad; about 20 miles southeast of Hot Springs. It is in an agricultural region, in which the principal products are cotton and fruit. The chief manufactures are flour, lumber, and bricks. The trade is principally in lumber, cotton, and fruits. Pop. (1900) 1,582.

Malvern, māl'vĕrn, **Great**, England, a fashionable inland watering-place in Worcestershire, on the east side of the Malvern Hills, at the foot of the Worcestershire Beacon, 1,395 feet high, the summit of which commands magnificent views. A restored 11th century priory church and Malvern College are the chief edifices. Malvern is widely celebrated and greatly frequented owing to its fine climate and the efficacy of its mineral springs. Pop. (1901) 16,400.

Malvern Hill, **Battle of**. After the close of the battle of Glendale (q.v.), 30 June 1862, the Army of the Potomac was put in position on Malvern Hill, an elevated open plateau on the left bank of James River, 60 feet high, and about 1½ miles by ½ mile in area. On this plateau the army was disposed in a large arc, both flanks resting on the river, and protected by gunboats. Porter's Fifth corps was on the left, Couch's division of Keyes' corps on the right of Porter, Heintzelman's two divisions—Kearny and Hooker—on the right of Couch, Sumner's corps on the right of Heintzelman, and Franklin's corps on the right of Sumner. Peck's division of Keyes' corps was on the right of Franklin and was the extreme right of the army, and it and the left of Porter's line stood back to back. There were numerous batteries of artillery along and in rear of the line. The position was a very strong one: the Confederate D. H. Hill says: "Tier after tier of batteries were grimly visible on the plateau rising in the form of an amphitheatre." The approach to the position was over 400 to 500 yards of open ground swept by artillery fire. When it was discovered early in the morning of 1 July that McClellan had fallen back from Glendale during the night, Lee gave orders for immediate pursuit. Jackson marched by the Willis road, and when in sight of Malvern Hill he formed line, with Whiting's division on his left and D. H. Hill's on his right, one of Ewell's brigades occupying the interval. The rest of Ewell's division and Jackson's own division were held in re-

MALVERN HILLS—MAMELUKES

serve. Magruder was directed to take position on Jackson's right, but before his arrival two of Huger's brigades came up and were placed next to Hill. The Confederates felt the Union lines with infantry and artillery, and when Magruder came up, about 2 p.m., Huger's two brigades—Armistead and Wright—with four batteries, were ordered forward. The batteries, as they emerged in succession from the woods, were promptly knocked to pieces by the fire of over 60 guns brought to bear upon them, and the two brigades were repulsed with loss. This attack fell upon the right of Porter and left of Couch, and the latter was now reinforced by Caldwell's brigade of Sumner's corps. No serious advance had been made on other parts of the line, but Hill had suffered severely from artillery fire in getting his troops in position opposite Couch's right. At 5:30 p.m. Magruder assaulted Porter's line and the left of Couch with the five brigades of Armistead, Cobb, Wright, Mahone, and Barksdale. All were met by such a terrific fire of artillery and musketry, which swept the slope of the hill, that they could make no headway, though gaining temporary advantages, and fell back with great loss. Toombs', G. T. Anderson's, and Ransom's brigades were now ordered in; Toombs got lost in the thick woods; Anderson and Ransom shared the fate of those preceding them, and fell back. Magruder's fight ended before dark. While Magruder was thus engaged with Porter and the left of Couch, D. H. Hill, on his left, advanced against Couch's right, which, as the action progressed, was reinforced by Caldwell's brigade, three regiments of Hooker's division, under Sickles, and some of Kearny's division. Hill's five brigades were commanded by Gens. Garland and Ripley, and Cols. J. B. Gordon, A. H. Colquitt, and C. C. Tew. The slope to Couch's line was about 800 yards, without cover, and the advance directly in the face of guns on the slope and bristling on the summit, from which burst forth such a terrific fire of shell and canister that Hill's brigades withered under it. Toombs' brigade was picked up and sent to their support, but the six brigades were hurled back, some in great disorder after the loss of half their men. Later in the evening Taylor's brigade of Ewell's division, on Hill's left, moved against the left of Kearny's division, and was repulsed by artillery fire alone. Half an hour after Hill had been disastrously repulsed and his troops scattered, McLaw's division of two brigades—Semmes and Kershaw—came up and assaulted Porter's right. Semmes made some headway up the slope, but was met by the 69th and 88th New York of Meagher's brigade, which Sumner had sent to Porter's assistance, and was repulsed after a hand-to-hand encounter. Kershaw, on Semmes' left, was likewise repulsed, and his repulse at twilight marked the close of the battle, but it was 9 o'clock before the firing ceased and quiet settled down on the bloody field. Sixteen Confederate brigades had heroically thrown themselves against the Union left, but were repulsed by the artillery and nine brigades. Advanced regiments were forced back, but generally recovered ground; batteries or parts of batteries were withdrawn, but again run forward; yet "never for an instant was the Union line broken or the guns in danger." The Confederate loss was over 5,500; Jackson's four divisions had 2,301 killed, wounded, and missing; Ma-

gruder and Huger about 2,900. The Union loss was less than 2,000. Consult: 'Official Records,' Vol. XI.; Webb, 'The Peninsula'; 'McClellan's Own Story'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Malvern (mál'vèrn) Hills, England, a range of picturesque hills on the borders of Worcester and Hereford shires. It extends north and south for about 9 miles, and attains an altitude of 1,395 feet in the Worcestershire Beacon.

Mälzel, mäl'tsël, **Johann Nepomuk**, German musical artificer: b. Ratisbon 1772; d. at sea 1838. He invented an orchestron, and an automatic trumpeter, and was made court mechanician at Vienna in 1808. He died on his way to visit the United States.

Mama'nuas, mã-mä'noo-äs, a Negrito people of the Philippines living in the interior of Surigdo Peninsula, island of Mindanao. Large numbers of them have been converted to Christianity by the Jesuit missionaries. See PHILIPPINE ISLANDS.

Mamaroneck, mã-mär'õ-nëk, N. Y., town, in Westchester County; on Long Island Sound, and on the New York, N. H. & H. railroad; about 21 miles east of New York. The town includes the village of Larchmont and part of the village of Mamaroneck. It is a residential section, in which many New York city people have homes. There are but few industrial establishments; the principal are the National Machine Company, manufacturing sewing machines and sewing machine attachments, and employing 80 persons; and a gutta-percha plant, in which 50 persons are employed. It is the headquarters of the Larchmont Yacht Club. Pop. (1900) 3,849.

Mamba'jao, mã-mbä'how, a town of the province of Misamis, Mindanao, situated on the northwestern coast of Camigin Island, which lies off the northeast coast of Mindanao. Pop. 18,000.

Mam'ber, a widely diffused colloquial name for the common wild goat (*Capra agagrus*) of southwestern Asia. See GOAT.

Mambu'sao, mã-mboo'sä-õ, Philippines, a pueblo of the province of Cápiz, island of Panay, on the Cápiz River, opposite Ibayaj and 17 miles southwest of Cápiz, the provincial capital. It is a military station. Pop. 11,000.

Mamelukes, mãm'e-lüks, **Mamlouks**, or **Mamalukes** (from the Arabic *mamlūk*, a slave), in Egypt, slaves from the Caucasian countries, who from menial offices were advanced to dignities of state. When Genghis-Khan made himself master of the greatest part of Asia in the 13th century, and carried vast numbers of the inhabitants into slavery, Nedjmeddin (Malek Salah), sultan of Egypt, bought 12,000 of them, including natives of Circassia, but chiefly Turks, from Capchak (Kipzak), had them instructed in the military exercises, and formed a regular corps of them. They soon exhibited a spirit of insubordination and rebellion. Under his successor they interfered in the government, assassinated the sultan, Turan Shah, and in 1254 appointed Ibegh, one of their own number, sultan of Egypt. The dominion of the Mamelukes in

MAMMALIA — MAMMALS

Egypt continued 263 years. During this period they made some important conquests, and in 1291 they drove the Franks entirely out of the East. From the middle of the 18th century the number and wealth of the Mamelukes gave them such a superiority over the Turks in Egypt that the pasha appointed by the Porte was obliged to conform entirely to their wishes. This superiority was owing principally to Ali Bey, who ruled with unlimited power from 1766 to 1773, when he was assassinated. The Mameluke beys, especially Murad Bey, played an important part at the time of the French invasion. The Mamelukes, who were scattered throughout Egypt, and estimated at 10,000 or 12,000 men, maintained their numbers, principally by slaves brought to Cairo from the regions lying between the Black and Caspian seas. These were compelled to embrace the Mohammedan faith, and were all educated as soldiers. After a time they obtained a share in the government, and some of them even became beys, for none but Mamelukes were capable of holding this office. They formed a fine body of cavalry, and attacked the French, when they landed in Egypt, with the greatest fury; but they were unable to withstand the European artillery, and many of them soon joined the French. The Pasha of Egypt, Mehemet Ali, destroyed the Mameluke beys 1 March 1811, by a perfidious stratagem, and immediately afterward ordered a general massacre of the Mamelukes in every province of Egypt. Some hundreds managed to escape into Lower Nubia, where they built a small town, and endeavored to keep up their force by disciplining negroes in their peculiar tactics. They did not succeed, however, and shortly afterward dispersed. See also EGYPT.

Mammalia. See MAMMALS.

Mammals, a class of animals, known also as beasts, or quadrupeds, the highest of the vertebrate group in the sense that it comprises forms whose organization is on the whole the most efficient on account of the complexity, or perfection, of the various organs and parts. The diagnostic character of the class is the possession of cutaneous glands, which secrete a complex fluid, called milk, for the nourishment of the young. The lower jaw articulates directly with the cranium. The occipital condyles, two in number, form part of the exoccipitals. The internal ear contains a series of three or four separate small bones, which are concerned in audition. The heart is four-chambered, with two auricles and two ventricles; a single left aortic arch; blood warm; red blood disks, not nucleated. A muscular diaphragm separates the heart and lungs from the abdominal cavity. With few exceptions, mammals are clothed with hair, a special outgrowth of the epidermis.

Mammals as a class are extremely diversified in size, appearance and habits. The structure of some is modified for a purely aquatic life, of others for burrowing in the earth, for flying, for leaping, for running, etc. Some live entirely in the sea, others pass their lives in the tree-tops, and others in subterranean caverns, which they excavate.

All mammals possess limbs, which are normally four in number, but the hind pair is suppressed in the whales and sea-cows. The limbs assume the form of legs for terrestrial progression, wings for flight, or paddles for swimming.

The class includes man, and the majority of the animals most useful to man, such as the horse, ox, sheep, goat, dog, cat, etc. It includes also the whales, the largest of existing animals. About 600 genera and 5,000 species of mammals (exclusive of fossil forms) are known, of which about 200 genera and 1,200 species occur in North America, north of Panama.

Integuments.—The skin of mammals consists of two principal layers, a superficial one, called the epidermis or cuticle, and a deeper layer, the dermis or corium. The epidermis is again divided into two layers, an external horny layer and a deeper one, called the Malpighian layer. The epidermis is usually quite smooth, and is beset with hairs which are a special outgrowth of this part of the integument peculiar to the class. The cetacea are without hairs, except a few about the mouth. In the pangolins, the epidermis develops large scales which cover the greater part of the body. Epidermic scales of smaller size are found on the tails of various rodents, insectivores, and marsupials. The horns of ruminants, the nasal horn of the rhinoceros, and all claws, nails, and hoofs are also epidermic structures.

The dermis or corium is generally thicker than the epidermis and contains blood-vessels, tactile nerve endings, sweat glands which open on the surface of the body, and fatty tissue. In the whales and seals the fat cells are enormously developed immediately below the dermis and constitute the "blubber." In the armadillos bony plates occur in the dermis, forming a carapace or shell. They are covered by horny sheaths. The presence of small hard tubercles in the skin of certain porpoises gives ground for the belief that the ancestors of the cetacea were covered with a bony armor, somewhat like that of the armadillos.

Hair.—True hairs are found only on mammals. They are simple epidermic structures growing from papillæ sunk in the dermis. They consist of central cellular pith, encased in a horny sheath. In some mammals the sheath is rough, and the hair is then capable of being matted together to form "felt." In the majority of mammals the hairy covering consists of coarse long hairs and fine short hairs intermingled, forming the fur. In the porcupines the coarse hairs assume the form of large stiff spines, or quills; in the hogs they are smaller and more flexible, forming bristles. The hairy covering is usually shed once or twice annually, except the manes and tails of such ungulates as the horse, the hairs of which may persist throughout life.

The majority of mammals have a number of large, long hairs, or vibrissæ, arranged in a definite fashion about the mouth, eyes and ears, which serve to a certain degree as tactile organs. In deer and some other ruminants the hairs consist mainly of the cellular pith and hence are easily broken.

The color of mammals is chiefly due to the pigments contained in the hair, which belong to the class known as melanins. Black, white, and brown in various mixtures and shades are the commonest colors. The coloration is chiefly protective, but some such sharp contrasts of black and white as those of the skunks are thought to be warning colors, and the clear white of the under side of the tail of deer, certain hares, etc., to be directive, or distinguishing, marks for the young.

MAMMALS

Skeleton.—The skeleton consists of an axial portion, comprising the skull, the backbone or vertebral column, the ribs and the sternum; and an appendicular portion, or the skeleton of the limbs. In the skull the bones are bound firmly together by the overlapping or interdigitation of the edges, except the lower jaw, the ossicles of the internal ear and the hyoid, or tongue, bones. In adults most of the sutures are usually obliterated. The snout or rostrum consists of the intermaxillary, maxillary, palatine and pterygoid bones below and on the sides, and the nasals above, while within are the median vomer and the ethmoid bones. The rostrum abuts against the brain-case or cranium, which is vaulted, and comprises three segments, an anterior one, consisting of the presphenoid, orbito-sphenoids and frontal; a middle segment, consisting of the basisphenoid, alisphenoids, squamosals, and parietals; and a posterior segment, consisting of the basi-occipital, exoccipitals and supra-occipital. The exoccipitals bear the two condyles for articulation with the vertebral column. At the base of the skull, between the occipital and squamosal, are the periotic bones, containing the organ of hearing or internal ear, and the tympanics, which form the bony walls of the orifice of the ear. The tympanics are greatly expanded in whales and some other mammals, forming shell-shaped bullæ.

The vertebral column comprises five sections, the cervical, dorsal (or thoracic), lumbar, sacral and caudal. The cervical vertebrae are seven in number in all mammals, whatever the length of the neck, the only exceptions being the manatees, which have six, and the sloths, which have six, eight or nine. In certain whales, the majority of porpoises and some rodents, the cervicals are more or less united; in the right whales they form a single bony mass. The dorsals vary in number from 9 to 22. Articulated with each is a pair of ribs. The ribs terminate below in cartilages, which sometimes ossify, forming what are called "sternal ribs." By means of these cartilages the anterior pairs of ribs are connected with the breastbone or sternum, which may consist of a single piece, as in the whalebone whales, or of several segments arranged longitudinally. The posterior pairs of ribs are sometimes called "floating ribs" because their cartilages do not meet the sternum, but are attached to those of the more anterior pairs, or are quite free. The lumbar vertebrae follow the dorsals and are without ribs. In number they vary from 2 to 30 in different forms. The number of dorsal and lumbar vertebrae combined is quite constantly 23 in the odd-toed ungulates (horse, rhinoceros, tapir, etc.), 19 in even-toed ungulates (deer, ox, sheep, etc.), and 20 or 21 in carnivores and most insectivores. Man, the higher apes and many bats have 17. Following the lumbar is the sacrum, consisting usually of three vertebrae joined together and connected with the pelvis. This region is not distinguishable in the whales and sea-cows, which lack hind limbs. The caudals, or tail-vertebrae, complete the column. In man, and in certain apes and bats they are three in number and rudimentary, but as many as 46 are present in the long-tailed pangolins. In the intervals between the anterior caudals below are situated small V-shaped bones, called chevrons, whose chief function is to protect the larger blood-vessels of the tail. They

are especially well developed in the whales and edentates.

In many groups of mammals the anterior limbs are connected with the axial portion of the skeleton through the pectoral girdle, consisting of the shoulder blades, or scapulae, and the collar-bones or clavicles. The scapula is not attached directly to the vertebral column, but its acromion process is joined to the anterior end of the breastbone, or sternum, by means of the clavicle. Clavicles are wanting in all seals, whales, sea-cows and ungulates, and are rudimentary or wanting in various representatives of several other groups. They are present in man and, with one or two exceptions, in all monkeys, bats, insectivores and marsupials. The upper-arm bone, or humerus, articulates superiorly with the scapula, and below with the two bones of the fore-arm, the radius and ulna. In the majority of mammals the radius, or outer bone, is permanently crossed over the ulna at the lower end, as is especially well seen in the elephants. In man and a few other forms the radius can be rotated. Following the fore-arm is the wrist or carpus, consisting of two rows of small bones, which, however, are variously united in different forms; and finally the digits, which are normally five in number, each consisting when fully developed of a metacarpal bone and three other bones, called phalanges, though the first digit, or thumb, usually has but three in all. In man and apes the thumb is opposable to the other digits. In many mammals this digit and also the fifth are greatly reduced, or entirely wanting. In the ruminants, such as the pig, ox, deer, camel, etc., the first digit is wanting, and the 2d and 5th are reduced in size, or entirely lacking, while the 3d and 4th are equal in length and well developed. In the odd-toed ungulates, such as the horse, rhinoceros, tapir, etc., the 3d digit is longest, the others being reduced in length, rudimentary, or wanting. In ungulates the metacarpals are usually much elongated and in such ruminants as the deer, ox, etc., are united, forming what is known as a "cannon bone." The cetacea are peculiar in that the bones of the fore-limb are not movably articulated and that the phalanges of the middle digits often greatly exceed three. In bats the phalanges are very greatly elongated to give support to the wing membranes.

The hind-limb is connected with the vertebral column through the pelvic girdle, which is united with the sacrum. The bones of the hind-limb, which are homologous to those of the fore-limb, are the femur or upper leg-bone, the tibia and the fibula or lower leg-bones, the tarsal or ankle bones, and the metatarsals and phalanges, constituting the hind-foot. The peculiarities of the bones of the fore-feet in ungulates, already mentioned, are found also, with only slight modifications, in the hind-feet.

The terminal phalanges of both fore and hind feet are compressed and pointed in beasts of prey and such as climb or dig, forming claws, which are covered with horny sheaths. In large running mammals, the terminal phalanges are more or less broad and flat and likewise covered with horny sheaths, forming hoofs or nails. Certain bones not connected with the skeleton, such as the *os penis*, *os cordis*, etc., are developed in the viscera of various mammals.

Teeth.—In mammals, unlike the lower ver-

4. Ape—arboreal type.

MAMMALS

tebrates, teeth are not produced indefinitely, but in fixed number. Only two sets are developed. The first, called the milk dentition, appears during infancy, being replaced by the second set, called the permanent dentition, as maturity is reached. The milk teeth are less numerous and usually smaller than those of the permanent set. Teeth occur only in the premaxillary and maxillary bones, and the mandible or lower jaw. The upper teeth are divided into incisors, which are implanted in the premaxillæ; canines, which are almost invariably simple and stand immediately behind the suture between the premaxillæ and maxillæ; and premolars and molars, which occupy the edges of the maxillæ. The premolars have "milk" predecessors, while the molars have not. The nomenclature of the teeth of the lower jaw is the same as for those of the upper jaw, their character being determined by their relation to the latter and by their form and mode of development. While the greatest diversity exists as to the form of the individual teeth, and the development of the dentition as a whole, there are rarely more than 44 in all. The exceptions are among the marsupials, where the number rises to 54 in the marsupial anteater, *Myrmecobius*, and to 64 in a fossil form, *Amphitherium*; also among the cetacea, one species of which has as many as 246 simple teeth. The true anteaters, *Myrmecophagida*, and the spiny anteater of Australia, *Echidna*, are without teeth at any time, but many mammals which do not possess them when adult, have rudimentary teeth in the fetal stages. Such is the case with the whalebone whales, and with the platypus, *Ornithorhynchus*. The rudimentary teeth in these disappear early and are replaced by whalebone in the case of the whales, and by horny plates resembling teeth, in the platypus.

Teeth consist of two portions, the root and the crown. When most complex they contain three structural elements, the enamel, the dentine and the cement. The enamel is hardest and is restricted to the crown, while the dentine makes up the mass of the tooth, and the cement usually surrounds the root, or fills spaces between the enamel-folds of the crown. The enamel develops from the epithelial tissue of the jaws, the dentine from the deeper-lying areolar tissue, and the cement from the walls of the tooth-capsule. Some teeth, such as the incisors of rodents, the tusks of the elephant, etc., grow continuously during life; others complete their growth early. Especially remarkable forms of teeth are the tusks of elephants, which are incisors, and the tusks of the narwhal, the boar and the babirusa, which are canines. When the crowns of the teeth greatly exceed the roots, as in the horse, the teeth are said to be hypsodont or hypselodont; when the reverse is the case, the teeth are called brachydont. Teeth having the crown in the form of tubercles, as in the hog, are called bunodont; those with transverse ridges, as in the ox, many rodents, etc., are called lophodont.

Alimentary Canal.—The mouth, or entrance to the alimentary canal, contains the tongue, which in the majority of mammals is so attached below that it can be protruded but a short distance, but is often sufficiently free to be used in grasping food and turning it about in the mouth during the process of mastication. In those mammals which feed upon ants and termites, such as the anteaters, pangolins, etc.,

and also in certain fruit-eating bats, the tongue is very long and slender and can be extended far beyond the mouth. On the posterior surface of the tongue are the organs of taste, and the upper surface is often roughened by horny papillæ. A number of large glands, called salivary glands, open into the mouth. Their function is to moisten the food and initiate the process of digestion. The glands most constantly present are the parotid, situated at the base of the ear, and opening inside the cheek, and the submaxillary, situated near the angle of the lower jaw, and opening under the apex of the tongue. At the back of the mouth is the entrance to the cesophagus or gullet, usually a simple tube, leading to the stomach. The stomach is an oblong, curved sac, usually enlarged at the cardiac end where the cesophagus is attached, and smaller at the lower, or pyloric, end, where it joins the intestines. It is usually simple, but in the ruminants and the cetaceans consists of several chambers. The intestines join the stomach at the pyloric end. They are usually of great length, and divided into two distinct sections. The portion nearest the stomach, called the small intestine, is joined below by one of larger diameter called the large intestine. The upper end of the latter is frequently dilated, forming a pouch called the cæcum, which in herbivorous mammals, and notably in rodents and many ungulates, is greatly enlarged or elongated. In man, the higher apes and the marsupial wombat it terminates in a narrow prolongation called the vermiform appendix. Different sections of the small intestine have received the names duodenum, jejunum and ileum; and of the large intestine, colon and rectum. The inferior orifice of the intestines is the anus or vent. Generally speaking, the intestines and cæcum are shortest in carnivorous mammals and longest in such as are vegetable feeders, but the carnivorous whales and seals, which have long intestines, form a conspicuous exception.

Besides the numerous glands situated within the intestine, are two large ones, the liver and the pancreas, whose ducts open into the intestines near the stomach. The liver is a large, flat gland, which may be divided merely into a right and a left lobe as in man, the cetacea and ruminants, or may have these lobes again subdivided into two by a longitudinal fissure. Two smaller lobes, called the Spigelian lobe and the caudate lobe, are commonly added. Attached to the liver is the gall-bladder, which is, however, absent in the cetacea and some other orders.

Kidneys.—The kidneys, whose function is to secrete urine, are situated in the upper part or the abdominal cavity near the vertebral column. They are two in number, oblong and usually simple, but in the cetacea, and also in bears and seals, are divided into separate lobules. A duct or ureter leads from each kidney to the urinary bladder, from which in turn a common duct, called the urethra, leads to the exterior of the body. In the monotremes, however, the ureters do not enter the bladder, but into a common urogenital passage or cloaca.

Lungs.—The lungs are situated in the thorax, which is cut off below from the abdominal cavity by a muscular diaphragm whose action assists in the process of breathing. The lungs consist of two spongy lobes, a right and a left, which are free below, but attached above to the two principal divisions of the wind-

MAMMALS

pipe. In the cetacea and sea-cows, the lobes are simple externally, but in other orders are more or less subdivided. A third median lobe, called the azygos lobe, is present in some groups. Air breathed in through the nostrils reaches the lungs through the trachea or windpipe, the upper end of which, the larynx, lies in the throat. Its orifice, the glottis, is protected by a cartilage, called the epiglottis, which prevents particles of food from entering the windpipe. The larynx is made up of cartilages, of which the largest are the thyroid, the cricoid and the arytenoid. Within the larynx are the vocal cords, two parallel elastic, fibrous bands, whose vibrations produce the voice. The lower end of the windpipe divides into two smaller tubes, or bronchii, each of which enters a lobe of the lungs and subdivides into numerous smaller branches. A third bronchus, which enters the right lung, occurs in some cetaceans and ruminants.

Heart.—The heart in mammals is four-chambered, consisting of two thin-walled auricles and two ventricles, both with thick walls, but the right, which supplies only the lungs, thinner than the left. There is no direct communication between the left and right sides of the heart after birth. The valve between the right auricle and the right ventricle is tendinous, except in the monotremes.

The aorta, or principal artery, bends toward the left immediately beyond its connection with the heart and gives off the innominate, left common carotid, and brachial arteries, which, with their branches, supply the head and anterior limbs. Blood is carried from the alimentary canal to the liver by a single vein, except in the monotremes, in which as in lower vertebrates the abdominal vein is present. The kidneys are supplied with blood only by the renal arteries.

Brain.—Except for certain fossil forms, the brain of mammals is characterized by its relatively larger size as compared with that of lower vertebrates, and especially by the magnitude of the cerebral hemispheres and the perfection of the connections between them. In most mammals the surface of the brain is divided by numerous irregular fissures and convolutions. They are absent only in small bats, rodents, and insectivores, and in the *Ornithorhynchus*. The largest forms in each order, generally speaking, exhibit the greatest complexity, and there has been a remarkable development in the class in this direction since Tertiary times. The cetacea have very large and complex brains, though they are small relatively, when compared with the size of the body.

Sense Organs.—The organs of sense, except that of touch, are located in the head. The sense of touch is generally distributed over the skin, but is most acute in the snout, and in the extremities, except when used merely in locomotion. The wings of bats and the prehensile tails of monkeys are also especially sensitive. Some burrowing mammals, such as the mole, have imperfect eyes, the optic nerve being more or less atrophied. The Indian river-dolphin, *Platanista*, is a blind form, having rudimentary eyes, without crystalline lenses. The mammalian ear is characterized, beside the chain of ossicles, already mentioned, by the complex cochlea, which is usually spirally convoluted. The tympanic membrane, or eardrum, seals the auditory chamber from without. In the majority of

mammals the external orifice of the ear is surrounded by a fold of skin, called the pinna or external ear. These are absent in cetaceans, sea-cows, seals, etc., which live in the water, and also in some burrowing mammals.

Reproductive System.—In mammals the female reproductive organs comprise the ovaries, Fallopian tubes or oviducts, uterus and vagina. The ovaries are two in number, a left and a right. Approximated to them are the Fallopian tubes, which widen below and form the uterus. In the lower mammals the uterus of each side is separate, but the two unite below in a common vagina, while in the higher groups, the uterus and vagina are both single. The male organs comprise the testes, spermatic cord, and penis. In cetaceans, sea-cows and seals, which are aquatic, and in the elephants, camels and many edentates, the testes are internal in position, but in most other forms they descend periodically, or permanently, into a pouch of the integument, called the scrotum. The structure of the penis in mammals is peculiar to the class. An *os penis* is present in the majority of bats, insectivores, rodents, carnivores and primates.

During development the mammalian foetus is nourished through a complex structure, called the placenta, formed in part by the internal wall of the uterus of the mother and in part by the membranes of the foetus itself. The placenta is characteristic of the class as a whole, but is not found in the monotremes, or in most marsupials. The form and other characteristics of the placenta differ in the several orders of mammals and are regarded as of importance in classification.

Distribution.—The geographical distribution of existing mammals, as of other animals, is the result of varied conditions and influences, some transient and others of long continuance, beginning in the relatively remote geological times when the class first made its appearance. Among the principal factors in the problem of distribution may be included changes in the extent and configuration of the land areas of the globe, changes in climate and in food supply, the appearance and disappearance of enemies, and last, but by no means least, the interference of man. These and other factors in distribution are considered under the heading GEOGRAPHICAL DISTRIBUTION OF ANIMALS. It is only possible here to mention some of the more important facts in the distribution of mammals. Of widest distribution are the purely aquatic orders, the cetacea and pinnipedia, whose range covers all seas and reaches from pole to pole, but it should be noted that no sea-lions occur in the North Atlantic. Next follow the bats, whose range is nearly world-wide, but they do not enter the antarctic zone, and only very few species cross the arctic circle. On the other hand, they are found in New Zealand and in oceanic islands where no terrestrial indigenous mammals occur. Of the purely terrestrial orders, the rodents have the widest range, covering every continent and reaching from the arctic zone to Patagonia and Tasmania. Carnivores, like rodents, have an almost world-wide distribution, but in Australia only one species of the order occurs, the dog known as the "dingo," *Canis dingo*; and it is uncertain whether this may not have been introduced by man at a remote date. The monotremes (comprising only the genera *Ornitho-*

MAMMALS

rynchus, *Echidna* and *Proechidna*) are limited to Australia, Tasmania and New Guinea. Marsupials occur only in Australia, Tasmania, New Guinea and America. The American marsupials, with the exception of one genus, all belong to the family *Didelphidae*, or the opossums. Edentates occur only in America, southern Asia and Africa. They have their greatest development in South America. One genus, *Tatu*, extends northward into Texas. Ungulates inhabit all continents except Australia, but only two or three species enter South America. Of the two groups forming the order *Primates*, the lemurs and lemuroids occur only in Madagascar, Africa and southern Asia, while monkeys inhabit only Africa, southern Asia, and South and Central America. One ape, *Macacus inuus*, is found at Gibraltar, but it is only doubtfully indigenous.

Fossil Mammals.—Mammals are believed to have originated as an off-shoot from certain Permian and Triassic reptiles called *Theromorphs* or *Anomodontia*. The earliest recognizable remains of mammals are certain small teeth and jaw-bones found in the Triassic formations. They belonged to forms resembling monotremes and marsupials in some characters, but are usually placed in a separate order, called *Allotheria* or *Multituberculata*. Representatives of the *Allotheria* continued on through the Jurassic and Cretaceous. The existing orders of mammals first appear in the Eocene, the lowest formation of the Tertiary period, being foreshadowed in the lowest beds of that period by certain generalized groups such as the *Creodonta* and *Condylarthra*. The Eocene also contains remains of several groups, or suborders, of ungulate mammals, which have no living representatives. These are the *Ancylopoda*, *Tyotheria* and *Toxodontia*.

The later Tertiary and the Quaternary periods show a greatly increased number and diversity of forms. Many of them represent families which persisted for only a relatively short period and are now extinct; others have continued to the present. Among the oldest of existing genera are *Didelphis* (opossum), *Sciurus* (squirrel), *Myoxus* (dormouse), *Sorex* (shrew), *Vespertilio* and *Vesperugo* (bat), and *Viverra* (civet), which originated in the Eocene; *Tapirus* (tapir), *Rhinoceros*, *Giraffa* (giraffe), *Elephas* (elephant), *Sus* (pig), *Talpa* (mole), *Erinaceus* (hedgehog), *Mustela* (marten), *Lutra* (otter), *Hyæna*, *Felis* (cat), and *Phoca* (seal), which originated in the Miocene.

Classification.—The class *Mammalia* was divided by Linneus into three principal sections, *Unguiculata*, *Ungulata*, and *Mutica*. The last comprises the cetaceans, the second all the ungulates except the elephant; and the first, the remainder of the class. This classification was replaced by Blainville, who proposed on embryological grounds to divide the class into *Mono-delphia*, or mammals with a placenta; *Didelphia*, or mammals without a placenta (the marsupials), and *Ornithodelphia*, or the monotremes. Richard Owen combined the last two subclasses under the name of *Eplacentalia*, and gave the placental mammals the name of *Placentalia*. Speculation as to the origin of the class as a whole led Huxley to propose as the source, a hypothetical group which he named *Hypotheria*, the characters assigned

being the absence of milk glands and of a corpus callosum in the brain, and the presence of a quadrate bone for the articulation of the mandible. Existing mammals were divided into *Prototheria*, comprising the monotremes, *Meta-theria*, the marsupials, and *Eutheria*, the so-called placental mammals. Cope in 1889, while retaining the subclass *Prototheria* for the monotremes, placed the entire remainder of the class in the subclass *Eutheria*. Flower and Lydekker (1891) adopt Huxley's divisions, while Beddard (1902) makes use of those of Cope. Flower and Lydekker's arrangement of families and higher groups is as follows (fossil groups printed in italics):

Subclass 1. PROTOTHERIA.

Order 1. Monotremata (Monotremes).

Families: *Ornithorhynchidae*, *Echidnidae*. (Group, *Multituberculata* or *Allotheria*.)

Families: *Plagiaulacidae*, *Polymastodontidae*, *Tritylodontidae*.)

Subclass 2. METATHERIA.

Order 2. Marsupialia (Marsupials).

Suborder 1. Polyprotodontia.

Families: *Dromatheriidae*, *Amphitheriidae*, *Spalacotheriidae*, *Didelphyidae*, *Dasyuridae*, *Peramelidae*.

Suborder 2. Diprotodontia.

Families: *Phascologyidae*, *Phalangeridae*, *Diprotodontidae*, *Nototheriidae*, *Macropodidae*.

Subclass 3. EUTHERIA.

Order 3. Edentata (Edentates).

Families: *Bradypodidae*, *Megatheriidae*, *Myrmecophagidae*, *Dasyopodidae*, *Glyptodontidae*, *Manidae*, *Orycteropodidae*.

Order 4. Sirenia (Sea-cows).

Families: *Manatidae*, *Rhytinidae*, *Halicoridae*, *Halitheriidae*.

Order 5. Cetacea (Cetaceans).

Suborder 1. *Mystacoceti* (Whalebone whales).

Family: *Balenidae*.

Suborder 2. *Archæoceti*.

Family: *Zeuglodontidae*.

Suborder 3. *Odontoceti* (Toothed whales).

Families: *Physeteridae*, *Platanistidae*, *Delphinidae*.

Order 6. Ungulata (Hoofed mammals).

Suborder 1. *Artiodactyla* (Even-toed ungulates).

Families: *Hippopotamidae*, *Suidae*, *Charopotamidae*, *Anthracotheriidae*, *Merycotamidae*, *Cotylopidae*, *Anoplotheriidae*, *Dichodontidae*, *Tragulidae*, *Camelidae*, *Perbrotheriidae*, *Cervidae*, *Giraffidae*, *Antilocapridae*, *Bovidae*.

Suborder 2. *Perissodactyla* (Odd-toed ungulates).

Families: *Tapiridae*, *Lophiodontidae*, *Palæotheriidae*, *Equidae*, *Rhinocerotidae*, *Lambdotheriidae*, *Chalicotheriidae*, *Titanotheriidae*, *Macrauchenidae*.

Suborder 3. *Toxodontia*.

Families: *Toxodontidae*, *Tyotheriidae*.

Suborder 4. *Condylarthra*.

Families: *Periptychidae*, *Phenacodontidae*, *Meniscotheriidae*.

Suborder 5. *Hyracoida* (Conies).

Family: *Hyracidae*.

Suborder 6. *Amblypoda*.

Families: *Pantolambdidae*, *Coryphodontidae*, *Untatheriidae*.

MAMMARY GLANDS—MAMMON

Suborder 7. Proboscidea (Elephants).

Families: *Dinotheriidae*, *Elephantidae*.

(Group *Tillodontia*.)

Families: *Anchippodontidae*, *Calamodontidae*.)

Order 7. Rodentia (Rodents)

Suborder 1. Simplicidentata.

Families: *Anomaluridae*, *Sciuridae*, *Haplo-*
dontidae, *Ischyromyidae*, *Castoridae*,
Myoxidae, *Lophomyidae*, *Muridae*, *Spa-*
lacidae, *Geomyidae*, *Dipodidae*, *Therido-*
myidae, *Octodontidae*, *Castoroididae*,
Hystriidae, *Chinchillidae*, *Dinomyidae*,
Caviidae, *Dasyproctidae*.

Suborder 2. Duplicidentata.

Families: *Lagomyidae*, *Leporidae*.

Order 8. Carnivora (Carnivores).

Suborder 1. Carnivora vera (Fissipeds).

Families: *Felidae*, *Hyenidae*, *Prote-*
lidae, *Viverridae*, *Canidae*, *Ursidae*, *Mustelidae*,
Procyonidae.

Suborder 2. Pinnipedia (Pinnipeds).

Families: *Otariidae*, *Trichechidae*, *Phocidae*.

Suborder 3. *Creodontia*.

Families: *Hyenodontidae*, *Proviverridae*,
Arctocyonidae, *Mesonychidae*.

Order 9. Insectivora (Insectivores).

Suborder 1. Insectivora vera.

Families: *Tupaidae*, *Macroscelididae*,
Erinaceidae, *Soricidae*, *Talpidae*, *Pota-*
mogalidae, *Solenodontidae*, *Centetidae*,
Chrysochloridae.

Suborder 2. Dermoptera.

Family: *Galeopithecidae*.

Order 10. Chiroptera (Bats).

Suborder 1. Megachiroptera.

Family: *Pteropidae*.

Suborder 2. Microchiroptera.

Families: *Vespertilionidae*, *Nycteridae*,
Rhinolophidae, *Emballonuridae*, *Phyllo-*
stomatidae.

Order 11. Primates.

Suborder 1. Lemuroidea (Lemurs and Lem-
uroids).

Families: *Hyopsodontidae*, *Chiromyidae*,
Tarsiidae, *Lemuridae*.

Suborder 2. Anthropoidea (Monkeys and
Man).

Families: *Hapalidae*, *Cebidae*, *Cercopithe-*
cidae, *Simiidae*, *Hominidae*.

The groups of existing mammals whose structural peculiarities are such as to entitle them to rank as separate families vary greatly as regards the number of genera and species they comprise, some being represented by a multitude of different forms, while others consist only of a single species, or a single genus with but a few species. Families consisting of only a single genus and species are as follows: the *Chiromyidae*, established for the reception of the Aye-Aye, a singularly modified lemuroid mammal, confined to Madagascar; the *Dinomyidae*, comprising only a large Peruvian rodent, somewhat like a paca, of which a single specimen is known; the *Antilocapridae*, represented only by the Prong-horn of the western plains of North America; the *Notoryctidae*, comprising only a small mole-like marsupial recently discovered in South Australia; the *Ornithorhynchidae*, comprising only the Platypus, or Duckbill, of Australia. These and other restricted families are to be looked upon as fragments of groups of genera and species, of which the greater num-

ber are extinct, or as branches from main lines of development which have never progressed and ramified.

FREDERICK W. TRUE,

United States National Museum.

Mammary Glands, the milk-glands of mammalian animals (see BREAST). They are present in all mammals, in both sexes, but in the male are usually rudimentary, their functional activity being limited to the female, who secretes in these glands the milk for nourishing her young during a natural period after birth. In all mammals they are placed in pairs, but vary much in position and number in different groups. Zoologists give them names according to their position near the armpits (axillary), on the chest (pectoral), on the belly (ventral or abdominal), or near the groin (inguinal). They are never situated on the back. The number in an individual may be from two to twelve or more, and is usually even. The structure of the cow's udder is due to the uniting of the same number of mammary glands as there are of teats, the number of which, when more than two, usually corresponds to that of the young produced at each birth. The mammary glands of *Marsupialia* (q.v.) are contained in the pouch. In monotremes—duck-bills and echidnas—the nipple is not present. (See PROTOHERIA.)

Diseases of the Mammary Glands.—The common inflammation of the glands (mastitis) is often attended by much swelling, with fever and painful tenderness. The formation of pus is apt to result in a slowly pointing abscess. Great care in diet and regulation of the bowels should be observed. Purgatives and fomentations may be necessary, also in many cases the placing of the arm on the affected side in a sling. Drawing off the milk and evacuating the pus may be practicable, and will afford great relief. Pain in the breasts (mastodynia) may result from many causes, of which sore nipples is one of the most frequent. The nipples are also subject to cracks, ulcerations, etc., which occasion much difficulty and pain to the mother when suckling the child. Lotions of an astringent character, as tannin, etc., have a remedial effect in such disorders, as have also collodion and lunar caustic (nitrate of silver), when applied to the sore nipple. Metallic shields are used in severe cases for protection of the affected point. Among many specific disorders to which the mammary glands are liable are cancer and galactoceles and other forms of tumor. See MILK FEVER.

Mammee' Apple, or **South American Apricot**, the fruit of a clusiaceous tree, bearing white, showy, fragrant flowers, growing naturally in tropical America, but largely cultivated in tropical parts of the Old World. The fruit is several inches in diameter, with a double rind and a yellowish pulp like that of an apricot, which is sweet and nourishing, and is eaten raw or with wine and sugar, or is boiled. A spirituous liquor called Eau Cr  le, is distilled from its flowers; and the gum exuding from the bark is used by the Central Americans for destroying chigoes in the feet. This gum-resin is similar to the "gamboge," derived from a closely related West African tree (*Garcinia hamburyi*).

Mammon, a term popularly held to be a mere personification of riches. It is used in

MAMMOTH—MAMMOTH CAVE

Matt. vi. 24 and Luke xvi. 9. Milton makes Mammon a fallen angel of sordid character.

Mammoth, an elephant (*Elephas primigenius*) which inhabited the temperate parts of the northern world during the Glacial period, and at its close spread northward with the retreat of the ice, and survived until the Neolithic period of human history. Some account of the origin and probable wanderings of the species is given in the paragraph relating to fossil elephants under ELEPHANT. Mammoth remains have been found in intimate association with the handiwork of savage man; and upon a piece of bone a portrait of this animal was found scratched, the accuracy of which shows a close acquaintance by the Cave-dwellers of France with the animal in life, and much artistic skill. This elephant, although the word "mammoth" has become an expression for hugeness, was little if any larger, on the average, than the modern Asiatic elephant, to which it was nearly related. Its remains are abundant and enable us to reconstruct its form and features completely, especially since the remarkable discovery, first in 1799, of carcasses frozen into the icy cliffs along the Arctic coast of Siberia. The latest and most important discovery of this kind occurred in 1901. Since the earliest known times ivory from buried tusks of these animals has been obtained from northern Siberia and Alaska, and many curious stories were invented to account for its origin, especially among the Chinese, who had never seen an elephant; but the specimens above mentioned contained not only the tusks still in their sockets, and every bone in its place throughout the skeleton, but a great part of the flesh was in a condition fit for sledgedogs to eat and enjoy, and was covered with thick skin still clothed with long dark hair, beneath which was a dense woolly fur, well fitted to protect the animal against arctic cold. The ears were much smaller than those of modern elephants. This specimen of 1901, which is preserved in the Royal Museum at St. Petersburg in the attitude in which it was found buried, measured 16 feet 4 inches from the forehead to the extremity of the tail; its height was 9 feet 4 inches; and the tusks, along the outer or greater curve, measured 9 feet 6 inches. Of other well-known specimens, that skeleton mounted in Chicago is one of the largest known, and its tusks measure 9 feet 8 inches. The largest tusks on record are a pair found in Alaska, which measure 12¾ feet in length. All mammoth tusks show an outward and upward sweep very distinct from the growth of elephant tusks. The mammoth seems to have been extremely numerous all over northern Europe, Asia and North America, especially during post-glacial times, when northern Asia was covered with pine forests to the borders of the Arctic Sea, affording plentiful food in their leaves and twigs upon which these animals browsed. The disappearance of these forests, due to slow climatic changes, is supposed to be the principal influence which led to the extermination of the species, a fact otherwise not easily to be explained. It is probable that human hunting had much to do with the mammoth's final disappearance. Consult; Beddard, 'Mammalia' (1902); Lucas, 'Animals of the Past' (1901). Compare MASTODON.

Mammoth Cave, Ky., a remarkable American cavern, in Edmondson County, 85 miles southwest of Louisville, reached by a small branch line connecting at Glasgow Junction with the Louisville & Nashville railroad. Its areal diameter is about 10 miles, and about 100 miles of passage-way have been explored, including avenues, chambers, pits, domes and rivers. What is termed the Main Cave is three miles long, varying in width from 40 to 175 feet, and in height from 40 to 125 feet. Its greatest enlargement is known as the Chief City (or Temple), an oval room 541 feet long, 287 feet wide, and 125 feet high; anciently a rendezvous of the Indians, whose torches and other relics have been found in abundance. The Star Chamber mimics the starry heavens by reason of its lofty ceiling of black oxide of manganese flecked by snowy crystals of gypsum. The cavern exists in five successive tiers, through which, at various points, shafts have been cut, which are styled pits or domes, according to the point of view. The largest are the Bottomless Pit, Gorin's Dome, the Mammoth Dome, and the Maelstrom, and their average depth is about 100 feet. Oval depressions, locally known as "sink-holes," drain through the pits and chasms, and form subterranean lakes and rivers; which finally find an outlet to the neighboring Green River. The largest, the Echo River, gets its name from the wonderful reverberations of sound along its course. Boats are provided for short voyages. Eyeless fish abound, of which there are three or four species; besides, blind crawfish, blind crickets, flies, beetles and spiders, and other abnormal fauna, are found on the walls and under the rocks. The structure and habits of these animals have been studied with great care.

Beyond River Hall long avenues extend, many adorned by marvellous gypsum rosettes and brilliant arches of crystal efflorescence in the most fantastic diversity. Cleveland's Cabinet is frequently mentioned as a treasure-house of cave flowers; but some of the smaller rooms, for instance, Charlotte's Grotto, can boast of finer displays. The great cavern is said to end at Croghan's Hall, where is the Maelstrom already mentioned, but the few who have dared go to the bottom of this profound abyss report wide and long avenues beyond, which are yet to be explored. Everywhere, even in the deepest pits, the atmosphere is both chemically and optically pure; the temperature is uniformly about 54° F., all the year around, as has been determined by a long series of exact scientific observations, in order to discover the temperature of the crust of the earth.

The discovery of the Mammoth Cave is usually credited to a hunter named Hutchins, in 1809; but the present manager of the estate finds that the county records, in 1797, fix the entrance to this cavern as a landmark for a piece of real estate. The locality first gained notoriety by reason of its immense deposits of saltpeter, which were used in the manufacture of gunpowder, during the War of 1812. After passing through the hands of several owners, the cave was bought by Dr. John Croghan, who willed it to his nephews and nieces, with instructions that at their death it should be sold at auction. An earnest wish has been expressed by many that the famous cavern should even-

tually become a State or National park. See also CAVES; CAVE ANIMALS. H. C. HOVEY,

Author of 'Celebrated American Caverns.'

Mammoth Hot Springs. See YELLOWSTONE PARK.

Mam'o, a bird (*Drepanis pacifica*) of the Hawaiian Islands, related to the creepers, and now nearly extinct because of the great demand in past years for their yellow feathers for making the feather-cloaks formerly worn as insignia of royalty by the chiefs. Other birds supplied certain other required feathers. Very few of these cloaks remain in museums.

Mamoré, mā-mō-rā', a river of Bolivia which has its rise in the Cordillera Real, near Sucre, and flows first east by south, then forms almost a semicircle toward the north to Trinidad, from where its course is nearly north to where it unites with the Beni and forms the Madeira River. In the first part of its course it is called Rio Grande. The Mamoré is about 1,300 miles long and navigable for about 1,000 miles, with some obstructions. About 40 miles above its junction with the Beni are the Guajara Falls, above which navigation is free for about 400 miles to places where fallen logs have filled in between the banks and formed dams.

Mam'palon, an aquatic animal (*Cynogale bennetti*) of Borneo, of the civet family. It is otter-like in form, is about 18 inches long, has stout webbed plantigrade feet, and is thoroughly adapted to an aquatic life while retaining purely viverrine characteristics of structure.

Man (*Homo sapiens*), the most highly developed of the animals of the earth, differing from the other creatures in intellectual and spiritual nature, but so closely resembling them in physical organism that it is perfectly clear from the point of view of the comparative anatomist that he is not to be separated from the animal kingdom. Physiologically the distinction between man and the anthropoid ape is slight. As to the place of man in the animal kingdom there is some doubt, largely a matter of technical nomenclature. The point at issue is whether man is to be put in a separate order, and, if not, just what higher animals are to be included in the same order with him. The view that man is to be grouped with the anthropoid apes is taken by Huxley, Darwin, and Haeckel, all following Linnaeus; it is the predominant view, and classes man with the apes in the order *Primates*. Sir Richard Owen, who followed Cuvier, was the foremost scientist of the 19th century to classify man as a separate order of the mammals, the *Bimana* in opposition to the *Quadrumana*. The order of *Primates*, to take the more authoritative classification, is divided into: the *Lemurida*, of which the lemurs (q.v.) are typical; the *Simiada*, including the "higher" apes; and the *Anthropoida*, Man. The question as to the demarkation and the interrelation between the last two classes then arises. Comparative embryology may furnish some clue to this in the future; at the present the development of the embryo of the simians is almost entirely unknown. Geology and palæontology on the other hand not only have furnished no great assistance to this problem, but in the nature of the case are not likely to do more in the future. Haeckel's *Pithecanthropus* is little more than nomenclature; and it is only in minor degrees

that the lowest form of man approaches the most highly developed ape. Haeckel urges the contrast between the snub-nosed human races and the nose ape (*Semnopithecus nasicus*), and holds that the latter has a better claim to being created in the divine image; but this argument scarcely affects the case, for the points are not typical, and the evidence not so conclusive as skeletal identities, for instance, would be.

But if identities and approximate resemblances are hard to find, the distinguishing marks, especially anatomically, are evident. Foremost is the erect position of man as contrasted with the carriage of the apes. For no ape assumes a perfectly erect posture, and the attempts of the ape to stand erect are brief as well as unsuccessful. The human skeleton shows an obvious adaptation for the erect posture; the pelvis is wider than it is broad, and is shorter and stronger than in the ape; the articulations of the thigh are wider apart because of the breadth of the sacrum; the femur is longer than in any other animal and much more nearly in the same line with the axis of the trunk; and the spine has a double curve, which makes the erect posture possible. The human skull, however, exhibits the most striking differences from that of the ape. In the first place it is differently balanced, less of the mass of the head lying anterior to the line of the spinal cord, and much of the brain being posterior to the occipital condyles. Secondly, the facial bones are elongated downward and do not project forward. This difference may be due to the difference in posture noted above; the projection of the lower part of the ape's head makes it possible for the ape to look horizontally when on all fours, and to look up when in the semi-erect posture of tree-climbing, for example. The cranial capacity of the lowest savages averages about 100 per cent more than in the biggest-headed apes; hence the facial angle is entirely different. The difference between the hand of man and of the ape, and the distinctly plantigrade locomotion of man as opposed to the movement of the ape are further distinctions.

With these and other anatomical differences it is probably nearer the truth to consider man as the product of evolution from an ancestor common to him and to the simians, no matter how anthropoid the latter, than to make him, as hostile and superficial critics of Darwin would have it that evolution made him, a direct descendant of any ape. This is hinted by other important facts; thus the dentition of man is nowhere closely paralleled among the so-called *Quadrumana*, save in the case of a lemur, *Tarsius*, which alone has no intervals between the canines and the adjoining teeth, and which in no other respects bears any striking resemblance to man. The Darwinian Theory (q.v.), in so far as it was concerned with the descent of man, put stress on his ultimate and less immediate ancestry and on the steps in this development, urging, in brief, a line of evolution from naked molluscan Ascidiæ, successively through lower fish forms, ganoid fish, amphibians, reptiles and birds to the lower mammal form, and thence to the highest. This theory finds, perhaps, its most overwhelming proofs in comparative embryology, as in Haeckel's 'Evolution of Man.' As to tracing man's genealogy further back, even Lord Rayleigh, a notable defender of biogenesis, thinks that life upon the earth originated from

mosses from other worlds, in brief, that animal life is a continuation or evolution of vegetable life—a conclusion to which the very difficulty of drawing a hard and fast line between the two naturally leads. The attempt to carry back man's ultimate ancestry still further is to be found in the theory of abiogenesis (a term introduced by Huxley in place of the less exact "spontaneous generation"). This theory is urged both by Huxley and by Haeckel, notably in his 'Riddle of the Universe' (1900); and to the same end tend the apparently successful experiments in America of Loeb and others, who would show a close connection between electro-chemic phenomena and nervous force or life itself.

The life habits of prehistoric man, as well as his antiquity on the earth, are known almost entirely from fossil remains of various sorts. The data, however, are perplexingly scanty and insufficient for strictly logical deduction. Thus, although the general character of the Neanderthal skull, as Taylor says, "is less human and more simian than any other known skull . . . its precise age is doubtful, and it would be unsafe to regard it as the type of a special race since its characteristics . . . have been occasionally reproduced in modern times." In brief, any single anatomical specimen, simply because it is isolated, may not be considered typical of the *Urmensch*, nor as evidence of his antiquity, nor as belonging to *Pithecanthropus erectus*, inasmuch as the isolated specimen may be abnormal and freakish. Actually misleading are such "fossil" finds as the various anthropolites or petrified men, for the anthropolite is not a true fossil but merely a quasi-petrification due to the action of calcareous waters, in short, is due to chemical and not to geological action. Had such remains been real fossils they would have put the appearance of man upon the earth much farther back than it can be put. The information to be gathered from utensils found together with human remains and from adjacent remains of wild beasts is valuable. Tools and hunting weapons, bones of tropical fauna and remains of man are found in the gravel beds of western Europe; it apparently follows that man antedates the Glacial period, inasmuch as this tropical fauna there was previous to the Ice Age, and since remains of Glacial fauna together with human remains occur in later (and superior) geological deposits. Thus the question of the antiquity of man becomes the simpler question of the date of the Ice Age. The answer is, 60,000 years ago at least. It is largely on the discovery of flint implements styled "chelléans" at Chelles in France that man is thus dated back to the semitropical epoch of the Pleistocene period.

The implements of prehistoric man, as ordinarily classified by material, form the basis of a division of early industrial development into the Stone Age, the Bronze Age, and the Iron Age. The use of animal sinews, bones, etc., apparently antedates the period of stone implements; hence the more elaborate classification into Zoomimic, Protolithic, Technolithic, and Metallurgic, for which see ANTHROPOLOGY, AMERICAN.

As industrial arts began in imitation of the animals, so it is possible that the worship of man began with his wonder at the beasts, and with his personifying them, and secondly all natural forces. Animism or spirit worship was probably a second stage, although Herbert Spencer makes its sub-species ancestor-worship, which

is still a live force in China, the source of all religious cults, tracing back to it totemism, as a sort of ghost-worship, and naturism, hinting that the spirits of the departed were supposed to take up their dwelling in trees and rocks. Magic is closely related in primitive cultus both with naturism and animism. (See RELIGION.) (See also ANTHROPOLOGY, AMERICAN; ANTHROPOLOGY; ETHNOLOGY; ANTHROPOMERY.) Consult: Keane, 'Man, Past and Present' (1899); Girard, 'Aide-mémoire d'Anthropologie et d'Ethnographie'; 'The American Anthropologist'; Mivart, 'Man and Apes' (1873); Quételet, 'Physique Sociale' (1869).

Man and Nature, a work of great research written in 1864 by George Perkins Marsh (q.v.). Its full title was 'Man and Nature, or Physical Geography as Modified by Human Action.' The work became at once a standard with international recognition; a considerably enlarged Italian edition was issued at Florence in 1870; and a second American edition, with further changes, appeared in 1874.

Man-eater, a term applied to any fierce animal which has acquired, or is believed to have acquired, a habit of killing human beings as food. Lions, tigers, leopards and other great cats are accused of it, and undoubtedly many of these beasts, finding how easily a man or woman among East Indian or African villagers may be struck down or seized when sleeping in a flimsy hut, make their lairs near settlements and for a time regularly subsist upon human victims. Such are sometimes, but not always, old cattle-thieves, whose teeth are worn, and which feel unable or unwilling to undertake the exertion of tracking and pulling down wild animals; but this is not always the case. When such a beast has taken his residence in a district no pains must be spared to kill him, for he will not cease his depredations. Horses, elephants, camels, etc., sometimes become man-eaters in effect, understanding and exercising their power over him for harm.

A man-eater shark is the great white or blue shark (*Carcharodon carcharias*), which is one of the largest and most formidable of fishes. See SHARK.

Man-of-the-Earth, a local name in the Southern States for the wild potato-vine (*Ipomœa pandurata*), which "over the dry soil of fields . . . spreads in summer many of its great, white, waxy flowers, effectively spotted at their bases with purple." See IPOMÆA; MORNING-GLORY.

Man in the Iron Mask, The. See IRON MASK, THE MAN IN.

Man, Isle of. See ISLE OF MAN.

Man-of-war, an armed naval vessel regularly employed in the service of a government for war purposes. See NAVY OF THE UNITED STATES.

Man-of-war Hawk, or **Frigate-bird**, a tropical web-footed bird (*Fregata aquila*), of the family *Pelecanidæ*. The color of the adult bird is shining black, glossed with green, the female being duller in hue. Including the long tail the male bird reaches 3 feet in length, but the body is extremely small. The bill is longer than the head, strong, hooked at the point, and sharp. In proportion to their size their wings are longer than in any other bird, and have an

extent of 7 feet or more. Their flight is so powerful that they are seen more than a thousand miles from shore. They move with great difficulty on land, and rarely alight on the water. Possessing great strength and superior power of wing, the frigate-bird pursues terns or gulls which have secured a fish, and by beating them with wings and beak forces them to drop or disgorge it; then seizes the prey before it reaches the water. It also catches flying-fish for itself. Its usual locality for breeding is the summit of some rocky cliff, but breeds among trees where there are no rocky shores, making a rough platform of sticks. There is only one chalky white egg. This species is found throughout the tropics, and a second species (*F. minor*) ranges about the Indian and South Pacific Oceans.

Man-yoshu, *mān-yō-shoo'*, or **Manyōshiu** (Japanese, COLLECTION OF ONE THOUSAND LEAVES), Japanese anthology, the most ancient in the language. It is believed to have been completed early in the 9th century; it comprises about 4,000 poems which form a valuable index to the history, customs, and literary attainments of the time. Among its hundreds of authors the most able are Hitomaro and Akahito. The poems form a record of about 130 years, covering the latter part of the 7th and the early part of the 8th centuries.

Manacle Rocks, England, a dangerous reef on the south coast of Cornwall, not far from Lizard Head and near the town of Falmouth. They are barely visible, except at low water, and there is no warning of their presence to the mariner except a bell buoy. Many wrecks have occurred here.

Managua, *mā-nā'gwā*, Nicaragua, (1) the capital of the state, near the southwest shore of Lake Managua, 32 miles south-southwest of Leon, consists of long rows of huts, and a large square lined with houses of two stories. The centre of the square is occupied by a large church, and there is another large church with a conspicuous white arched portal. The inhabitants, chiefly Indians, are industrious. A railway connects Managua with Corinto on the Pacific. Pop. about 30,000; (2) the lake, about 38 miles long, discharges itself into that of Nicaragua, above which it has an elevation of 16 feet, while its elevation above the Pacific is 156 feet. It has attracted a good deal of attention in connection with a proposed navigable communication between the Atlantic and Pacific.

Man'akins, a rather undefined group of South American tropical birds, mostly of the family *Pipradæ*, related to the North American tyrant-flycatchers. They are small, brightly colored (but the females are usually much plainer than the males), and the wings often bear curiously modified and often highly ornamental feathers. They are of terrestrial habits, staying upon or near the ground in wooded places, clinging to herbs and twigs of bushes like chickadees, and subsisting upon insects largely caught on the wing. Some of the species, called "dancers" in Brazil, gather in little parties in the breeding season, and go through queer active motions, called dancing. Consult: Evans, 'Birds' (1900).

Manaoag, *mā-nā'wāg*, Philippines, a pueblo of the province of Pangasinán, Luzon, sit-

uated on the Malabolo River, 18 miles east of Lingayén, an important road centre. Pop. 17,500.

Manaos, *mā-nā'oo's*, Brazil, city and capital of the state of Amazonas, on the Rio Negro, 12 miles above its confluence with the Amazon. A whitewashed cathedral rises in the centre of the town, which also has a custom house, a small fort, and a military barracks and hospital. The city is a steamboat station, and has a considerable trade in various forest products, but principally in india-rubber. Pop. about 20,000.

Manar, *mā-nār'*, or **Manaar**, Gulf of, southern India, an ocean inlet between Ceylon and the Madras coast with an extreme width of nearly 200 miles. It is almost closed at Paik Strait on the north by Adam's Bridge, a low reef of rocks and islands. The gulf has celebrated pearl fisheries.

Manasarowar, *mā-nā-sā-rō-wār'*, Tibet, a sacred lake and pilgrimage resort north of the main Himalayan range, near Darchan, between the sources of the Brahmaputra and the Indus. It is almost circular in form, about 15 miles in diameter, and is drained by the Sutlej.

Manassas, *mā-nās'as*, Va., town, in Prince William County; near a creek named Bull Run, and at the place where the Manassas Gap and Alexandria railroads meet. It is about 35 miles southwest of Washington. Twice during the Civil War Manassas was the scene of engagements. See BULL RUN, BATTLE OF.

Manassas, First and Second Battles of. See BULL RUN.

Manassas Gap, Engagement of. Gen Lee, in retreating from Gettysburg, crossed the Potomac at Williamsport, into the Shenandoah Valley, and 15 July 1863 marched to Bunker Hill, and occupied the gaps of the Blue Ridge. On 19 July he ordered Longstreet to march next morning to Culpeper Court House, by way of Front Royal and Chester Gap. Gen. Meade crossed the Potomac at Harper's Ferry and Berlin, on the 17th and 18th, and moved up the Loudoun Valley along the eastern side of the Blue Ridge; and on the 21st Merritt's brigade of Buford's cavalry division, pushing well up into Manassas Gap, skirmished with the 17th Virginia infantry, and took 20 prisoners, from whom it was ascertained that Lee was moving up the valley with the evident intention of passing to the east of the Blue Ridge. Meade ordered the Third, Fifth, and Second corps to march upon Manassas Gap, directing Gen. French, commanding the Third corps, then guarding Ashby's Gap, to hasten to Buford's support. Before dark of the 22d French reached Piedmont, and Birney's division was pushed forward to Buford's aid, followed by the remainder of the corps, and at daylight of the 23d entered the Gap and relieved Merritt's cavalry, which moved up to Chester's Gap. Meanwhile, at dawn of the 23d, Hood's division of Longstreet's corps had marched from Front Royal and, relieving the 17th Virginia, was deployed in the Gap, where it was relieved during the morning by Wright's brigade of about 600 men of R. H. Anderson's division, under orders to hold the Gap until relieved by Ewell, then marching from Winchester. Wright's brigade was deployed at the west end of the Gap, and Rodes' division, with two batteries of artillery, coming to its support, drew up about 600 yards

1

2

1. West-Indian Manatee.

2. Short-tailed Indian Manis.

in rear, and sent 250 sharpshooters to take position on its left. These dispositions were completed about 2 P.M. Meanwhile Birney's division had advanced, steadily driving in the Confederate outposts and from Wapping Heights beyond which was Wright's line. About 4 P.M. Spinola's Excelsior brigade and two regiments of Ward's went forward at a charge and, sweeping past Wapping Heights, engaged Wright's men in a close and severe fight, driving them back upon Rodes, who stood firm, the artillery checking the Union advance about dark, Rodes' line not being engaged, and losing but 15 killed and wounded. Wright's loss was 19 killed, 83 wounded, and 66 missing. French's loss was 21 killed and 84 wounded. Ewell fell back to Front Royal during the night. Next morning the Union advance marched to Front Royal, but all of Lee's army had passed and, marching swiftly through Chester and Thornton's gaps, it took position on the south side of the Rappahannock. Consult: 'Official Records,' Vol. XXVII.; Humphreys, 'From Gettysburg to the Rapidan.'

E. A. CARMAN.

Manasseh, the name of several scriptural personages: (1) eldest son of Joseph: b. Egypt. When brought with Ephraim to receive the blessing of his grandfather Jacob, the old man placed his right hand upon the head of the younger, and his left upon that of Manasseh, thus depriving the latter of the precedence due to his priority of birth. The descendants of Manasseh formed a tribe, which, in Canaan, was settled half beyond the Jordan, and half on the west side. (2) A king of Judah, who was made tributary to Esarhaddon, carried captive to Babylon, but restored upon his repentance. (3) A priest who in the time of the prophet Malachi built a rival temple on Mount Gerizim.

Manatee, an aquatic mammal or "sea-cow" of the order *Sirenia* (q.v., for general structure), several species of which inhabit the fresh waters along the eastern coasts of tropical America, and of western Africa. The body is somewhat seal-like in shape, reaches a length of eight or ten feet, has a large round head with bristly, tumid lips, no apparent neck, no external ears, the forelimbs converted into paddles, no hind limbs, and the tail spade-shaped, like that of a beaver. The thick wrinkled skin is blackish, and almost hairless, but a coat of short, seal-like fur clothes the fetus, indicating descent from furry ancestors. Structurally the manatee differs from other sirenians in having only six cervical vertebrae, and in the large number of molar teeth, which apparently go on increasing indefinitely during the animal's life,—the suggestion being, as Bedard points out, that they are worn away by the attrition resulting from so much sand being mixed with the daily food. The cleft lip to be mentioned hereafter, is also a generic peculiarity. The manatees are stupid, gentle, defenseless and harmless creatures, showing great affection for their young, one or two in number, which are nursed at pectoral udders, often while the mother stands erect upon her tail enfolding the "calves" with her broad arms. They never come ashore, but secrete themselves amid aquatic vegetation, where the only enemies they need fear are the larger alligators, and the jaguar. Their food consists of fresh-water weeds and their roots, and these are procured by means of the curious form of the upper lip:

"this is split in two, and the two halves, which are furnished with strong bristles, can play upon each other like the points of a pair of forceps." This cleft-lip is only suggested in the case of the dugong, but the fetus of that animal shows the structure plainly, indicating that the manatee is the more primitive form of the two. The flesh is excellent for food. The American manatees have been nearly exterminated. They formerly abounded in the Indian River and other marshy waters about southern Florida, but by the end of the 19th century had been reduced to a small carefully protected band near Biscayne Bay. They still survive in small numbers along the coast of the Caribbean Sea and about the mouths of the Orinoco. The Florida manatee is called by American zoologists *M. latirostris*, and is regarded as different from those of Central and South America, long known as *M. americanus*. The African species is *M. senegalensis*.

Manatt, James Irving, American educator: b. Millersburg, Ohio, 17 Feb. 1845. He was graduated from Iowa College in 1869, having previously served for a time in the Federal army. He engaged in journalism, but soon abandoned it to continue his studies and in 1877-84 was professor of Greek at Marietta College; in 1884-9 he was chancellor of the University of Nebraska and since 1893 has occupied the chair of Greek literature and history at Brown University. With Tsountas he has published 'The Mycenaean Age' (1895).

Manayunk, măn-a-yŭnk'. See PHILADELPHIA.

Man'by, George William, English inventor: b. Hilgay, Norfolk, 28 Nov. 1765; d. Southtown, Great Yarmouth, 18 Nov. 1854. He was educated at the military college of Woolwich, and became in 1803 barrack master at Great Yarmouth. His attention having been drawn to calamities resulting in cases of shipwreck, from the difficulty of establishing communication with the shore, he attempted casting a rope from the shore to the wreck by the agency of gunpowder. Chains were unable to stand the shock of the discharge, but stout strips of rawhide closely platted together were found to answer; and on 12 Feb. 1808, the entire crew of the brig Elizabeth, wrecked within 150 yards of the beach, were rescued by the simple contrivance of Capt. Manby. In 1810 his invention was brought before a committee of the House of Commons, and having been favorably reported on, he received a grant of money, and all the dangerous stations on the British coasts were supplied with his apparatus. He also contrived shells filled with luminous matter, to enable the crew to perceive the approach of the rope, in the manufacture of which he suggested several improvements. He published the 'History and Antiquities of the Parish of St. David, South Wales' (1801); 'The Preservation of Shipwrecked Persons' (1812); 'Journal of a Voyage to Greenland in 1821' (1822); and a number of writings relative to shipwrecks and to his various inventions.

Mance, Jeanne, zhăn măn's, French philanthropist: b. Nogent-le-Roi, France, 1666; d. Canada 1673. She was a religious enthusiast

MANCHESTER

and was one of the party conducted by Maison-neuve (q.v.) to Canada in 1641, and was an able assistant to him in the religious enterprises established in Canada. She was an indefatigable worker, had charge of the hospital at Montreal and exercised much influence in the government of the colony. She made several visits to France to obtain the funds necessary in the work and died head of the Sisters of Saint Joseph.

Man'chester, Conn., town, in Hartford County; on the Hockanum River, and on the New York, N. H. & H. railroad (formerly New England railroad); about eight miles east of Hartford. Until 1823, when it was incorporated as Manchester, it formed a part of East Hartford; it includes the villages of Highland Park, Buckland, Manchester, Manchester Green, and South Manchester. The town has extensive manufacturing plants, the most important being the Cheney Silk Mills. It has also cotton and woolen mills, paper mills, needle works, and electrical supply works. A large amount of tinware is made in Manchester. There are two public libraries, one in the village of Manchester, and one in South Manchester. Pop. (1900) 10,601.

Manchester, England, an episcopal and university city, inland port, and parliamentary and county borough of Lancashire, 188 miles north of London, and 31 miles east of Liverpool, on the Irwell, an affluent of the Mersey, since 1864 connected with the sea at Eastham on the Mersey, by the Manchester Ship-Canal (q. v.) 35½ miles long. It is one of the principal manufacturing cities of the world and the cotton trade centre of Great Britain. It covers over 19,800 acres. Railways and electric street tramways communicate with the surrounding towns and villages of the most populous industrial region of England.

Geology.—Manchester is built on a large plain, within easy distance of breezy hills and moorland, which are clearly visible from the outskirts of the city. The surface of the ground is composed of thick deposits of glacial drift—boulder clay, sands and gravels—beneath which are Triassic, Permian, and Carboniferous rocks. Rich coal-fields are found in the neighboring parts, some of which extend under a portion of the city.

Industries and Finances.—Though Manchester is the chief seat of the cotton trade, it is no longer that of its manufacture, much of that industry being carried on in towns and villages beyond its borders. A considerable number, however, remain of cotton mills, print works, dyeing and bleaching concerns, and factories concerned with other branches of textile manufacture. Engineering and machinery works are exceedingly numerous, as are the manufacturing of electrical appliances. It is calculated that there are about 700 different industries carried on here, some of the chief among them, apart from those named above, being chemical, india rubber, paper and glass works. The membership of the Royal exchange is over 7,000, and the Grocery exchange about 3,000. There are also stock, corn, provision, coal and cotton-waste exchanges. The vegetable and fruit market serves for the whole of South Lancashire

and part of Cheshire, while the fish market is second only to Billingsgate. There are nearly a score of banks, with numerous branches, and the amount of money 'cleared' during the year 1905 was £263,586,003. The business of the Post Office exceeds that of any other out of London.

Bridges and Railway Terminals.—The bridges are of no engineering importance, as the Irwell is here but a narrow river. The terminal railway stations are six in number. (1) London Road, 1842, rebuilt 1881; (2) Victoria, 1844, since greatly enlarged; (3) Oxford Road; (4) Central, 1877, near which the Midland Railway Company have erected a great hotel; (5) Exchange, 1884; (6) Deansgate, 1898, for the goods traffic of the Great Northern Railway. The oldest railway station in the world is still to be seen in Liverpool Road, though not used for its original purpose. It was opened in 1830.

Buildings.—The principal public building is the town hall, commenced in 1868 and completed in 1877, at a cost, including land, of upwards of a million pounds. It covers an area of 8,648 square yards. The clock-tower is 286 feet high and contains a peal of 21 bells. In the great hall is a series of frescoes by Ford Madox Brown, illustrating incidents in the history of Manchester. The old town hall, erected in 1825, is now occupied as the Free Reference Library. It is a classical building, and another of the same style and period is the City Art Gallery, formerly known as the Royal Institution. The Royal Infirmary, which originated in 1752, is situated in one of the finest positions in the centre of the community, but is about to be removed to an exclusive new building on a site on the outskirts, the old site having been purchased by the corporation for £400,000. The Free Trade Hall (1856), built in the Italian style, will hold 5,000 people and has been the scene of many great political meetings and of the renowned concerts conducted by Sir Charles Hallé and Dr. Hans Richter. In a similar style is the Royal Exchange (1868-74), one of the most spacious erections of its kind. The area of the great hall is 5,170 square yards. The Assize Courts by Alfred Waterhouse, the architect of the Town Hall, were built in 1864, at a cost of £100,000. Immediately to their rear is the county jail. The University buildings are also by Waterhouse. The John Rylands Library, by Basil Champneys, is perhaps the chief architectural gem of the city. Other examples of street architecture worthy of attention are the City Police Courts, the Corn Exchange, the Inland Revenue Offices, the Post-office, new Fire Brigade Station, Reform and Conservative Clubs, and many of the banks, insurance offices and warehouses. The Municipal School of Technology is one of the most striking examples anywhere of a well-equipped school in an imposing building.

Educational Institutions.—Manchester University (q. v.) was reconstructed as an independent corporation in 1903. It was originally founded as the Victoria University in 1880, with a federation of the Owens College, Manchester, and the University College, Liverpool, as its colleges, to which the Yorkshire College at Leeds was afterwards added; but in 1903 a separate university charter was granted to

MANCHESTER

each city. The Owen College, which has now been incorporated with the university, was founded in 1850 by the aid of nearly £100,000 left by Mr. John Owens. It began work in a large house formerly occupied by Richard Cobden and was removed to the present fine buildings in 1873. Since then the Museum, Christie library, medical school, physiological and other laboratories, and the Whitworth Hall, have been added and the institution has benefited from many large gifts and bequests. There are 46 professors and about 130 lecturers. The splendid Municipal School of Technology is affiliated to the university and the subjects in the faculty of technology are taken there. The faculty of theology was instituted in 1904, and the co-operation of the various theological colleges was obtained. These include Baptist, Free-Methodist, Independent, Primitive Methodist, Roman Catholic, Unitarian, and Wesleyan colleges. The oldest educational institution in the city is the Grammar School, founded by Bishop Hugh Oldham in 1515. It has now about 900 scholars. Many distinguished names appear in the records of its alumni. Chetham's Hospital is named below. The following may be added: The Girls' High School, the Hulme Grammar School (founded by the Hulme trustees), the Nicholls Hospital, Warehousemen and Clerks' School, and the Royal Manchester College of Music, founded in 1893, as well as the numerous elementary and other schools.

Libraries.—Of libraries, the most recent, the John Rylands Library, is the most widely known, on account of its marvellous collection of rare and costly books and manuscripts. Its hundred thousand volumes embrace the Althorp Library, purchased from Earl Spencer, and Lord Crawford's collection of manuscripts. It was founded and endowed by Mrs. Rylands in memory of her husband and was opened in 1899. The Chetham Library dates from 1656, from which time it has been open free to all, and is part of the foundation of Humphrey Chetham, the other part being a hospital or school for poor children. The Public Free Libraries were established in 1852 and are supported by a public rate, which now yields nearly £30,000 a year. The chief or reference library contains 160,000 volumes and the 19 branch or lending libraries some 215,000 volumes. The Christie Library at the University was built by the late Mr. R. C. Christie, and on its shelves are the entire libraries of Mr. Christie himself, of Bishop Prince Lee, Professor E. A. Freeman, in addition to other special and general collections. The Medical and Law Libraries belong to the members of those professions, and there are other public and semi-public libraries of importance.

Art Galleries.—The City Art Gallery has been maintained by the corporation since 1882 and contains many fine examples of the British School, particularly works of Millais, Leighton, Holman Hunt, G. F. Watts and other modern artists. In this gallery, which formerly belonged to the Royal Institution, annual exhibitions have been held since 1827. The Manchester Academy of Fine Arts also holds its exhibitions here. Attached to the Municipal School of Art is a well arranged art museum, and in

the Whitworth Institute galleries in Whitworth Park, will be found a rich collection of pictures, including a nearly complete series of specimens of the best English water colors, from those of Sandby, Girtin and Turner onwards. The Institute is one of many benefactions enjoyed by Manchester from money left by Sir Joseph Whitworth.

Churches.—When the diocese of Manchester was founded in 1847 the Collegiate Church became the Cathedral. It is of unknown origin, but the present perpendicular Gothic building was raised, on an earlier foundation, about 1422. A large part has been rebuilt, mainly on the old lines, in recent years, yet many interesting portions of the earlier building remain. The ancient stalls in their choir have exquisitely carved canopies. The ancient parish consisted of 29 townships, including Salford, and some of them had chapels of their own. In 1850 the ancient parish was divided into independent parishes by Act of Parliament. Next to the Cathedral the oldest church is Saint Ann's (1712), which contains some beautiful windows by F. G. Shields. Many of the 19th century churches are of considerable pretensions. Besides 91 belonging to the Church of England there are 28 Roman Catholic churches and many others belonging to various sects. The Jews have 11 synagogues; and there is a Greek and an Armenian church.

Hospitals.—Hospitals to the number of 16, all maintained by voluntary subscription, are provided for the treatment of nearly every complaint to which the human frame is liable. The Royal Infirmary is the chief one. Saint Mary's Hospital and the Eye Hospital are others of large dimensions, while to the Hospital for Consumption is attached a Sanatorium at Delamere in Cheshire, which was provided at a cost of £70,000 by a local benefactor (W. J. Crossley). In addition there are several dispensaries and asylums, and a large number of charitable institutions of various kinds.

Societies.—The literary and scientific societies are many in number and of high standing. The Chetham Society and the Record Society devote themselves to the publication of historical records of Lancashire and Cheshire. The Antiquarian Society (1883) has similar objects. The Literary and Philosophical Society was founded in 1781, the Literary Club in 1862, the Statistical Society in 1833, the Geological Society in 1839, the Geographical Society in 1884. These, as well as the Microscopical, and some other societies, all publish their transactions. Musical societies are numerous and vigorous, and the artists, architects, lawyers, doctors, accountants, and men of other callings, have their own societies.

Public Works, Parks, Etc.—The corporation is the owner of the waterworks that supply Manchester and Salford and some surrounding towns and villages. The water comes from Longendale on the borders of Derbyshire, and Thirlmere in Cumberland, and the works have cost over £8,000,000. The average quantity of water supplied per day is 33,000,000 gallons. The gas works have been the property of the Corporation since the incorporation of the borough, and have always yielded a profit in aid of the rates. The supply of electricity is also

MANCHESTER

a municipal undertaking. So also the fire brigade, public abattoirs, the foreign animal wharf on the ship canal, cold-air stores, and the extensive sanitary works. The markets and the electric tramways are under municipal ownership. The city has 11 public parks and many open spaces and playgrounds. The area of the largest (Heaton Park) is 662 acres and its cost was £220,000. The other municipal works include baths, cemeteries, workmen's dwellings, infectious diseases hospitals, libraries, art galleries, technical school, and school of arts. The council are also the local education authority for the city. The construction of the ship canal involved an outlay of £15,000,000, one-third of which was lent by the Corporation, who appoint 11 out of the 21 directors of the Ship Canal Company.

Government.—Since 1838 Manchester has been governed under the Municipal Corporations Acts and a long series of local statutes. The council consists of 124 members, 31 of whom are aldermen. The head of the council is styled Lord Mayor, that title being conferred in 1893. For the administration of the affairs of the municipality, the council divides itself into 19 standing committees and several special committees. The administration of the poor law is entrusted to three boards of guardians, for the central and the North and South townships, and there are separate workhouses and other necessary establishments. There is a court of record for the trial of civil actions, established in 1838 and re-constituted in 1858, and now amalgamated with the court of record of the Hundred of Salford; and since 1839 there has been a separate commission of the peace, and separate quarter sessions. The assize, county, chancery, and other law courts held in the city are not under local control.

History.—Manchester was in prehistoric times occupied by the Britons, as proved by urns and implements that have been unearthed, and abundant Roman relics bear evidence to a long period of Roman occupation. Little is known of the rule of the English or Saxons, but among other traditions is that of Queen Ethelbega, wife of Ina, King of Wessex, having lived here in 689, and of the Danes sacking the town in 863. In 923 King Edward the Elder, son of Alfred the Great, rebuilt and fortified Manchester. Manchester is mentioned in the Domesday Book, 1086, as possessing two churches, one of which is now conjectured to have been at Ashton-under-Lyne, originally in the parish. The barony of Manchester was held by the Gresleys, 1086 to 1313, and the last of that family granted a charter to his burgesses in 1301, and it was by this charter that the town was governed for over five centuries. The manor was afterwards held by the De la Warres and the Wests until 1579 when it was sold to John Lacye, a London Mercer, for £3,000, who in turn disposed of it in 1596 for a profit of £500 to Sir Nicholas Mosley, a Manchester man, who had become a prosperous London merchant, destined to fill the office of Lord Mayor three years after his purchase of the manor. In his family the manor remained until 1845, when the whole of the manorial rights were purchased by the corporation for £200,000. One of the lords of Manchester, Thomas la Warre, entered the priesthood, became rector

of the parish, and in 1421 provided the means for collegiate the church, and gave his manor house as a residence for the clergy of the college. This house, now known as Chetham's Hospital, is, apart from the church, almost the sole architectural relic of feudal Manchester. After the Reformation the building was confiscated by the Crown, and in the reign of Edward VI. passed by purchase to the Earl of Derby. In his family it remained until the Commonwealth, when it was sequestered by the Parliament, with other possessions of the royalist Earl of Derby. In 1656 it was purchased by the executors of Humphrey Chetham and turned to its present uses. Manchester was visited in 1495 by Henry VII. It is unknown when the town began to be established as a trading and manufacturing centre, but it is clear from an Act of 1541, that a considerable commercial position had by that time been attained. Manchester holds an important position in the earlier history of the civil wars. At the outset the townsmen took the side of the Parliament, and made an effort to avert the conflict by presenting a petition to King Charles. The town was besieged by Lord Strange, who was repulsed. Prior to the actual siege, he demanded the delivery of the magazine, and in an affray which ensued a man was killed. This was on 15 July 1642, and the fatality was one of the first that occurred in the wars. The town was represented in Cromwell's first and second parliaments. In 1715 there were many Jacobites among the influential townsmen, and in the rising of 1745 the Young Pretender found numerous adherents here. Some of them, on the failure of the rebellion, were executed for their treason. The Duke of Bridgewater opened his canal from Worsley to Manchester in 1761, and the extension to Runcorn was completed in 1795. Distress, caused by the wars and high taxation, was a main cause of the political discontents which marked the first two decades of the 19th century, and are remembered by a weavers' riot in 1808, the "blanketeers" meetings in 1817, and the disastrous Peterloo affair of 1819, when, at a meeting to petition Parliament for the redress of grievances, several people were killed and many more injured during a charge of the military, after the reading of the riot act. The Manchester and Liverpool railway was opened in 1830, marking a new era in internal communication. Manchester was enfranchised by the Reform Act of 1832, getting two members. The Anti-Corn Law League was established in 1839, and prosecuted a vigorous campaign throughout the country, culminating in the repeal of the Corn Laws in 1846. In 1847 the bishopric of Manchester was created and the collegiate church converted into a cathedral. Queen Victoria paid three visits to Manchester, the first in 1851, the second in 1857, and the last in 1894, when she opened the Ship Canal. The great Art Treasures Exhibition in 1887 was held in 1857 and the Jubilee Exhibition in 1887. Both were remarkably successful, the latter yielding a profit of £43,300, which was devoted to public uses. From 1862 to 1865 there was great distress throughout the cotton manufacturing districts, owing to the American War, a relief fund of over a million of money was raised on behalf of the operatives. The Ship Canal

MANCHESTER

was projected in 1882 and opened in 1894. In March 1902 the city was visited by the Prince and Princess of Wales, who came to open the Whitworth Hall at Owens College; in July 1905 King Edward VII. opened a new dock at the Ship Canal.

Population.—The population of Manchester (1906) is 606,824. In 1841 it was 242,983, in 1871, 351,189, and in 1891, 505,368. The great increase is partially accounted for by the extensions of the city boundaries which took place in 1885, 1890, and 1904.

CHARLES W. SUTTON,

Chief Librarian, Manchester Public Free Libraries.

Manchester, Iowa, city, county-seat of Delaware County; on the Maquoketa River, and on the Illinois Central railroad; about 130 miles northeast of Des Moines and 45 miles west of Dubuque. It is situated in an agricultural region, and its excellent water-power is utilized in manufacturing industries. The chief manufactures are woolen goods, tiles, brick, fencing, flour, wagons, carriages, and dairy products. Manchester is the trade centre of a large part of Delaware, and the adjoining counties, and ships farm produce, dairy products, and live-stock. A United States fish hatchery is in the vicinity. Pop. (1900) 2,887.

Manchester, Mass., town, in Essex County, on Massachusetts Bay; and on the Boston & Maine railroad; about five miles southwest of Gloucester. The first settlement was made in 1630, and until 1645 the place was called "Jefrey's Creek," when the name was changed to Manchester and the town was incorporated. Since 1845 Manchester has been a favorite summer resort, one of the attractions being a Singing Beach. In addition to good public schools the town has a free public library in the Coolidge Memorial Library Building. Consult: Lamson, 'History of the Town of Manchester.'

Manchester, N. H., city, one of the county-seats of Hillsboro County; on the Merrimac River at the mouth of the Piscataquog, and on branches of the Boston & Maine railroad; about 17 miles south of Concord, the capital of the State, and 56 miles north of Boston. The first settlement was made in 1722, and for a number of years it was called Amoskeag and Harrytown. In 1751 it was incorporated as "Derryfield," and in 1810 the name was changed to Manchester. It was chartered as a city in 1846. The Amoskeag Falls (54 feet) in the Merrimac, above the city provides extensive water-power which by means of canals is made available for manufacturing. The city's prosperity is largely

dependent upon this water-power, which for years has been controlled by the Amoskeag Manufacturing Company. The city has over 400 manufactories, representing about 60 different industries. The capital invested is about \$25,000,000, and the number of employees about 16,000. The chief industrial establishments are the cotton mills, the Amoskeag, Amory, Manchester, and Stark mills alone have a capital invested of about \$14,018,000, and their annual output is estimated at \$11,000,000. Other manufactures are foundry and machine-shop products, (especially locomotives and fire-engines), hosiery, paper, boots and shoes, wooden-ware, needles, woolen goods, knit goods, leather, lumber, wagons, carriages, and furniture. The system of waterworks, owned by the city, has a reservoir of 16,000,000 gallons capacity which is fed from Lake Massabesic, a body of pure water about four miles from the city. The works were completed in 1874 at a cost of \$600,000. Some of the principal public buildings are the Government building, the Roman Catholic Cathedral, the county court-house, Sacred Heart Hospital, Hospital of Our Lady of Lourdes, and a public library, which contains about 46,000 volumes. The several public parks are well kept and add much to the attractive features of the city. The city has the State Industrial School, Saint Joseph's and Saint Patrick's orphanages, and Saint Patrick's and Saint Vincent's Homes for the Aged. The educational institutions are a public high school, three parish high schools, a number of grammar and elementary public and parish schools, a training-school for teachers, Saint Augustine's and Saint Mary's academies, and Saint Anselm's College. There are five national banks with a combined capital of \$750,000, and six savings banks, with a surplus of \$855,500. Pop. (1890) 44,126; (1900) 56,987.

Manchester, Vt., village, one of the county-seats of Bennington County; on the Battenkill River, and on the Bennington & Rutland railroad; about 32 miles south by west from Rutland. Manchester was one of the disputed places in the early days, when what is now Vermont was nearly all owned by New Hampshire, but a part by New York. In 1761 Manchester was incorporated as a town and as a village in 1900. It is situated in a beautiful locality near Mount Equinox, which is 3,816 feet above the sea. The village is in a fertile farming section, where dairy products are a chief source of income. An excellent quality of marble is found in the vicinity, and the forests furnish a considerable amount of timber for the lumber mills. The water from mineral springs nearby is shipped to many parts of the country. Fishing rods and ginger champagne are manufactured extensively. It is the seat of the Burr and Burton Seminary, and has the Skinner Memorial Library, which contains about 17,000 volumes. A large part of the sidewalk of the village is made of marble. Manchester is a favorite summer resort. Pop. (1900) 1,955.

Manchester, Va., city, in Chesterfield County; on the James River and on the Atlantic C. L., the Seaboard A. L., and the Southern R.R.'s. It is opposite Richmond, with which it is connected by several bridges. It is situated in an agricultural and coal region; and its industries are connected largely with the products of the farms and mines. At Manchester there

MANCHESTER CANAL — MANCHESTER UNIVERSITY

is a fall in the James River of 100 feet in about six miles. The extensive water-power is used for manufacturing in both Richmond and Manchester. Its chief manufacturing establishments are foundries, cotton mills, flour mills, woodenware factories, brick yards, paper mills, tanneries, and the repair shops of the Southern railway. The city owns and operates the waterworks. Pop. (1900) 9,715.

Manchester Canal, England, a great ship-canal, by which Manchester (q.v.), an inland town, was virtually converted into a seaport. The canal works were begun 11 Nov. 1887 and traffic was fully started in the beginning of 1894, the canal having been opened over a part of its length in 1891. The canal is 35½ miles long, the seaward end being at Eastham on the south side of the Mersey estuary, where three large locks have been constructed. There are locks on other portions of the canal, Manchester being situated 60 feet above sea-level. The minimum width of the canal at bottom is 120 feet, the maximum 170 feet; the minimum width at water-level is 172 feet, the maximum 230 feet; the minimum depth is 26 feet, on the lock sills it is 28 feet. From Manchester to Warrington the canal follows generally the course of the Irwell and the combined Irwell and Mersey, the river being deepened, widened, and straightened, where this was deemed advisable. In the lower part of its course the canal becomes semi-tidal, and from Runcorn onward it runs along the southern bank of the Mersey estuary, parallel with and near the river. At one point the Bridgewater Canal crosses the Manchester Canal, by a swinging caisson capable of being revolved while full of water to let a vessel through that has masts too high to pass under. The contract for constructing the canal was let at \$26,750,000, but the company had to raise a sum of over \$75,000,000 as capital. Of this sum Manchester contributed \$25,000,000, stipulating for unconditional control by a majority of the directorate. The total amount of excavation in the canal and docks was about 45,000,000 cubic yards, one-fourth being sandstone rock.

Manchester University. This University, officially styled the Victoria University of Manchester, has grown out of the Owens College, which was founded under the will of John Owens, a Manchester merchant who died in 1846, leaving £96,654 for the foundation of a college which should be free from religious tests. It was opened on 12 March 1851 in a house in Quay street, formerly the residence of Richard Cobden, with a staff of five professors and two teachers. It was originally governed by trustees under the founder's will, but by Acts of Parliament, passed in 1870 and 1871, a new governing body was formed. The first principal was Mr. A. J. Scott, who resigned in 1857, and was followed by Dr. J. G. Greenwood, who held the office for 32 years. In 1889 Dr. A. W. Ward was appointed, and at the end of 1897 he was succeeded by Dr. Alfred Hopkinson.

About 1870 a movement was started to provide a new site and buildings for the college, and a fund of about £100,000 was raised. The new college in Oxford Road, built from the designs of Mr. Alfred Waterhouse, was opened in 1873. Many subsequent additions have been made, including the Medical School, the Beyer

Laboratories (natural history), the Museum, the Whitworth Engineering Laboratory, the Schorlemmer Laboratory (organic chemistry), the Christie Library, the Physical Laboratory, the Schunck Chemical Laboratory, the Whitworth Hall, and the Bacteriological Laboratory in connection with the department of Public Health.

In 1872 the Manchester Royal School of Medicine was amalgamated with the College, and has become a most important department, being now one of the greatest medical schools in the country.

The library contains 100,000 volumes, and includes the entire collections of Dr. R. C. Christie, Dr. E. A. Freeman, Professor Milnes Marshall, and other eminent scholars. The library building was erected by the munificence of Dr. Christie, who had been Professor of History in the college.

The Museum building was erected in 1884-5. It originated in the gift of the collections of the Manchester Natural History Society and the Manchester Geological Society, together with the proceeds of the sale of their museum building. Under the direction of Dr. W. E. Hoyle, the curator, it has become one of the completest and best arranged natural history museums in Great Britain. It is open free to the public, and its management is vested in a committee of representatives of the City Council and of the subscribers as well as of the university.

There are four halls of residence, two for men and two for women, for the benefit of students living at a distance from Manchester.

By the generosity of benefactors the students are provided with a gymnasium and a spacious athletic ground. A striking instance of the popularity of the college was shown in 1902, when its jubilee was commemorated, by the raising of a fund of £102,500, out of which the debts of the college were paid and the general endowment increased.

The idea of elevating the college to the rank of a university was first broached in 1875 by Professors Greenwood, Morgan, Roscoe, and Ward, but when memorials for a charter were in 1877 presented to the Privy Council, opposition was made by the Yorkshire College, Leeds, and by other bodies in order to prevent a university charter being conferred on Owens College alone. It was finally agreed that the new university should bear the title of the Victoria University, and that while Owens College should be the first college of the university, yet provision should be made for the admission from time to time of other colleges. The Royal Charter creating the university was granted on 20 April 1880. University College, Liverpool, was admitted as the second college on 5 Nov. 1884, and the Yorkshire College as the third college on 3 Oct. 1887. It provided that the university should have its seat in Manchester, and that the meetings of the University Court and Council and of the Convocation should be held in that city. A subsequent charter, dated 20 March 1883, gave power to confer degrees in medicine and surgery.

A movement began in 1902 in Liverpool for the foundation of a separate university for that city, and thereupon the Owens College presented a petition for the reconstruction of the Victoria University as an independent university for Manchester. Both petitions met with favor by

MANCHESTER CANAL — MANCHURIA

the Privy Council and the new charter of the Victoria University of Manchester was granted on 15 July 1903, and on 24 June 1904, an Act for the incorporation of the Owens College with the university received the Royal Assent. Leeds obtained its own university charter on 25 April 1904.

Under the present constitution the authorities of the university are (1) the Chancellor; (2) the Vice-Chancellor; (3) two Pro-Vice-Chancellors; (4) the Court of Governors, which consists of 96 members; (5) the Council, which is an executive body and consists of 20 members, including four representatives of the Senate; (6) the Senate, 43 members; (7) the Board of Faculties; (8) Convocation, which now consists of 958 members.

The following are the various Faculties: Arts (degrees B.A., M.A., Litt.D.); Science, with a special department of education (degrees B.Sc., M.Sc., D.Sc.); Law (degrees LL.B. and LL.D.); Music (degrees Mus.B. and Mus.D.); Commerce (degrees B.Com. and M.Com.); Theology (degrees B.D. and D.D.); Technology (degrees B.Sc.Tech. and M.Sc.Tech.); Medicine (degrees M.B., Ch.B. (*i.e.* Bachelor of Surgery), M.D. and Ch.M.). In the Dental Department there are degrees of B.D.S. and M.D.S., and in the Department of Public Health diplomas are granted (D.P.H.) as well as D.V.S.M., *i.e.* Diploma in Veterinary State Medicine.

The teaching staff consists of 43 professors and about 160 lecturers and assistant lecturers, in addition to assistants in the Municipal School of Technology, where most of the technological subjects are taught.

The capital of the university amounts to about £1,000,000, including £416,000 value of buildings, etc., and the annual income to over £60,000, derived from endowments, government grants, grants from the city of Manchester and other municipal bodies, and from fees.

C. W. SUTTON,

Chief Librarian, Manchester Public Library.

Manchuria, mǎn-choo'-ri-a, China, comprises the northeasternmost portion of the empire, called by the Chinese TUNG SAN SHENG, 'Three Eastern Provinces,' from its administrative divisions, Hilung Kiang, the northern province; Kirin, the central province, and Sheng-King, the southern province. It lies mainly between lat. 40° and 53° N. and lon. 118° and 135° E., and is separated from Asiatic Russia on the north and northeast by the Amur, on the east by the Usuri, and on the northwest by the Argun. On the west it is bounded by Mongolia and China proper, part of the boundary being the Palisade Barrier, separating it from the province of Pe-chi-li; on the south the boundaries are the Liao-tung Gulf, the Strait of Pe-chi-li, Korea Bay, the Yalu River, and Korea. The estimated area is 363,670 square miles. Vast chains of mountains ramify all over the country, one of them forming the south limits of the valley of the Amur. The principal rivers are the Amur; the Argun; the Sungari, the vast basin of which occupies a great part of the territory; the Usuri, like the Sungari, a tributary of the Amur; and the Liao-ho, flowing south into the Gulf of Liao-tung. The Nonni is an important southward-flowing tributary of the Sungari, and the Hurka or Khurkha joins the

same river from the south. The climate is in most parts healthful and invigorating. In the northern and more elevated parts the cold of winter is intense, the thermometer sometimes falling to 48° below zero, and the snow lying for six months in the year. The summer temperature reaches about 90° in the shade.

The vast forests of the north are rich in useful timber of all kinds, such as walnut and oak, together with the soft pine and fir. They abound in wild animals, the tiger, panther, bear, wolf, and stag, as well as the eagle and other birds of prey. The rivers abound with fish. The soil is exceedingly fertile, especially in the valleys of the Liao and Nonni rivers. In the summer the southern part looks to an American much like Illinois, and one may find on its most northern hills lilies-of-the-valley, pink peonies, white and yellow daisies and the fragile dog roses, as in Wisconsin and Minnesota. With the exception of four ice-locked months its fields are luxuriant with wheat, barley, and millet, so that it has come to be called the "Garden of China." In the warmer portions the grape vine, indigo, cotton, opium, tobacco, sorghum, rice, ginseng, etc., are cultivated, the opium poppy being a valuable crop. Oleaginous beans are extensively grown for the oil yielded by them, and form the staple articles of export. The silkworm also is reared. The mineral wealth of Manchuria is great, but as yet is little developed. Iron, gold, silver, coal, peat, etc., occur in abundance. The Manchus are a Tungusian race. They are of a lighter complexion and a more powerful build than the Chinese, have the same conformation of the eyelids, but their countenances are far more expressive and intellectual. In the 17th century they invaded China, and placed their leader's son upon the throne. Since that time the Manchu dynasty has continued to reign in China, the Manchu language being the court and official language. Manchuria possesses a native population of 22,000,000, of whom 12,000,000 inhabit the southern province of Sheng-King, 8,000,000 the central province of Kirin and 2,000,000 the wild northern province of Hilung Kiang. A great immigration from Russia, China, Korea and Japan, took place especially after the Russian occupation in 1900. (See CHINA, paragraph *Events of 1902-3*.) For a considerable time prior to 1891, when the first sod was turned for the construction of the great Siberian railroad, the Russian government was anxious to secure control of this territory. When Japan in 1895 occupied the Liao-Tung Peninsula of Manchuria and began to fortify Port Arthur as its southern tip, Russia, with two other powers protested. Weak, though victorious, Japan withdrew, shortly afterward to learn of the secret treaty of Count Cassini by which Russia leased Port Arthur from China for twenty-six years. Having obtained this foothold, the Russians cast covetous eyes on the vast territory which lay between, and under the commanding influence of Admiral Alexieff, generalissimo of the Russian military and naval forces in the Far East, who, in 1903, for his services was proclaimed by imperial ukase Viceroy of Greater Russia and Lord of all the lands which lie between Baikal and the Pacific and which extend from the Arctic to the Yellow Sea, they accordingly began a pacific conquest by colonization on

MANCHURIA

an unparalleled scale. The route of the Siberian railroad was originally surveyed with Vladivostok on the Pacific coast of Russian Asia as the terminus. Port Arthur, however, washed by the warmer waters of the Yellow Sea, now became the coveted goal.

A corporation known as the Russo-Chinese Bank was established, which to all appearances was a mutual combination of Russian and Chinese capital. Although the bank was only another name for the Department of Finance of the Russian empire, yet its name pleased Mongolian vanity and won respect, the Chinaman having as great esteem for a banker as he has contempt for a soldier.

There were times when China was short of ready cash, and the Russo-Chinese Bank each time went to her aid. Therefore when China was asked to grant a concession for a railroad from the Siberian trunk line to Liao-Tung Bay, and the Russo-Chinese Bank offered to furnish the necessary \$250,000,000, China could not well refuse. With the same discretion with which the bank was named, the railroad was called the Russo-Chinese railroad. On its stationery were the grouped flags of China and Russia. These flags also appeared on the cars and engines, and on days of popular festivity they floated over the depots.

After the road was built some Chinese awakened to the railroad's true purpose. They discovered that it penetrated the most fertile as well as the most densely populated districts of Manchuria, and had for its terminus the Russian fortress of Port Arthur. On the north it joined with the Siberian trunk line at Harbin, on the mighty Sungara. It passed through the cities of Tsitsihar, Kirin and Mukden, capitals of the three Manchurian provinces. It tapped the Gulf of Liao-Tung, by means of the port of New-Chwang, and skirted the whole eastern coast of this arm of the Yellow Sea.

When the other powers became alarmed at the armies of soldiers which kept pouring in with every train from Siberia and European Russia, the officials of the Czar explained that they were simply "railway guards," and, to further prove that their presence was wholly warrantable, they pointed to a sentence of the railroad's charter, which permitted Russia to guard the railway with troops, but did not limit their number. Faster than the soldiers, however, came the colonists. Families were gathered from all parts of the Czar's western dominions, and put aboard trains of the Siberian railroad at Cheliabinsk, the border town between European and Asiatic Russia. They were charged nothing for transportation. Their wants were cared for on the way. At each railroad station along the 6,000 miles of track there was hot water and fuel where they might cook, and markets of wooden sheds where they might buy food from the peasants at low cost.

Every inducement now was held out to the Russian settler. To each male member of the household was given 100 acres, and oftentimes a man who had a large number of sons assumed ownership of more than a square mile. In addition to the land the government furnished the settler with agricultural implements, carpenter tools and cattle, and even advanced him money, to be repaid at an insignificant rate of interest.

But although immigration amounted to

nearly 200,000 a year, it did not penetrate far from the railroad. The region is too vast.

Consequent on the Boxer massacres and troubles of 1900 a Russian military force occupied the right bank of the Amur River, declared it to be Russian territory and established a provisional Russian administration. On 8 April 1902 the Manchurian convention between China and Russia was signed, wherein Russia agreed to evacuate Manchurian territory within 18 months. But Russia could not then voluntarily withdraw. The civilization of the Slav had rooted itself too firmly in this soil to be eradicated except by a political cyclone. One could see everywhere, from Port Arthur at its extreme southern end to the Amur River, the old Russian boundary, on the north, evidences of the Muscovite occupation. Under the direction of Russian engineers native laborers were building railroads and military highways, constructing wharves, marking out vast farms and laying out cities. The Russian fortress was found wherever a strategic site would make Russian cannon still more formidable, and almost in the shadow of these guns rose the peaceful sanctuaries of the Orthodox Greek, with their white walls and green roofs and cupolas.

For the purpose of supplying her thousands of colonists with a great seaport and commercial outlet, Russia had built the city of Dalny (q.v.), 14 miles from Port Arthur, on the eastern side of the Liao-Tung Peninsula. Engineers built its wharves, laid out its streets and even planted trees along driveways intended for pleasure vehicles before the inhabitants arrived. The population grew rapidly and the lines of the steamships which load here directly from the cars of the Siberian railroad increased in number and in frequency of service, while bids were received at Port Arthur by the Russian authorities for the construction of electric light plants and electric railways for Mukden, Harbin and New-Chwang.

On 8 Oct. 1903 the Russian government was pledged to evacuate Manchuria, yet when that day came she only poured in more soldiers, and made a great naval demonstration, her actions creating international uneasiness.

For Japan and Great Britain from political as well as commercial motives, and the United States on account of commercial rights obtained by the Shanghai treaty to trade freely with Manchuria, were particularly interested in insuring the integrity of the Chinese Empire, its administrative control over its Manchurian provinces, and the maintenance of the principle of the "open door." Furthermore, Russia added to the trouble which was brewing over her continued occupation of Manchuria, by opposing Japan in refusing to allow Korea to open the port of Wi-ju to foreign trade, or to permit Japan to lay a telegraph line from Seoul to Fusan, Russia, however, obtaining from the Korean government, a timber-felling concession south of the Yalu, and also having a telegraph line in working order in Korean territory. Japan had great interests at stake. Russia in Manchuria was a constant menace to the independence of Korea, over the suzerainty of which Japan had successfully fought China in 1894-5.

Japan, in assimilating all that was best of Occidental civilization, had learned all that was worth learning of European diplomacy, and

MANCHURIA

by treaty revision and her correct attitude during the Chinese War and the Boxer troubles, had raised herself and been admitted to the rank of a civilized world power. Soon after Russia, with the aid of France and Germany, had secured a diplomatic victory over Japan in obliging her to withdraw from the Liao-Tung peninsula, which she had occupied by right of conquest over China in 1894-5, Japan had effected a defensive and offensive alliance with Great Britain, whereby that power was pledged to intervene in any future conflict, should any third party again interfere with Japan's political arrangements. Already in July 1893 Japan had opened negotiations with the Russian Government "with a view to a friendly definition of the interests of the two countries in Manchuria and Korea where those interests meet, and thereby to remove every cause of conflict between Japan and Russia." She now redoubled her efforts in that direction. Russia, it is alleged, unduly delayed her replies, or proposed such amendments as were altogether inconsistent with Japan's idea of an amicable settlement, thus making the situation more and more complicated.

Besides, Russia made great naval and military preparations, despatching all her most powerful war vessels to the extreme Orient and sending military reinforcements to Manchuria and the neighboring regions. Japan, having made all necessary preparations for self-defense, and believing further delay would increase her danger, concluded to break off negotiations with Russia, and accordingly, on 5 Feb. 1904 telegraphic instructions were issued to the Japanese Minister at Saint Petersburg to announce to the Russian Government that Japan had terminated negotiations relative to the proposed Russian convention; that they would take such independent action as they might deem best to defend and consolidate their established rights and legitimate interests, and that they would sever diplomatic relations with Russia and withdraw their legation. The communication was made to the Russian Government the following day.

Russia, on the other hand, claims that her negotiations with Japan were conducted with the object of reaching an amicable and an honorable adjustment of their differences; that she had no reason to expect war, and as a proof of this assertion points out the fact that she was not prepared for war; had she expected war, no consideration would have induced her to withdraw her troops from the Chinese territory and thus lose the opportunity of ending the war quickly. While faithfully adhering to the terms of her treaty regarding Manchuria, she had withdrawn the major part of her troops from that province. Russia claims to be fighting to defend her position in the Far East—for vast interests which it would be foolhardy for her to abandon. Having acquired her present foothold in this Chinese province through the pacific channels of diplomacy and not through the right of military conquest, as is generally supposed, Russia's purpose was to develop Manchuria, and to reclaim an unproductive waste. China, of her own free volition, conferred upon Russia permission to build a railroad through Manchuria to Port Arthur, and it was from Russia that China obtained a loan of \$100,000,000 to pay the war indemnity to Japan. Another friendly

act on the part of Russia, in co-operation with France and Germany, was to save to China the Liao-Tung peninsula, which Japan had seized as a part of the spoils of victory. Upon the basis of the right to commercial exploitation thus peaceably obtained, Russia built a railway into and through Manchuria; she built bridges, roads, and canals; she built cities, whose rapid construction and wonderful strides in population and industry have no parallel in Europe or Asia, perhaps even not in America; Harbin and Dalny are monuments to Russian progressiveness and civilization; these undertakings cost Russia more than \$300,000,000, and to have abandoned them in the face of the menacing attitude of Japan would have been an act of stupendous folly. Had the menace not existed, and had China not failed to offer satisfactory guarantees of adequate protection to Russia's interests in Manchuria, Russia would have cheerfully continued to carry out her arrangement with China for the withdrawal of her Imperial forces from Chinese territory; if the Russian army was sent to Manchuria, it was solely for the purpose of protecting her interests from the destructive designs of the fanatical hordes of soldiers and Boxers whose rallying cry was "death to all foreigners"; had not Russian troops gone into Manchuria, that province would doubtless have witnessed scenes of carnage, pillage, and wanton destruction that would have created a sensation throughout the world. Russia restored order in Manchuria; she held her military forces there pending an adjustment of the differences between China and the powers. In the progress of the negotiations begun in the summer of 1903 between Petersburg and Tokyo, Russia claims to have showed a most conciliatory spirit; she modified her terms time and again, so intent was she upon preserving the peace. Having made marked concessions solely in the interest of peace, Russia awaited the Japanese answer, but before the Russian minister at Tokyo could deliver his reply, the Japanese answer came in the shape of a torpedo attack at midnight.

Meanwhile, early in January, the Chinese Emperor signed a new commercial treaty with the United States, which conferred on all powers new trade privileges in Manchuria, and also signed a similar treaty with Japan. This action, notwithstanding the Russian Government's apparent acquiescence, was violently assailed by the rigidly censored Saint Petersburg press, which denied the right of China to confer the privileges, declaring it impolitic for China to offer freedom of trade on territory not altogether its own, without previously obtaining the consent and permission of Russia, who would not permit its lawful rights to be interfered with. Notwithstanding, President Roosevelt nominated consuls for Mukden and Antung, the Manchurian cities now opened to trade.

In 1894 and 1895, Manchuria was the field of war between China and Japan; in 1900 it was the district in which the Boxer movement was most destructive, and now in 1904 it became the theatre of war between Russia and Japan. War commenced without a formal declaration on 9 February by the destruction in the harbor of Chemulpo, Korea, of the Russian ships *Variag* and *Koriyet*, which, after being ordered to leave, opened fire on the Japanese vessels under Admiral Uriu. The same night Japanese tor-

MANCHURIA

pedo boats made an attack on the unsuspecting Russian fleet in Port Arthur, disabling some of the best ships. Having gained practical control of the sea, the Japanese landed their armies, and by their brilliant naval and land campaigns, early in September 1904, had destroyed Russia's naval supremacy in Asiatic waters, involved Port Arthur in a protracted siege, and had driven the Russian army back on Mukden, the ancient capital of the Manchus and southern Manchuria.

Some of the more striking events of the war by sea were the persistent attempts of the Japanese admiral Togo to block Port Arthur, the blowing up of several Russian ships by mines, especially the destruction of the *Petro-pavlosk* 13 April, when the vessel sank with 800 men including Admiral Makarov, "the *Cosack* of the sea," and the war artist *Verevstchagin*; the blowing up of the Japanese battleship *Hatsuse*, and the ramming of the *Yoshimo* on 15 May, with great loss of life; the destructive raids of the Russian *Vladivostok* squadron on Japanese transports, and seizures of neutral vessels chiefly English and German, including the unwarranted sinking of the British ship *Knight Commander* which led to diplomatic complications with Great Britain; and the practical annihilation of the *Vladivostok* squadron by the Japanese admiral Kamimura 14 August, when it attempted to co-operate with a sortie of the Port Arthur fleet which also was hopelessly crippled by Admiral Togo, the Russian admiral *Wittshoeff* being among the killed, and the vessels driven back to Port Arthur, or forced to seek shelter in neutral ports. One in *Chefoo* harbor resisting a Japanese search party, was seized and taken out from Chinese protection, a breach of neutrality which the Japanese administration defended; while the *Novik* escaped to *Sakhalin* island where she was followed and destroyed by two Japanese cruisers.

By land, the Japanese armies led by Gens. Kuroki, Oku, and Nodzu, notwithstanding desperate Russian resistance, were irresistible in their onward progress. After a six days' fight, Kuroki on 1 May forced the passage of the *Yalu* near *Wiju* against the Russian general *Sassulitch*; Oku on 20 May stormed *Kinchow* and *Nanshan* hill, driving Gen. *Stoessel* and the Russians back on Port Arthur, and capturing *Dalny*; and while Gen. Nodzu beleaguered Port Arthur, Gens. Oku and Kuroki during a three-days' battle at *Telissu* (*Vafangow*), 14-16 June, defeated Gen. *Stakelberg*, whom Gen. Kuropatkin had detached with a force of 30,000 men and sent to the relief of Port Arthur. The Japanese occupied *Yinkow*, the port of *New-Chwang*, and on 25 July at *Tashi-chao* they again defeated the Russians, and occupied *New-Chwang*, the important treaty-port through which practically all foreign trade enters *Manchuria*, and an important base for the landing of further Japanese troops and supplies. The Japanese generals were now joined by Field-Marshal *Marquis Oyama* and his chief of staff Gen. *Kodama*. The Russians made heroic attempts to retard the Japanese advance, but were forced back on *Liao-Yang*, which Gen. Kuropatkin, the Russian commander-in-chief, had strongly entrenched and fortified, fully determined here to check the Japanese advance and to repair Russian military prestige. One of the fiercest battles in history began on 30 August,

and after three days of the severest fighting, Gen. Kuropatkin, endangered by a successful flanking movement of Gen. Kuroki, was compelled to abandon *Liao-Yang*, and retire on *Mukden*, the battle raging incessantly during the five days' retreat.

On 4 Sept. the Japanese army occupied *Liao-Yang* and began to fortify the city for use as a base of supplies. In the meantime they had completely surrounded Gen. *Stakelberg* and his force of 30,000 and his retreat had been cut off by Gen. Oku, but on 4 Sept. he finally succeeded in extricating himself and re-joined Kuropatkin, thus leaving the garrison at Port Arthur to defend the city as best it might without hope of a relief force ever reaching the city from the land side.

With the exception of some desultory fighting the armies lay dormant for three weeks, the Russians constantly receiving supplies and fortifying *Mukden*, while the Japanese entrenched themselves in the positions they had gained.

On 18 Sept. the Japanese began shelling the fortifications around *Mukden* and launched a series of small attacks against the Russian outposts but with no great gain to them. On 4 Oct. Gen. Kuropatkin assumed the offensive pushing the bulk of his army across the *Hun River*, along the main road toward the railway station and the *Yen-Tai* coal mines. Here he was faced by Gens. Oku with the Japanese left guarding the railway, *Nodzu* with the centre guarding the mines and the main road, and Kuroki with the right ready to flank any forward movement, only awaiting developments to make a dash to cut off retreat and hem the enemy in and thus inflict a crushing defeat. The Russian general evidently planned to break through between the right wing under Kuroki and the centre under *Nodzu* for the main attacking force was directed against *Nodzu's* division. This series of engagements, known as the *Battle of the Shakhe River*, lasted for 11 days from 6-17 Oct. and was marked by even heavier and fiercer fighting than was witnessed at *Liao-Yang*. The losses to both sides were enormous, though the Russian army was by far the heavier loser, their loss being officially placed at 45,000 killed, wounded, and missing while the Japanese loss was only 15,879. Though the Russian advance had been checked by the 9th, the Japanese were not able to press the advantage, the net result showed no gain to either contestant, and for several weeks after the serious fighting subsided both armies took a much needed rest, beside which the cold weather had set in and made operations extremely difficult.

During these months operations by land and by sea before Port Arthur had been carried on with varying success but the laurels generally resting on the Japanese arms. On 7 Aug. and the few days immediately following the Russian positions on the *Taku* and *Shaku* mountains were captured and the *Orlung* and *Keckwan* forts occupied. On 4 Sept. the minor forts east of *Golden Hill* were taken; by 19 Oct. several positions near the *Rihlung* Mountain had been taken and by the 26th the entire Russian outpost in this vicinity captured. Then for almost a month the operations consisted of small attacks by the besiegers and sorties

MANCHURIA

by the defenders, the final assault of the Japanese resulting in the taking of 203-Meter Hill on 2 Dec. This entailed a loss of over 15,000 men to the Japanese army but enabled them to mount their heaviest siege guns on a hill which commanded both the town and the harbor. This systematic bombardment forced the surrender by Gen. Stoessel, on 2 Jan. 1905, of the entire garrison and the ships within the harbor. The Russians had before the surrender lost about 25,000 men and of the naval force the battleships *Pobieda*, *Retvizan*, *Peresviet*, *Sevastopol*, and *Poltava*; the cruisers *Bayais* and *Pallada*; and the gunboats *Gihak* and *Amur* had been battered and sunk. With the surrender they further lost, in prisoners 23,491 men and 878 officers, including eight generals, four admirals, and 57 colonels, while 80 officers were paroled; 50 permanent forts; 546 large guns; vast quantities of all supplies and munitions of war; and with the destruction of the fleet all hope of gaining the supremacy on the sea. The Japanese loss consisted: in the navy of the battleships *Yashima* and *Hatsuse*, and the cruisers *Nisshin*, *Saiyen*, and *Miyako*—all by mines; the protected cruiser *Taka-sago*; the gunboats *Oshima* and *Atago*; and the destroyers *Akatsuki* and *Hayatori*; in the army of about 50,000 men during the entire operations. They had gained however, beside the supplies for land operations, 4 battleships, 2 cruisers, and 14 gunboats and destroyers, and command of the sea.

With the fall of Port Arthur, fighting was resumed by the armies at Mukden. Gen. Kuropatkin attempted to turn the Japanese left flank in the direction of Liao-Yang but after six days of severe fighting his attack was repulsed with a loss of 15,000, the Japanese loss being placed at 7,000. By the middle of February Marshal Oyama had been reinforced by an army of 100,000 veterans from Port Arthur under Gen. Nogi, who had come by forced marches to the scene of operations in the north. Another army under command of Gen. Kawamura had mysteriously entered the battle arena, having probably been operating under cover of the larger armies, between Kuroki and Vladivostok.

Thus the three armies under Oyama had maintained the same relative positions they had occupied during the march from Hai-Cheng northward. They had however been supplemented by two others: that under Nogi being placed on the west of Oku and forming the extreme left, and by that under Kawamura to the east of Kuroki and constituting the extreme right wing. Briefly stated the Japanese army consisted of the left wing under Oku and Nogi, the centre under Nodzu, and the right under Kuroki and Kawamura; in all a vast body about 400,000 strong, stretching crescent shape over 100 miles of plains and hills from Chang-Tau eastward across the railway to Lone Tree (Putiloff) Hill. The Russian army, numbering about 350,000, occupied all the strong positions and moreover was fighting on ground of its own selection. On 20 Feb. a general advance was made against the Russians, the fighting resolving itself into a game of flanking. Kuroki's right crossed the Sha-ho River, swung across the Russian left, attacked it in the mountains,

drove it from its positions and precipitated it in full retreat northward. Nogi, by 3 Mar., had driven in the Russian right wing, effected a junction between his right and the left wing of Oku's army about eight miles south of Mukden and proceeded to pound Kuropatkin's centre. While the armies of Oku and Nodzu drove a wedge through the Russian centre, Nogi's extreme left by a forced march of 40 miles also fell upon the centre, completely demoralizing it and almost annihilating a whole corps. By 5 Mar. the Japanese army was within five miles of Mukden; on the 8th Kuroki forced the Russians to retreat and evacuate all positions south and southeast of Mukden: on the 9th drove them toward Fushun, the railway between Mukden and Tieling was destroyed, and all the region west of the railway and south of the Hun River fell into the hands of the Japanese; on the 10th Mukden was occupied and the retreat had been turned into a rout; on the 11th the Fushun was captured and the Russians forced back to Tie-Pass, which by the 16th had fallen before the fierce onslaughts of the Japanese army.

This ended the Battle of Mukden proper. On 16 Mar. Kuropatkin was relieved of the command of the army and was succeeded by Gen. Linevitch. The retreat resolved itself into an attempt to save as many large bodies of troops as possible from being cut off and destroyed. By the 20th they had gone 27 miles above Tie-Pass, laying waste the lands as they went and thus hindering the Japanese advance so effectively that Harbin was reached by the remnants without further serious loss, though the rear guard was constantly harassed by the Japanese advance posts. The Russian loss at the Battle of Mukden was officially placed at 1,900 officers and 87,000 men, killed, wounded, and prisoners, and the Japanese loss was placed at 57,000. With the fall of Mukden, the Japanese captured 70 large siege guns, 60,000 rifles, many railroad cars and wagons, 2,000 horses and enormous quantities of ammunition, clothing and provisions.

On the capitulation of the Port Arthur garrison in January, the Japanese fleet under Togo was released from blockade duty and lay in wait for the Baltic fleet under Admiral Rojestvensky, which, after starting on 4 Oct. 1904, embroiling Russia with Great Britain by firing on a fleet of fishing smacks in the North Sea (22-3 Oct.), and wintering at Nossi-Bé, Madagascar, was by easy stages nearing the scene of conflict. On 8 April 1905 the fleet passed Singapore and, sailing for French Indo-China, anchored in Kamranh Bay, thus involving France in a dispute over neutrality, but a few days later sailed away and headed for the Korean Strait. Its progress had been watched by Admiral Togo who had established his base at Masampo, Korea.

At 6 o'clock on the morning of 27 May the Russian fleet was discovered near Quelpart Island, headed for Tsu Island, midway between the Japanese coast and the Korean Peninsula. Upon being informed that the Russian fleet was coming up the eastern channel, Togo moved his fleet eastwardly across the northerly end of Tsu Island, and turned south so as to bar the narrow strait, his inner line held by the battle-

ships under his immediate command, the outer line by the cruisers under Kamimura, while the light cruisers under Uriu were to the north on the lookout for stragglers. By a turning movement Togo placed his ships on the west, thus throwing the Russians to the east and placing the sun directly in their eyes. Shortly after 2 o'clock firing began and soon became general.

As the Russian fleet passed Togo's battleships, the squadron of light cruisers under Uriu broke in on them from the north while the heavier cruisers under Kamimura swung around to the south to head off any possible retreat. Thus they were surrounded, by Uriu on the north, Togo on the west, and Kamimura on the south, all, as they pounded them to pieces, driving them toward the coast of Japan. The fire from the Japanese ships was so effective that by Saturday night the battleships *Sissoi Veliki*, and *Borodino* were sunk. During the night the fleet of torpedo boats took up the awful work and when morning broke it was found that the battleships *Kniaz Suvarov*, *Alexander III*, *Oslabya*, and *Navarin*, the coast defense ship *Admiral Oushakov*, the armored cruiser *Dmitri Donskoi* and the protected cruiser *Svietland* had been torpedoed and sunk. On Sunday, the 28th, the armored cruisers *Admiral Nakhimov* and *Vladimir Monomakh*, which had been badly crippled during the night, were torpedoed and sunk near Tsu Island. During the morning *Admiral Nebogatov*, with five ships, attempted to escape to the north but they were overtaken near the Liancourt Islands and surrendered, the captured ships being the battleships *Nicholas I* and the *Orel* and the coast defense ships *Admiral Apraxine* and *Admiral Seniavin*. The other ship, the *Izumrud*, escaped but after running on a reef Monday night was blown up by her commander. Three cruisers, the *Oleg*, the *Aurora* and the *Jemchug*, under *Admiral Enquist*, escaped and reached Manila 3 June, where they were interned; the cruiser *Almaz* and three destroyers reached Vladivostok in safety; and one destroyer drifted into Shanghai Harbor on 4 June.

Thus it will be seen that the Russian loss foots up as follows: Sunk—six battleships, the *Sissoi Veliki*, *Borodino*, *Kniaz Suvarov*, *Alexander III*, *Oslabya*, and *Navarin*; three armored cruisers, the *Dmitri Donskoi*, *Admiral Nakhimov*, and *Vladimir Monomakh*; two protected cruisers, the *Svietland* and *Izumrud*; the coast defense ship *Admiral Oushakov*; and six destroyers; captured—two battleships, the *Nicholas I*, and the *Orel*; two coast defense ships, the *Admiral Apraxine* and *Admiral Seniavin*; and the destroyer *Biedovy*, on which was *Admiral Rojestvensky*; beside which the dead numbered over 7,000 and the prisoners over 4,000. The Japanese loss consisted of three torpedo boats; three officers and 113 men killed and 424 wounded. On 30 May *Admiral Togo* telegraphed that the battle was called the "Battle of the Sea of Japan."

The campaign on land was again vigorously pushed. On 16 June Liao-Yang Wo Peng, west of the Liao River, was captured and the Russians driven north after suffering a heavy loss. On 7 July the Island of Saghalien was invaded, this marking the first entry upon Russian territory proper, and after a

short but vigorous campaign, on 31 July the governor with 70 officers and 3,200 men surrendered, which with 500 surrendered and 200 killed on the 28th makes the total Russian loss on the island about 4,000; the loss to the Japanese was insignificant.

Meantime a sixth army under General Hasegawa began to invest Vladivostok from the west, a force was landed 17 July on the shores of Olga Bay, 150 miles north of the city to attack from that side and on 4 Aug. a fleet began the blockade of Peter the Great Bay on which the city is situated. In this position the armies were on 5 Sept. 1905.

Yielding to the earnest requests of President Roosevelt to stop the war if possible, both Russia and Japan consented in the latter part of June to hold a conference with peace a possible outcome. Baron J. Komura and Minister Takahira for Japan and Serge Witte and Baron Rosen for Russia were chosen as ambassadors with full powers to arrange terms of peace, and the Portsmouth, N. H., Navy Yard was selected as the meeting place. On 29 Aug. the plenipotentiaries reached a final agreement, the treaty was drafted and signed on 5 Sept. See PORTSMOUTH.

TREATY OF

Manchus, mǎn-ch'ooz', a name given the reigning family in China, members of whom sat upon the throne of the empire as early as 1644. They belong to the Tungusic type of Mongolians.

Mancini, mǎn-ch'ē'nē, a name borne by the five nieces of Cardinal Mazarin. They were born in Rome and summoned by their uncle to Paris, where they played a conspicuous part in the court of Louis XIV. during the early years of his reign. They were: (1) LAURE (b. 1636; d. 1657), the amiable and pious companion of Louis XIV.'s boyhood. She became the mother of Louis, Duke of Vendôme, one of the greatest generals of the Grand Monarque. (2) MARIE (b. 1639; d. about 1715), for whom the king conceived a violent affection, but in 1661 Mazarin gave her in marriage to Prince Colonna, constable of Naples. (3) OLYMPE (b. 1640; d. 1708), a witty and attractive woman, who became wife of Eugène de Savoie-Carignan, count of Soissons, and mistress of the queen's household. (4) HORTENSE (b. 1646; d. 1699), the most attractive and beautiful of the Mancini. In 1666 she left her husband, the Duke de Mazarin, and became one of the chief beauties of King Charles II.'s court. The king pensioned her, and after the revolution of 1688 she lived in retirement in Chelsea. (5) MARIE ANNE (b. 1649; d. 1714) was the wisest and most vivacious of the sisters. In 1662 she married the Duke de Bouillon, and her salon became the centre of social and intellectual life at Paris. She patronized La Fontaine, Corneille, and Molière. She died in Clichy.

Manco Inca I., ینگ'ka, Peruvian ruler; b. about 1500; d. 1544. He was the second son of the inca Huayna Capac (q.v.), who died about 10 years after the first arrival of the Spaniards, dividing his kingdom between his legitimate successor Huascar and a younger son, Atahualpa. The latter, after having made war upon Huascar, and put him to death, was himself captured and executed in 1533 by Pizarro. Shortly afterward

Manco appeared in the Spanish camp to announce his pretensions to the throne and claim Pizarro's protection. The conqueror received him cordially, and made it his first care after the taking of Cuzco to place him on the throne. After in vain petitioning for power to exercise the sovereignty, he withdrew secretly from Cuzco, but was brought back and imprisoned. Again escaping, he roused the whole nation to arms against the invaders, and appeared before Cuzco (February 1536) with a countless host of Indians who covered the surrounding hills. He destroyed a large part of the city by fire, and reduced the Spaniards to extremities; but after the siege had lasted over five months, had to withdraw on account of the scarcity of food. Defeated subsequently by Almagro, and forsaken by most of his warriors, he fled to the Andes, and for several years maintained his independence sallying forth as occasion offered at the head of a few brave followers, always eluding pursuit in the wilds of the Cordilleras, and in the event of civil war among the foreigners throwing his weight into the weaker scale in order to prolong their contests. He was killed by a party of Spaniards belonging to the younger Almagro's faction, who on the defeat of their leader had taken refuge in the Peruvian camp.

Mandæans, *mān'dē'anz*, an ancient Oriental religious sect of mixed Christian, Jewish, and heathen elements. They are still found on the east shore of the Tigris, working as jewelers, blacksmiths, carpenters, etc. Their religion is a kind of Gnosticism, retaining various Jewish and Parsee elements. They worship a number of personifications, particularly of the attributes or names of God. They publicly call themselves Sabians (*Subbā*, "baptists"), thus professing to identify themselves with the Sabæans tolerated in the Koran. They were formerly called Christians of St. John the Baptist from their habit of baptism or ablation. They have five important sacred books: '*Sidrā rabbā*' ('the great book'), called also '*ginza*,' 'treasure'; '*Sidrā de Yahyā*' ('Book of John'); the '*Qolasta*,' a collection of hymns; '*Diwān*,' a ritual; and '*Asfar Malwāsē*,' a manual of astrology. The Mandæans had three degrees in the priesthood, with a supreme official (*Rish ammā*) as the source of both civil and ecclesiastical authority. The priests officiate in white robes, barefooted, and women may be admitted to their order.

Mandaites. See NAZARENES.

Mandalay, *mān'da-lā*, East India, capital of Upper Burma; two miles from the left bank of the Irawadi, a little north of Amarapura (q.v.), the former capital, and about 410 miles north of Rangoon. It was founded in 1860, was the capital of independent Burma until its capture by the British in the end of 1885, and since the treaty by which (1886) the king lost his throne it has been the capital of Upper Burma. The area is six square miles. The most famous building in Mandalay is the Aracan Pagoda; it contains a brazen image of Buddha, 12 feet high. In the centre of the town stands what was once King Theebaw's palace. Outside the enclosures of the city was, until the British conquest, a crowded, dirty native town, now cleared away to make room for a British cantonment. The present native quarters lie outside the fortified city. Beyond them, again, on the slopes of the hills that border the valley of the Irawadi,

are numerous fine monasteries. Silk weaving is the most important of the industries; some of the others are gold and silver work, ivory and wood carving, bell and gong casting, and knife and sword making. In 1886 and in March 1892 much damage was done by fire and by an inundation of the river. In 1886 a meteorological observatory was built. Kipling (q.v.) called special attention to this ancient city by his poem 'Mandalay.' Pop. (1901) 183,816.

Manda'mus, in law, a writ issued by a superior court and directed to some inferior tribunal, or to some corporation or person exercising public authority, commanding the performance of some specified duty. In general practice in the United States a mandamus issues where a party has a right to have a thing done, and has no other remedy, and in some cases where he has another but a tedious and inadequate one; and must be applied for without delay. It is either in the alternative, ordering the court, corporation, or party to which or whom it is directed to do the thing specified, or to appear and show cause why it should not be done; or absolute, commanding the thing specified to be done without any condition or alternative. The writ is usually first issued in the alternative, and in case of there being no appearance, or no sufficient cause to the contrary being shown, an absolute mandamus is issued. The cases enumerated for the issuing of this writ are—to compel the party applying to be restored to some office or franchise of a public nature, whether temporal or spiritual; for the production, inspection, or delivery of public books and papers; to oblige bodies corporate to affix their common seal; or to compel the holding of a court. It may be directed to an inferior court, ordering it to proceed in the hearing of a cause, or to enter up a judgment.

Man'dan, N. Dak., city, county-seat of Morton County; on the Missouri River, and on the Northern Pacific railroad; about five miles above Bismarck. In the vicinity are extensive coal mines, and on the large ranches are raised cattle and sheep. Considerable wheat is cultivated on the farming lands. Nearby are a number of the ancient mounds somewhat similar to those in Ohio and other parts of the United States. The State Reform School and Indian schools are located here. The city is the headquarters of a railroad division and has large railroad shops. Pop. (1900) 1,658.

Mandan, a tribe of American Indians of the Siouan family, the remnants of which number less than 300, are settled upon the Fort Berthold Reservation in North Dakota. In 1778 the Mandans occupied nine villages upon both sides of the Missouri River near Saint Louis, but wasted by smallpox and decreased by numerous battles with the Sioux, they removed further up the Missouri. In 1804 they were found by the Lewis and Clark Expedition (q.v.) occupying two villages at the mouth of the Knife River. In 1837 when a smallpox epidemic destroyed thousands of American Indians the Mandans were still further reduced in numbers from 1,700 to less than 400. In 1846 the remaining families of the tribe took up their residence at the Fort Berthold Reservation. The Mandans were not a nomadic people, but resembled the Pawnees, living in log houses with village administration and local

government. They were an agricultural people, raising corn, tobacco and other crops.

Man'darin, the term usually applied in China by foreigners to government officials of every grade. It is supposed to be derived from the Portuguese *mandar*, to command, or from the Sanskrit *mantrin*, counsellor; the Chinese equivalent is *kwan*, which signifies literally a public character. There are nine ranks, distinguished by different buttons.

Mandarin Duck, a small Chinese duck (*Aix galericula*) closely related to the American wood-duck (*A. sponsa*), and dressed in an exceedingly beautiful plumage of metallic green, purple, chestnut, white and black. It has long been domesticated by the Chinese, and, as it is said to pair for life, is held up by them as a model of marital virtues; and it has been introduced upon park waters and ornamental grounds in America and Europe.

Mandat, mǎn-dǎ, the name given to a kind of paper-money in the French Revolution. After the assignats, which had been kept in circulation by the violence of Robespierre, had lost all credit, a new money was created—the mandats—founded, like the assignats on the credit derived from the confiscated property, but with the essential difference that specific pieces of property, enumerated in a table, were pledged for the redemption of the bills, while the assignats furnished only a general claim. These mandats were issued in accordance with the law of 1796, to the nominal value of \$480,000,000. A forced circulation was given to them, by which the government was enabled to defray the expenses of the approaching campaign.

Mandate, in law, a term derived from the Roman civil law. It may be defined as a bailment (delivery) of a chattel or chattels to a person who is to do something with or about the things bailed, entirely without compensation. The essential element of the contract lies in the fact that there is not paid or promised, in law or in fact, any compensation whatever for the service to be rendered. The person delivering the chattels is called a mandator; and the person receiving them and undertaking the service is called a mandatory. As it must be a service or an act, the whole benefit of which rests with the mandator, this, by the ordinary principles of bailment, determines the amount of care to which the mandatory is bound, and the degree of negligence for which he is answerable. For negligence in a bailee has in law three degrees: slight negligence, which makes the bailee responsible where the bailment was wholly for his benefit; ordinary negligence, for which he is responsible if the bailment be for the benefit of both parties; and gross negligence, for which only the bailee is responsible where the contract is for the exclusive benefit of the bailor. And as it is not a mandate if the bailee derives any benefit whatever from the service, it follows that a mandatory is responsible for loss of or for injury to the thing delivered to him, only when it is caused by his gross negligence. There is no especial form for the contract of mandate; it may be in writing or by word only, and made very solemnly or in the simplest way; in either case the law is the same. No man can be held in the United States for a breach of any promise, whether that breach be partial or total, if

the promise rests upon no consideration. But if he who has made a promise, afterward does some injury to the promisee (and this would be the case if he does something which is positively injurious because it is not completed), he is liable for the injury he has caused, as he would be if there were no promise between the parties. Banks and bankers are so far mandatories, that they receive notes for collection, and render, or engage to render, by agreement or by mercantile usage, these and similar services without any especial or specific compensation. But it is understood that they do this as a part of their business, and for the general and indirect benefit they derive from doing it; and this is undoubtedly consideration enough to make them liable for any injury to their customer caused by their negligence; and it is sufficient to make them liable that their negligence was ordinary, or consisted in the want of common care. And a bank has, as bailee, a lien on its deposits for its general balance against the depositor.

Mandaue, mǎn-dǎ'wǎ, Philippines, a pueblo of the province of Cebú, situated on the east coast, on the north shore of Cebú Channel, five miles northeast of the town of Cebú; it is on the coast road. Pop. 15,300.

Mandaya, mǎn-dǎ'yǎ, a Philippine tribe of the Malay race living in the commandancia of Bislig, and the district of Dávao, island of Mindanao. They are bloodthirsty, and head-hunters, mostly heathen, though Jesuit missionaries have converted some to Christianity. See PHILIPPINE ISLANDS.

Mandel, mǎn'dél, Eduard, German engraver: b. Berlin 15 Feb. 1810; d. there 20 Oct. 1882. He studied in Paris with Henriquel-Dupont, and in 1842 became professor of engraving at the Berlin Academy. He was one of the greatest of modern German engravers, the most important work of his being the plate of Raphael's 'Madonna di San Sisto,' his latest effort. Consult Pietsch, 'Eduard Mandel und seine Werke' (1883).

Man'derson, Charles Frederick, American lawyer and politician: b. Philadelphia 9 Feb. 1837. He received his early education in Philadelphia, removed to Canton, Ohio, in 1856, studied law and was admitted to the bar in 1859. He was city attorney in Canton 1860-1; at the outbreak of the Civil War he enlisted as a private in the Union army, served in the campaigns in the Middle West, and rose through the intermediate grades to the rank of brigadier-general of volunteers. He was severely wounded at the battle of Lovejoy's Station, Ga., and resigned from the army in 1865 on account of his wounds. He resumed his law practice in Stark County, Ohio, but removed to Omaha, Neb., in 1869. Here he soon became prominent in public affairs, was city attorney for more than six years, and a member of the Nebraska constitutional conventions in 1871 and 1874. In 1883 he was elected to the United States Senate, serving until 1895, and being chosen speaker pro tem in two Congresses, 1889-93. Since 1895 he has been solicitor for the Burlington system of railroads, west of the Mississippi; and was president of the American Bar Association in 1900-1. He has published 'The Twin Seven Shooters' (1902), and several addresses on political and legal subjects.

Mandeville, Bernard de, English writer: b. Dort, Holland, 1670 (?); d. London 21 Jan. 1732-33. He was educated at the Erasmus School, Rotterdam, and at the University of Leyden, where, in 1691, he received the degree of doctor of medicine. The date and occasion of his removal to England are unknown; but he appears soon to have settled in London where with but small success he practised his profession. He lived obscurely, with distillers and Dutch merchants as his ordinary acquaintances. Franklin, in his *Autobiography*, records that in 1725, at "the Horns, a pale-ale house in — Lane, Cheapside," he was introduced "to Dr. Mandeville, author of the 'Fable of the Bees,' who had a club there, of which he was the soul, being a most facetious, entertaining companion." Franklin at this time was merely a struggling young printer, unknown to fame: Mandeville gained no honor from his acquaintance. Mandeville had, however, a few acquaintances outside his tavern circle. Of these, the most important was Lord Macclesfield, the chief justice, at whose house Mandeville also met Addison. Of their world, however, Mandeville was never a real part, socially or intellectually.

Mandeville wrote much both in verse and prose; but his chief claim to notoriety was the authorship of the 'Fable of the Bees.' This, in its earliest form, consisted solely of a rude poem, in octo-syllabic couplets far from Miltonian, entitled 'The Grumbling Hive, or Knaves turned honest.' In it, he related how, so long as they remained unscrupulous, the bees increased in numbers and prosperity, and how by their moral reformation the bees gained only their material ruin. He concluded that

"To enjoy the world's conveniences,
Be famed in war, yet live in ease,
Without great vices is a vain
Utopia, seated in the brain.
Fraud, Luxury, and Pride must live,
While we the benefits receive."

Of this piece, the earliest known edition is that of 1705. Mandeville's assertion that an earlier edition was printed is unsupported by evidence. In 1714, Mandeville re-printed the poem with prose additions, the whole bearing the new title 'The Fable of the Bees, or Private Vices Public Benefits.' This he further enlarged in the edition of 1723.

At this point, the grand jury of Middlesex interfered, and, in July 1723, presented the 'Fable' as a nuisance. Immediately the book became a subject of general attack. Richard Fiddes and John Dennis in 1724, William Law, Francis Hutcheson in 1725-7, Archibald Campbell in 1728, and Bishop Berkeley in 1732, all assailed Mandeville in turn. By Law and by Berkeley, Mandeville was intellectually out-classed; but he held up his side of the argument, adding to his 'Fable,' in successive editions, tract after tract. That the 'Fable' should be thus attacked is not surprising. Its fundamental thesis, that private vices are public benefits, was as subversive of morality as its illustrative material was foul and its style plausible and forceful. Whether Mandeville was sincere or ironical in his argument is in dispute. That he thoroughly enjoyed his own foulness

cannot be doubted. But at least he accomplished one good thing; he pricked the sham morality of Shaftesbury.

ARTHUR H. NASON,
Instructor in English, New York University.

Mandeville, Sir John. The alleged author of a mediæval book of travels which enjoyed great popularity. A large number of manuscripts are in existence, the most important of which are in Latin, French, and English. The earliest version is in French, dating from the latter part of the 14th century, and upon this all the others appear to be more or less directly based. There is no English manuscript antedating the 15th century. The statements in the prolog regarding the translation are to be distrusted, and the autobiographical matter is contradictory. An exaggerated importance has sometimes been attached to the compiler of the work as the father of English prose, because of the statement in one of the English manuscripts that he had translated it out of French into English in order that every man of his nation might understand it. Errors in the translation prove that the man who wrote the French version and the man who made the English rendering cannot have been one and the same person.

The travels consist, in the main, of an account of the Holy Land, and the routes thither, followed by a description of various parts of Asia. The narrative is almost wholly spurious, being made up of paraphrases and borrowings from various sources—travel-books, bestiaries, works on Eastern manners, legends, romances, etc. The first half of the book is chiefly dependent upon the travels of William of Boldensele, a German who flourished in the 14th century, and the second part upon the work of Friar Odoric of Pordenone (ca. 1330). The only portions which may reflect personal experience are those dealing with Jerusalem and Egypt, which it is not impossible that the compiler may have visited. The story abounds in all kinds of adventures and marvels, related with an air of sober truth. There are accounts of monsters and curiously misshapen men, of regions haunted by devils, of the Fountain of Youth, of the Phoenix, of the realm of Prester John, etc. The narrator must have been a man of wide reading, and he certainly displays considerable skill in the selection and arrangement of his materials.

In the prolog the author states that his name is "John Maundeville, knyght," b. at Saint Albans in England, and that he "passed the see," in 1622 (1632), whereupon he traveled through various countries. The epilog asserts that the gout forced him to return, and that he occupied his leisure in writing his experiences. It has been found impossible to identify him with any historical John Mandeville.

The tomb of the reputed author of the 'Travels' was long shown at Liège, with an inscription to "Joannes de Mandeville, alias dictus ad barbam." Important in this connection is the testimony of one Jean d'Outremeuse, in a mediæval 'Myreur des Histors,' to the effect that there died in Liège in 1372, a physician named Jean de Bourgogne, "dit a la barbe," who declared himself on his death-bed to be "Jean de Mandeville, chevalier, comte de Mont."

fort en Angleterre," his real name having been concealed because of a crime committed in England. The veracity of D'Outremeuse is open to suspicion, but it has been thought that this Jean de Bourgogne may have been one John de Burgoyne, who was forced to leave England in 1322, and that he compiled the 'Travels,' borrowing the name of one John de Mandeville, who was concerned in the murder of Gaveston. At all events, Jean de Bourgogne was known in mediæval times as the author of a treatise on the plague, which is bound up in one instance with a version of the 'Travels.' It seems probable, then, that this man, whatever his past history may have been, was the real author of the latter work, and that he preferred to conceal his identity under the pseudonym of Mandeville.

Bibliography.—Texts ed. by Halliwell and by G. F. Warner (Roxburghe Club); articles in 'Dictionary National Biography' by Warner, and in 'Encyclopedia Britannica' by Yule and Nicholson.

WILLIAM W. LAWRENCE,
Instructor in English, Columbia University.

Mandingoes, män-dēng'gōz, a native tribe of West Africa, remarkable for their intelligence. The original country of this people was the north slope of the high table-land of Senegambia, between the head-waters of the Niger and Senegal. Their language is more widely diffused, and more employed by translators, than that of any of the other languages of West Africa. They formed at one time a single large empire, but are now widely scattered. Their religion is Mohammedan.

Man'dolin, a musical instrument, belonging to the lute species, played with a quill or plectrum as well as with the finger. It is of Italian origin, but latterly has become common in all civilized countries. In the usual form it has four pairs of metallic strings and a finger-board or neck with numerous frets across it. Operatic composers have occasionally employed the mandolin to obtain characteristic effects.

Man'drake, a genus of perennial herbs (*Mandragora*) of the order *Solanaceæ*. The species, of which only three are described, are almost stemless, thick-rooted, and large-leaved, with rather large whitish or bluish bell-shaped flowers, followed by globular berries. The plant is chiefly interesting from the numerous allusions to it in old writings, the superstitions relating to it being mainly in connection with its fetid, reputedly poisonous root, which, from a fanciful resemblance of its roots to the human figure, was considered an aphrodisiac.

The May-apple (*Podophyllum peltatum*), of the order *Berberidaceæ*, is often called 'mandrake' in the United States, where it is common east of the Mississippi River. It is a perennial herb which sends up umbrella-shaped leaves, usually two at the summit of a stem and bearing one or two creamy, fragrant flowers in the axil. A mawkish yellow fruit about the size of a large cherry develops during early summer. The fruits 'are relished by pigs and boys.' The creeping rootstocks have been used medicinally.

Man'drill, the largest, and one of the most repulsive and savage of the African baboons. See BABOON and compare DRILL.

Maned Wolf, a long-legged, slender-bodied, long-nosed, brightly reddish wolf (*Canis jubatus*) of eastern South America, which may be regarded as one of the 'aguaras' or fox-dogs (q.v.). It is a denizen of forests, not being known south of the northern edge of the Argentine pampas; and goes about alone at night and secretly, seeking its food, which consists mainly of small rodents, frogs, insects, and the like, and even some fruit. It will sometimes attack sheep, but is remarkably timid, and no one fears it.

Manes, mā'nēz, among the Romans, the souls of the dead. The good spirits were also called *lares*, and the evil *larvæ*. The manes were reckoned among the infernal gods; but a belief was prevalent that they sometimes appeared upon the earth in the form of ghosts, particularly on the 30th of August, 4th of October, and 7th of November; whence the Romans considered these unlucky days.

Manes Worship, from Roman *Manes* (q.v.), a term to denote the worship of the dead, whether of an ancestor of the particular worshipper or of some deified hero of his race. Herbert Spencer thinks it developed from the belief in an other self, which survived after death, and that manes worship was the outcome of a desire and endeavor to propitiate the ghost. Sir John Lubbock says of manes worship that it "is natural development of the dread of ghosts."

Manet, Edouard, ed-oo-är mā-nā, French painter: b. Paris 1832; d. there 30 April 1883. Sprung from a family of lawyers, he was destined for the same profession and sent to travel in South America to distract his mind from a youthful resolution to become a painter. But on his return to Paris in 1850 he insisted on entering the studio of Couture, from whom he seems to have received little inspiration; but after his travels in Germany, Holland, and Italy, and much study of Rembrandt, Tintoretto, Velasquez, and Goya he launched out into an entirely new style, which has been denominated Impressionism (q.v.). He emphasized what may be styled the light values of color (see VALUES OF COLOR) and disregarded the relative or corresponding values of conventional art. His breadth of treatment sometimes seemed to end in the flattest naturalism, and the influence of the photograph is manifest in all his pictures. In the Salon of 1861 he exhibited the 'Guitar Player'; and his next canvas, 'Breakfast on the Green,' created much discussion, from the daring manner in which the painter had grouped nude female figures with men in conventional dress. Being excluded from the Salon, he founded his "Salon of Rejected Pictures," and became the head of the new school of Impressionists. Among his most characteristic pictures are 'Boy with a Sword' (1860), in the New York Metropolitan Museum; 'Le Bon Bock,' a portrait of Belot, the engraver, drinking beer, which is familiar from many reproductions; 'The Garden' (1874), an open air scene, which reveals all the special features of the new school. His 'Buffet at the Folies-Bergères' reveals his tendency toward the portrayal of low life. He was also active in the execution of pastels, and illustrated Cros, Champfleury, and Poe. Consult: Zola, 'Edouard Manet' (1867); and Bazire, 'Edouard Manet' (1884).

MANETHO — MANGANESE

Manetho, Egyptian historian of the 3d century B.C. He was the first who wrote a history of his native country, and an account of the Egyptian religion, in the Greek language. His history was based on ancient Egyptian documents, and more especially on the sacred books of the Egyptians. It was divided into three books, the first of which gave the fabulous or mythological history of Egypt previous to the 30 dynasties, along with the history of the first 11 dynasties; the second, that of the 8 following dynasties; and the third, that of the remaining 11 dynasties from the 20th to the 30th, inclusive, ending with the reign of Nectanebus, the last of the native Egyptian kings. The period embraced by the pre-dynastic history was calculated by Manetho himself at 24,900 years, and that of the 30 dynasties at 3,555 years. The history of Manetho is lost, but the lists of the dynasties are preserved in Julius Africanus and Eusebius, and some fragments of the work are to be found in Josephus, in his work against Apion. The work of Manetho's on the religion of the Egyptians was entitled 'Tōn Physikōn Epitomē.' It is also lost. The only work bearing the name of Manetho which has come down to us is an astrological poem entitled 'Apotelesmatika,' and it is spurious. Consult: Boeckh, 'Manetho' (1845); Unger, 'Chronologie des Manetho' (1867).

Maney, George, American soldier and diplomat: b. Franklin, Tenn., 24 Aug. 1826; d. Washington, D. C., 9 Feb. 1901. He was educated at the University of Nashville, fought in the Mexican War (1846-7), in 1849 was admitted to the bar, and in 1849-61 practised law. On 1 May 1861 he became colonel of the 1st Tennessee infantry, and at Shiloh (6-7 April 1862) he commanded first his regiment and later the 2d brigade of the 2d division. Promoted brigadier-general for his conduct at Shiloh, he commanded the 3d brigade of Cheatham's division in Bragg's army at Murfreesboro (31 Dec.-3 Jan. 1863) and Chickamauga (19-20 Sept. 1863), subsequently was appointed to the command of Cheatham's division, and participated in the battle of Atlanta (22 July 1864). In 1876 he was nominated by the Republican party for the governorship of Tennessee, but before the election retired from the contest. He was minister to Colombia in 1881-3, and to Paraguay and Uruguay in 1889-93. In 1884 and 1888 he was a delegate to the Republican national conventions of those years. In 1868-77 he was also president of the Tennessee and Pacific railway.

Manfred, king of Naples and Sicily, 1258-66: b. about 1231; d. 26 Feb. 1266. He was a natural son of the emperor Frederick II., on whose death, in 1250, he became Prince of Tarentum, and acted as regent in Italy in the absence of Conrad IV., his half-brother. After the death of Conrad he was regent of the kingdom during the minority of his nephew Conradin. At the instigation of Pope Alexander IV. a crusade was preached against him, and Manfred was temporarily driven from his kingdom, which, however, he soon recovered, and on the rumored death of Conradin, had himself crowned king of Palermo, 10 Aug. 1258. The Pope at once excommunicated him and his followers, but Manfred marched into the papal territory and compelled acknowledgment as mas-

ter of Tuscany. Through matrimonial alliances for himself and his daughter he sought to increase his power, and his administration of the government was efficient, benign, and for a time prosperous. But the excommunication was renewed by Pope Urban IV., who also bestowed his kingdom on Charles I. of Anjou (q.v.), and a war ensued in which Manfred was finally defeated and killed at Benevento. After his death imprisonment and extreme cruelty were visited upon his widow and children.

Mangabey, mǎng'ga-bā, one of the odd West African monkeys of the genus *Cercocebus*, nearly related to the guenons and to the macaques. They are distinguished by the whiteness of the eyelids and the backward growth of the hair on the crown of the head. Some of the species are well-known, especially the sooty mangabey (*C. fuliginosus*) which always carries its long tail turned over its back. There are three or four species and they make docile pets.

Mangaldán, mǎn-gāl-dǎn', Philippines, a pueblo of the province of Pangasinán, Luzon, situated 12 miles northeast of Lingayén, the provincial capital. It is on the coast road, and is the meeting point of several roads extending to towns in the interior; and is on the route proposed for the railroad from Dagupan to Laoag. Pop. 16,150.
